

# Kaspersky Security for Mail Server

## Building resilience against the number one attack vector

Email is the primary attack vector threatening business IT security. Attackers have increasingly sophisticated ways to infiltrate organizations through mail-based attacks, resulting in financial, operational and reputational losses. To counter these developments, businesses need to think about resilience as well as protection. By optimizing your resilience and minimizing your attack surface, you can make your business a less attractive and even unfeasible target for attackers. And the best point at which to deploy resilience-enhancing countermeasures is before unwanted emails come into contact with users and their endpoints.

## Build up your resilience at the number one entry point for attacks

Kaspersky Security for Mail Server applications help build resilience to mail-based attacks by:

### Identifying and filtering out suspicious or unwanted emails at gateway level

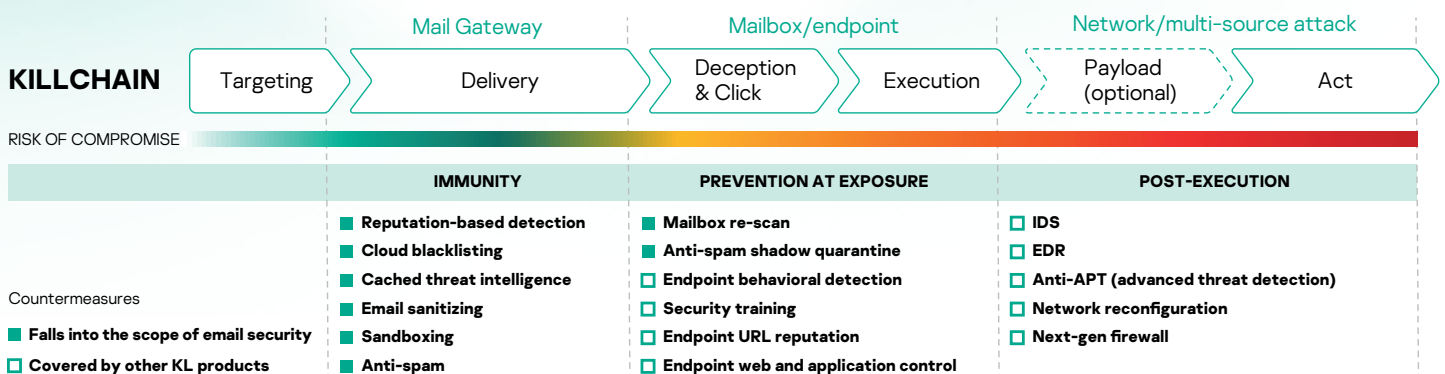

Most mail attacks only begin to activate at endpoint level – Kaspersky Security for Mail Server sets out to stop them long before they get that far. Our award-winning protection strengthens your resilience by detecting and intercepting attacks, right at first base, before they can breach your perimeter and head for your endpoints and users.

### Swiftly and accurately processing those that are wanted

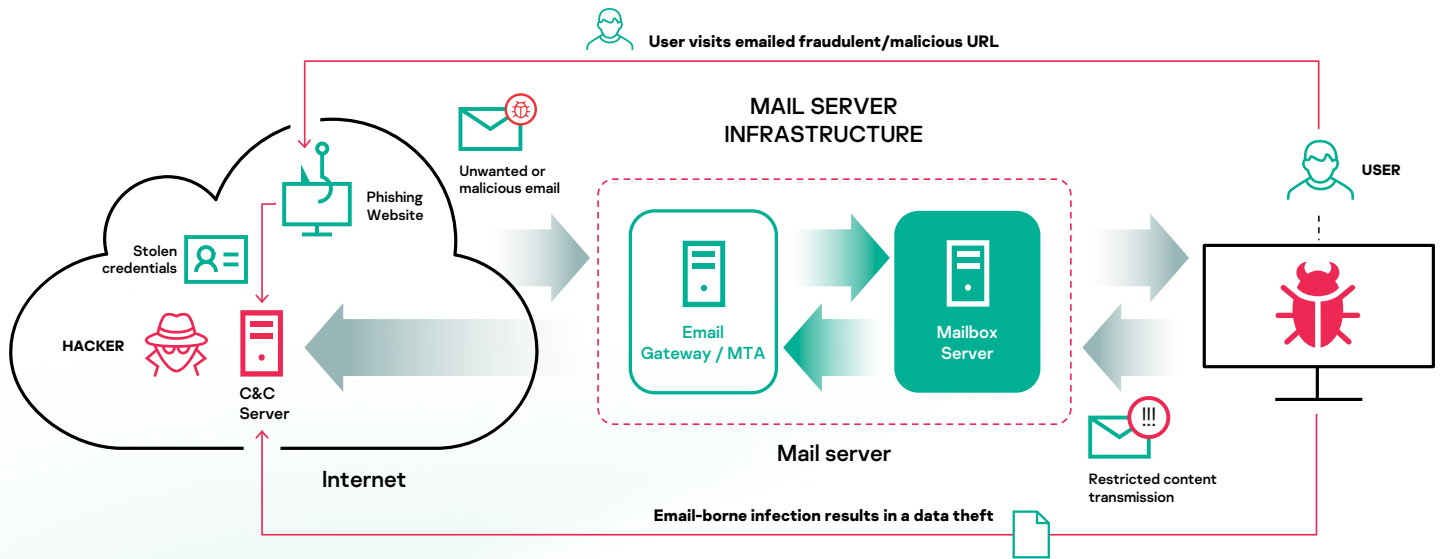

The core role that email plays in business communications means that security processing has to be fast, agile and accurate – without impeding legitimate communications. Kaspersky Security for Mail Server offers the most effective protection technologies in the industry against everything from phishing emails and spam to Business Email Compromise (BEC) attacks and ransomware, with near-zero false positives, while enabling legitimate emails to travel uninterrupted.

### Taking email protection beyond the gateway

Users must be protected, including from themselves – and the business must be protected from the consequences of user ignorance or error. Kaspersky Security for Mail Server detects the presence of malicious or undesirable content at individual inbox and outbox level on Microsoft Exchange Servers - including malware, phishing emails and potentially dangerous attachments, as administrator-configured policies dictate. In order to contain account takeover or insider threats, protection at the mailbox server level is highly recommended.

# Key features

*The email-based threats model*

## Multi-layered malware protection

Multiple security layers applied through deep learning networks stop the most complex email-borne malware - including cases of targeted ransomware, wipers and miners that are often assisted by spear-phishing. Behavioral analysis, reputational data from the cloud and signature based engines, heuristics and signature databases combine with human expertise to deliver multiple layers of award-winning detection and prevention levels, with minimal false positives.

## Sandboxing

To protect against even the most sophisticated, heavily obfuscated malware, attachments are executed in a safe emulated environment where they are analyzed to ensure that dangerous samples aren't let through into the corporate system. For Kaspersky Anti Targeted Attack users, full integration supports physical detonation in an external sandbox environment - providing much deeper levels of assessment and dynamic analysis. A targeted attack can then be disrupted by blocking its components' delivery.

## Automated anti-spam (with content and source address reputation)

Kaspersky's anti-spam system uses smart engines to minimize the possibility of false positives and adapt to changes in the threat landscape, supervised by human experts. Globally collected reputation data is processed in the cloud to provide a solid basis for efficient spam detection.

## Countering business email compromise (BEC)

A dedicated machine learning-based detection system, with algorithmic models updated regularly with new scenarios, processes a number of indirect indicators, enabling the system to block even the most convincing fake emails. Support for sender authentication mechanisms such as SPF / DKIM / DMARC helps protect against source spoofing - especially helpful for withstanding Business Email Compromise (BEC) scenarios.

## Beyond the gateway - mailbox-level resilience

Mailbox-level technologies include:

**Email rescanning** - addressing scenarios like delayed phishing URL activation

**Anti-spam shadow quarantine** - ideal for low-tolerance environments. Borderline-suspicious emails can be held in temporary quarantine until sufficient evidence has been accumulated by Kaspersky Security Network for a judgement to be made on whether delivery is definitely safe.

## Advanced anti-phishing

Kaspersky's advanced anti-phishing system is based on Neural Networks analysis for effective detection models. With over 1000 criteria used - including pictures, language checks, specific scripting - this cloud-assisted approach is supported by globally acquired data about malicious and phishing URLs and IP addresses to provide protection from both known and unknown/zero-hour phishing emails.

## Preventing unsafe content transfers

Kaspersky's configurable attachment filtering system can detect file disguises commonly used by cybercriminals, to identify potentially dangerous attachments. Content filtering functionality allows the administrator to configure specialized rules for preventing data leakage.

## Built-in backup

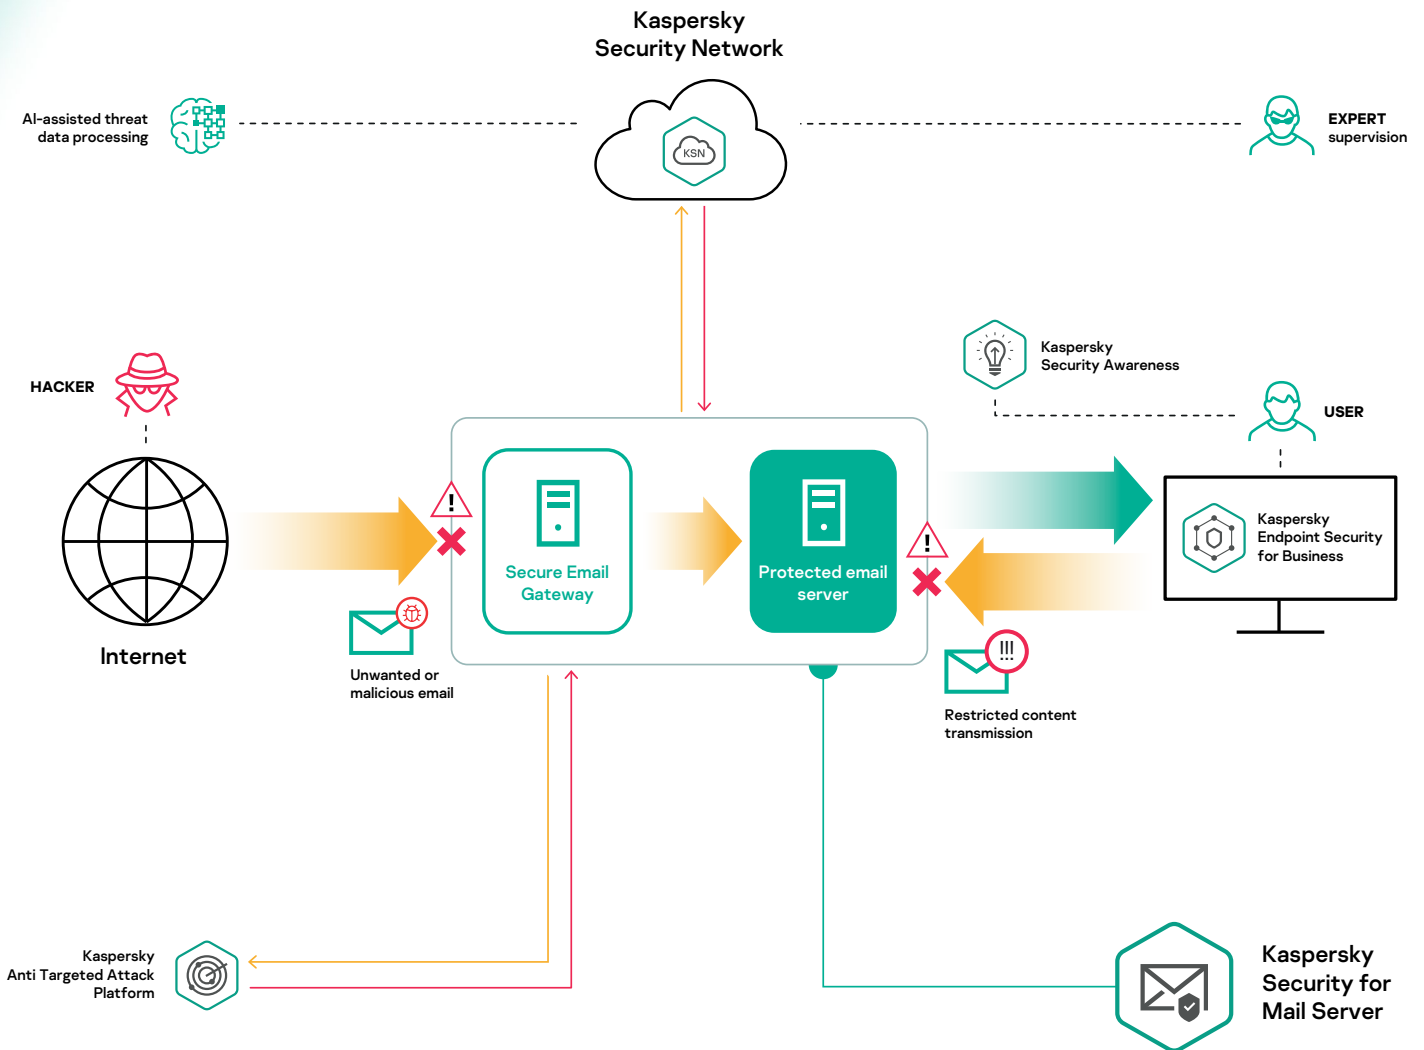

To ensure that no critical data is lost due to disinfection or deletion, original messages can be saved onto backup storage to be processed by the administrator when convenient. Specific rules can be configured for conditional data backup.

## Management and visibility

A clear user-friendly web-based interface enables the administrator to monitor your levels of corporate mail protection, with tools including:

- Flexible but easy-to-use rules and policy configuration.
- Active Directory integration.
- Event export to your SIEM system.
- Systems health diagnostic.

How Kaspersky Security for Mail Server counters email-borne cyberthreats

# Get on board with Kaspersky Security for Mail Server

Kaspersky Security for Mail Server is just one of a range of products and solutions from Kaspersky, developed in-house, drawing on 20+ years of focused expertise, built from a single code base and designed to intermesh seamlessly to provide a comprehensive and unassailable security platform.

## You may also want to consider...

**Kaspersky Security for Microsoft Office365** — specifically designed to fill the security gaps in Microsoft's cloud-based offering, including Outlook 365.

**Kaspersky Security for Internet Gateway** — complement your email perimeter protection with equally powerful web gateway security — also included in Kaspersky Total Security for Business.

**Kaspersky Endpoint Security for Business** — our flagship endpoint security solution, delivering the most tested and most awarded endpoint protection on the market.

If you already use Kaspersky Endpoint Security for Business, installing Kaspersky Security for Mail Server means you can rest assured that your mail gateway protection will deliver the same high performance standards as the rest of your security.

If you don't, now could be a good time to strengthen your perimeter and build your resilience by installing Kaspersky Security for Mail Server alongside, or instead of, your current email protection.

## How to buy

Kaspersky Security for Mail Server is sold as a standalone targeted solution or as an add-on available only to Kaspersky Endpoint Security for Business customers.

## Applications inside

- Kaspersky Security for Linux Mail Server
- Kaspersky Secure Mail Gateway
- Kaspersky Security for Microsoft Exchange Server

## Licensing

Kaspersky Security for Mail Server is available under:

- Annual license
- Monthly subscription
