

DHL Global Forwarding Standard EDI

Category	Term	Explanation
Transportation Protocol Standards Supported	VAN	Method of transporting information using an intermediary mail boxing service. DHL Global Forwarding preferred VAN is G-International/GXS (GEIS). The VAN provides a central point to use for distribution (receipt and delivery) of electronic business documents. Each company transmits its translated EDI data to the VAN, which then distributes the electronic documents based on a code inside the EDI document. Trading partners do not have to use the same VAN; a VAN can deliver documents to other "mailboxes" on its system, or route documents to another VAN, where the trading partner's mailboxes reside.
	AS2	Standardized method for transporting information over the internet securely.
