

## Highlights of women's earnings in 2018

November 2019 | Report 1083

In 2018, women who were full-time wage and salary workers had median usual weekly earnings that were 81 percent of the earnings of male full-time wage and salary workers. In 1979, the first year for which comparable earnings data are available, women's earnings were 62 percent of men's. Most of the growth in women's earnings relative to men's occurred in the 1980s (when the women's-to-men's ratio went from 64 percent to 70 percent) and in the 1990s (when the ratio went from 72 percent to 77 percent). Since 2004, the women's-to-men's earnings ratio has remained in the 80 to 83 percent range. (See chart 1 and tables 1 and 12.)

This report presents earnings data from the Current Population Survey (CPS), a national monthly sample survey of about 60,000 eligible households conducted by the U.S. Census Bureau for the U.S. Bureau of Labor Statistics (BLS). The weekly and hourly earnings estimates in this report reflect calendar-year averages of information collected from one-fourth of the households in the monthly survey. The data in this report are distinct from the annual earnings estimates for full-time, year-round workers collected separately in the Annual Social and Economic Supplement (ASEC) to the CPS and published by the U.S. Census Bureau. (See the BLS website for an explanation of the differences between these datasets.)

The earnings comparisons in this report are on a broad level and do not control for many factors that can be important in explaining earnings differences, such as job skills and responsibilities, work experience, and specialization. The earnings estimates referenced throughout this report are medians. The median is the mid-point in the earnings distribution, with half of workers having earnings above the median level and half having earnings below.

See the accompanying technical notes section for more information, including a description of the source of the data and an explanation of the concepts and definitions used in this report.

## Earnings of full-time workers

Below are data highlights for women and men who usually work full time (35 hours or more per week) in wage and salary jobs, with sections focusing on characteristics such as age, race and Hispanic or Latino ethnicity, education, occupation, and more.

### Earnings by age group

In 2018, median weekly earnings were \$789 for all women age 16 and older. For men age 16 and older, median weekly earnings were \$973. Women's median weekly earnings were highest for those between the ages of 35 and 54, with no difference in the earnings of 35- to 44-year-olds and 45- to 54-year-olds (both at \$876). Women age 55 to 64 and age 65 and older had earnings that were only slightly lower (\$853 and \$811, respectively). For men, earnings were highest for 45- to 64-year-olds, with no difference in the earnings of 45- to 54- year-olds and 55- to 64-year-olds (both at \$1,137). Earnings were lowest among young women and men age 16 to 24 (\$522 and \$575, respectively) compared with other ages. (See chart 2 and table 1.)

**Chart 2. Median usual weekly earnings of women and men who are full-time wage and salary workers, by age, 2018 annual averages**

Click legend items to change data display. Hover over chart to view data.  
 Source: U.S. Bureau of Labor Statistics, Current Population Survey.

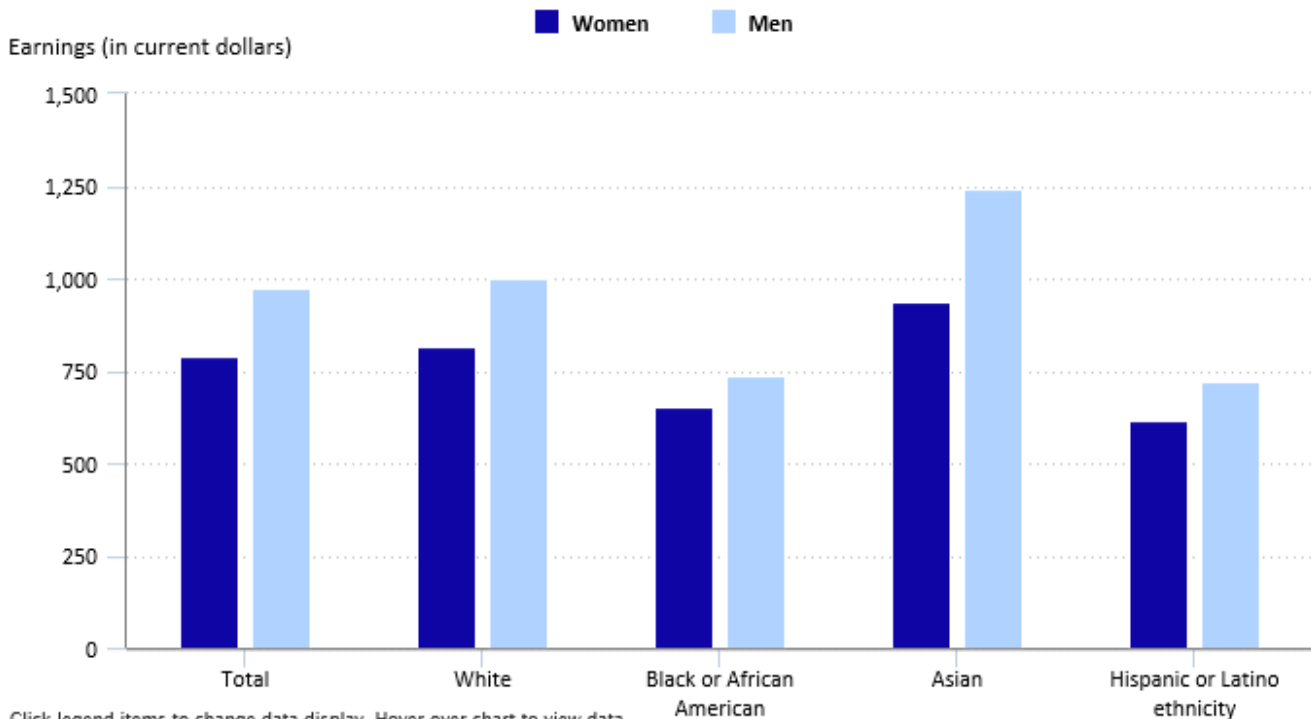

In 2018, women’s earnings ranged from 75 percent to 80 percent of men’s earnings among workers age 35 and older. For those under age 35, the earnings differences between women and men were smaller, with women earning 87 percent to 92 percent of what men did. (See table 1.)

Women’s-to-men’s earnings ratios have grown substantially for most age groups since 1979. For young workers ages 16 to 24, the gains occurred primarily in the 1980s. For workers ages 25 to 64, the gains continued into the 2000s, but have tapered off in recent years. The earnings ratio for workers age 65 and older has been relatively flat since the late 1990s. (See table 12.)

## Earnings by race and Hispanic or Latino ethnicity

Asian women and men continued to earn more than their White, Black, and Hispanic counterparts in 2018. Among women, Whites (\$817) earned 87 percent as much as Asians (\$937); Blacks (\$654) earned 70 percent; and Hispanics (\$617) earned 66 percent. Among men, these earnings differences were even larger: White men (\$1,002) earned 81 percent as much as Asian men (\$1,241); Black men (\$735) earned 59 percent as much; and Hispanic men (\$720) earned 58 percent. (See chart 3 and table 1.)

**Chart 3. Median usual weekly earnings of women and men who are full-time wage and salary workers, by race and Hispanic or Latino ethnicity, 2018 annual averages**

Click legend items to change data display. Hover over chart to view data.  
 Note: People of Hispanic or Latino ethnicity may be of any race. Estimates for the race groups shown (White, Black or African American, and Asian) include Hispanics.  
 Source: U.S. Bureau of Labor Statistics, Current Populations Survey.

Earnings differences between women and men were largest among Asians and among Whites. Asian women earned 76 percent as much as Asian men in 2018, and White women earned 82 percent as much as their male counterparts. In comparison, Black women had median earnings that were 89 percent of Black men's, and Hispanic women's earnings were 86 percent of Hispanic men's. (See table 1.)

Women's earnings have increased considerably over time, while men's earnings have not. This can be seen among the major race and Hispanic ethnicity groups, with White women experiencing the greatest earnings growth since 1979 (the first year for which comparable data for Whites, Blacks, and Hispanics are available). From 1979 to 2018, inflation-adjusted median weekly earnings (also called constant-dollar earnings) increased by 37 percent for White women, by 20 percent for Black women, and by 21 percent for Hispanic women. For White and Black women, gains tapered off around 2004. Since that time, White and Black women have seen little net change in earnings. From 2004 to 2018, the earnings of White women edged up 5 percent, while the earnings of Black women edged slightly lower (-3 percent). On the other hand, Hispanic women's earnings have remained on an upward trend, although substantial earnings growth for them did not begin until the late 1990s. (See table 18.)

The long-term trend in men's earnings has been quite different than that for women. Inflation-adjusted earnings for White and Black men trended down from 1979 through the first part of the 1990s, followed by a period of growth that stalled in the early 2000s. For Hispanic men, earnings also declined from 1979 through the mid-1990s, then began to trend up. Over the full period, 1979 through 2018, inflation-adjusted earnings have shown little change on net for White (4

percent) and Hispanic men (2 percent). Black men's inflation-adjusted earnings showed no net change from 1979 to 2018. (See table 18.)

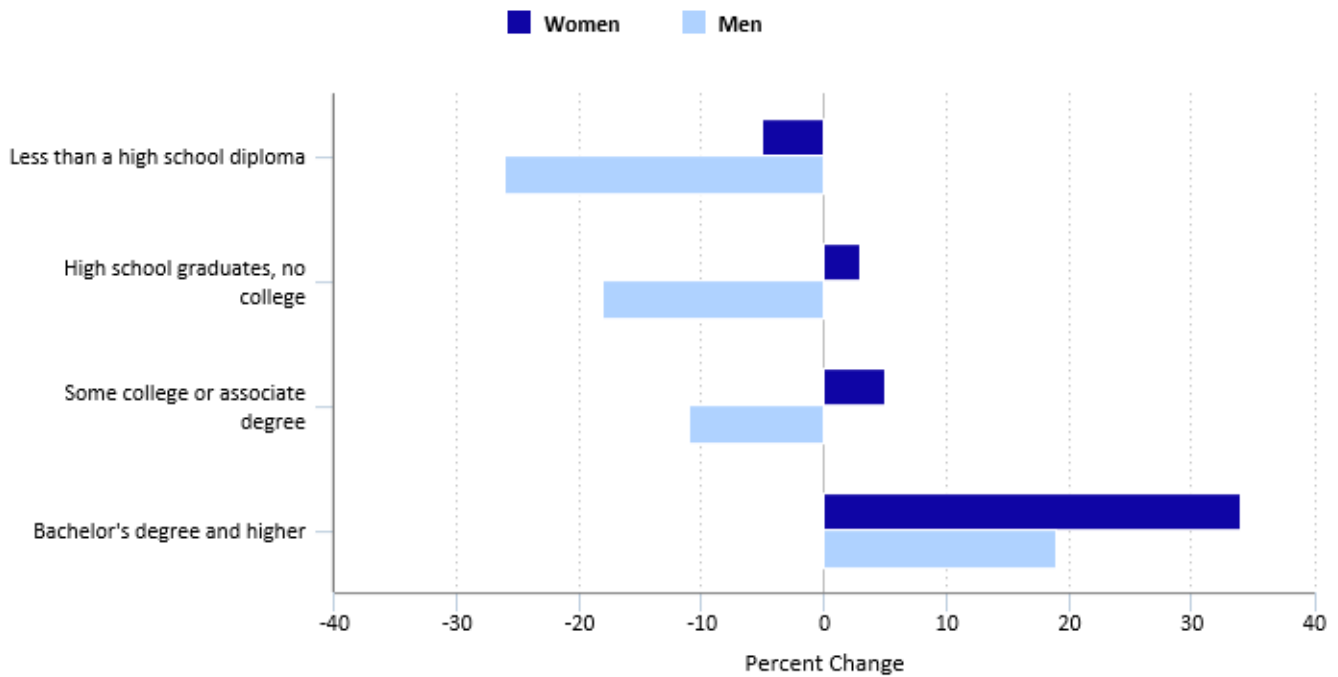

Data for Asians were not tabulated prior to 2000. Between 2000 and 2018, inflation-adjusted earnings for Asian women and men remained on an upward trend. Asian women's earnings grew by 17 percent and Asian men's earnings grew by 24 percent over the period for which data are available. (See table 18.)

## Earnings by educational attainment

Median weekly earnings vary significantly by educational attainment. Among workers age 25 and older, those without a high school diploma had median weekly earnings of \$553, representing 42 percent of the earnings of workers with a bachelor's degree or higher (\$1,324) in 2018. For workers with a high school diploma who had not attended college, median earnings (\$730) were 55 percent of those with a bachelor's degree or higher. Workers with some college or an associate degree (median weekly earnings of \$826) made 62 percent of what workers with a bachelor's degree or more made. (See table 1.)

In each educational attainment category, the long-term trend in inflation-adjusted earnings has been more favorable for women than for men. Although both women and men without a high school diploma have experienced declines in inflation-adjusted earnings since 1979, the drop for women was much smaller than that for men: a 5-percent decrease for women, compared with a 26-percent decline for men. On an inflation-adjusted basis, earnings for women with a bachelor's degree or higher have increased by 34 percent since 1979, while earnings for men with a bachelor's degree or higher have risen by 19 percent. (Data refer to workers age 25 and older.) (See chart 4 and table 19.)

**Chart 4. Percentage change in inflation-adjusted median usual weekly earnings of women and men, by educational attainment, 1979–2018**

 Note: Data relate to earnings of full-time wage and salary workers age 25 and older.  
 Source: U.S. Bureau of Labor Statistics, Current Population Survey.

## Earnings by occupation

Women and men working full time in management, business, and financial operations occupations continued to have higher median weekly earnings than workers in any other major occupational category in 2018 (\$1,168 for women and \$1,537 for men). Within this category, women who were chief executives (\$1,736) and computer and information systems managers (\$1,727) had the highest median weekly earnings in 2018. For men, those who were chief executives (\$2,488) and architectural and engineering managers (\$2,285) had the highest earnings within this major occupational category in 2018. (See table 2.)

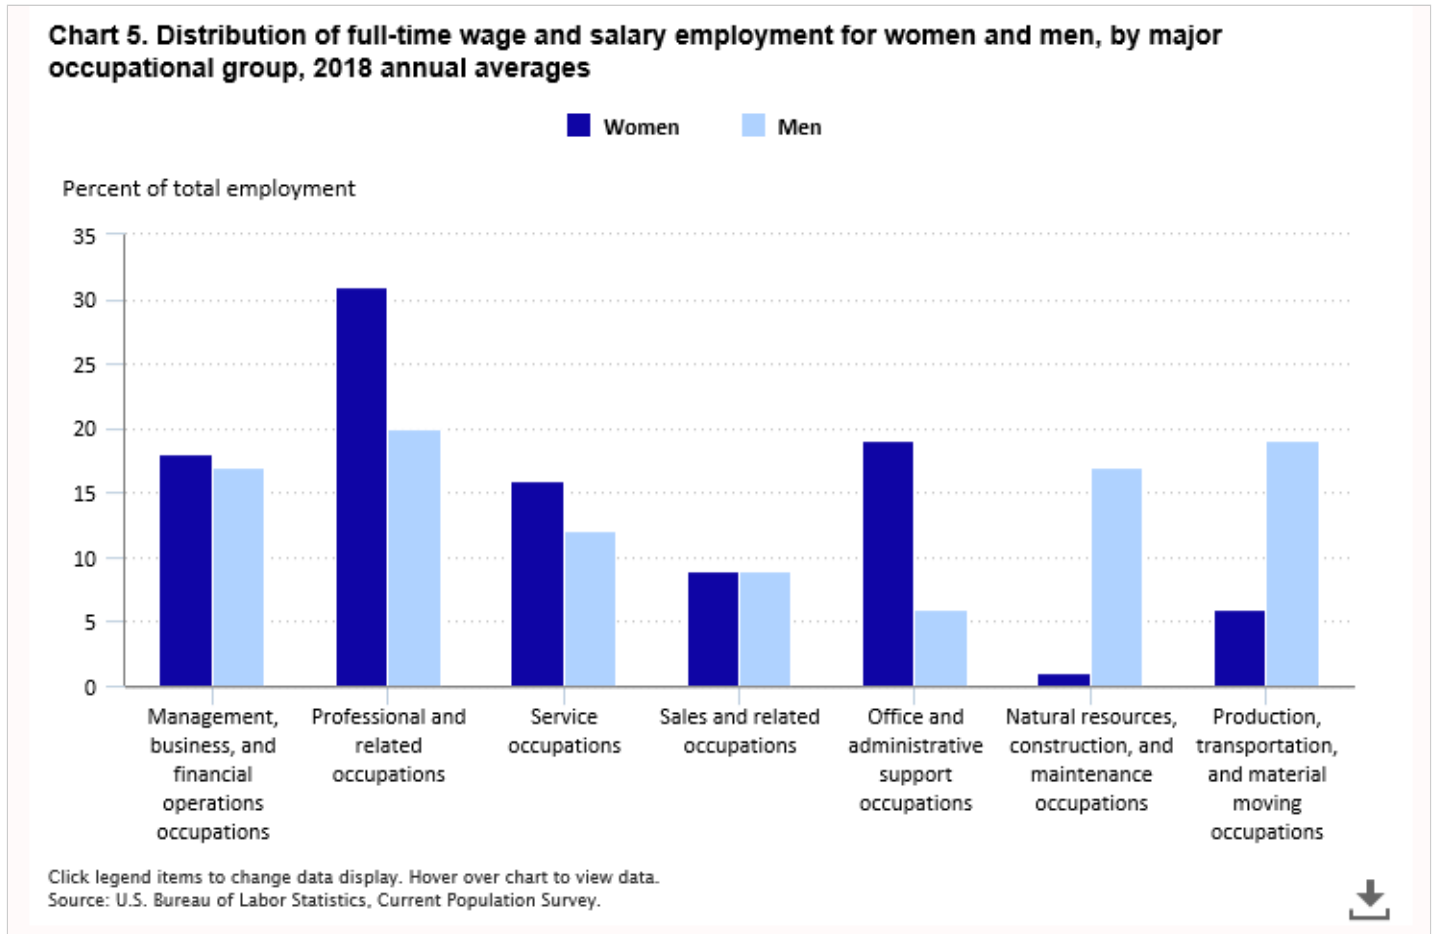

The second-highest paying occupational category for women and men was professional and related occupations (\$1,024 for women and \$1,425 for men). This is a broad occupational category made up of several distinct job groupings for specialized fields such as computer science, engineering, law, education, and healthcare. Within this diverse category, women who were nurse practitioners (\$1,891) and pharmacists (\$1,890) had the highest earnings in 2018. For men, those who were physicians and surgeons (\$2,513), pharmacists (\$2,271), and lawyers (\$2,202) earned the most. (See table 2.)

Women and men employed in service occupations continued to earn less in 2018 (\$511 for women and \$641 for men) than workers in other major occupational categories. Within service occupations, women who were employed as dining room and cafeteria attendants and bartender helpers (\$408), as cooks (\$437), and as food preparation workers (\$446) had the lowest median weekly earnings in 2018. For men, those who were employed as combined food preparation and

serving workers, including fast food (\$410) and as dishwashers (\$434) earned the least.

## Occupational distributions of women and men

The occupational distributions of female and male full-time workers differ considerably. Compared with men, relatively few women work in construction, production, or transportation occupations, and women are far more concentrated in office and administrative support occupations. (See chart 5 and table 2.)

Women also are more likely than men to work in professional and related occupations. In 2018, 31 percent of women worked in professional and related occupations, compared with 20 percent of men. Within the professional category, though, the proportion of women employed in the higher paying job groups is much smaller than the proportion of men employed in them. In 2018, 10 percent of women in professional and related occupations were employed in the two relatively high-paying computer (median weekly earnings of \$1,345 for women and \$1,604 for men) and engineering (\$1,259 for women and \$1,528 for men) occupation groups, compared with 47 percent of men. Women were more likely to work in the education (\$934 for women and \$1,235 for men) and healthcare (\$1,078 for women and \$1,383 for men) occupation groups, which generally pay less than computer and engineering jobs. Sixty-seven percent of women in professional occupations worked in education and healthcare jobs in 2018, compared with 29 percent of men. (See table 2.)

Across all occupational categories, the three most common jobs for women were elementary and middle school teacher (\$982), registered nurse (\$1,156), and secretary or administrative assistant (\$753). Each of these occupations employed roughly 2 million women in 2018, collectively representing 13 percent of women in full-time wage and salary jobs.

Among men, the most common occupation by far was truck driver (driver/sales workers and truck drivers, \$829). In 2018, 2.6 million men were truck drivers, representing 4 percent of all male full-time wage and salary workers. Although engineering occupations are shown separately by specialty (civil, mechanical, etc.) in this report, if combined, engineer would be the second most common job for men. In 2018, a total of 1.9 million men were employed full time in the 16 designated engineering specialties (median weekly earnings ranging from \$1,551 to \$1,858). (See table 2.)

## Earnings for workers with and without children under 18

In 2018, about one-third of full-time wage and salary workers were parents of children under age 18. (Children include sons, daughters, stepchildren, and adopted children under age 18 who live in the household.) Fathers of children under 18 earned more than men without children (\$1,098 and \$919, respectively). Among women, however, the difference in median weekly earnings between mothers of children under 18 (\$799) and those without children under 18 (\$784) was much smaller. (See table 7.)

## Earnings by state of residence

Median weekly earnings and women's-to-men's earnings ratios vary by state of residence. (In this report, "state" refers to the 50 states and the District of Columbia.) The differences among the states reflect, in part, variation in the occupations and industries found in each state and differences in the demographic composition of each state's labor force. Readers should note that sampling error for the state estimates is considerably larger than it is for the national estimates. (See the technical notes section for an explanation of sampling error.) Consequently, earnings comparisons between states should be made with caution. Readers also should note that the state estimates are based on workers' state of residence; their reported earnings are not necessarily from a job located in the same state. (See table 3.)

## Weekly work hours of full-time workers

Among full-time workers (that is, those usually working 35 hours or more per week), men are more likely than women to work more than 40 hours per week. In 2018, 25 percent of men who work full time usually worked 41 or more hours per week, compared with 14 percent of women. Women were more likely than men to work 35 to 39 hours per week: 10 percent of women worked such hours in 2018, while 4 percent of men did. A large majority of full-time workers had a 40-hour workweek (75 percent of women and 71 percent of men). Among those with a 40-hour workweek, women earned 86 percent as much as men. (This analysis excludes people who usually work 35 or more hours per week but whose hours vary.) (See table 5.)

## Earnings of part-time workers

Women are about twice as likely as men to work part time—that is, less than 35 hours per week on a sole or main job (including those whose hours vary). Women who worked part time made up 24 percent of all female wage and salary workers in 2018. In comparison, 12 percent of men in wage and salary jobs worked part time. (See tables 4 and 5.)

Median weekly earnings for female part-timers were \$275 in 2018, slightly higher than the \$263 median for men. (See table 4.)

Part-time workers are more likely to be under age 25 than full-time workers. Among part-timers, 29 percent of women and 42 percent of men were under age 25 in 2018. Among full-time workers, 9 percent of women and 9 percent of men were under age 25. (See tables 1 and 4.)

## **Earnings of workers paid by the hour**

In 2018, 61 percent of women and 56 percent of men in wage and salary jobs were paid by the hour. Women who were paid hourly rates had median hourly earnings of \$14.06 in 2018, which were 88 percent of the \$16.01 median for men. (See tables 8 and 11.)

Among workers who were paid hourly rates in 2018, about 3 percent of women and 2 percent of men had hourly earnings at or below the prevailing federal minimum wage of \$7.25. (See tables 10 and 11.) See the technical notes section for information about BLS estimates of the number of minimum wage workers.

## Statistical Tables

**Table 1. Median usual weekly earnings of full-time wage and salary workers, by selected characteristics, 2018 annual averages [Numbers in thousands]**

Bachelor's degree and higher	44,427	1,324	7	21,689	1,145	4	22,738	1,524	8	75.1

Footnotes  
 (1) Refers to people in opposite-sex married couples only.  
 (2) Separated includes people who are married, spouse absent.  
 (3) Differences in earnings levels between workers with and without union affiliation reflect a variety of factors in addition to coverage by a collective bargaining agreement, including the distribution of workers by occupation, industry, and geographic region.  
 (4) Data refer to members of a labor union or an employee association similar to a union.  
 (5) Data refer to both union members and workers who report no union affiliation but whose jobs are covered by a union or an employee association contract.  
 Note: Estimates for the race groups shown (White, Black or African American, and Asian) do not sum to totals because data are not presented for all race groups. People of Hispanic or Latino ethnicity may be of any race; estimates for the race groups include Hispanics.

**Table 3. Median usual weekly earnings of full-time wage and salary workers, by state, 2018 annual averages [Numbers in thousands]**

State	Total			Women			Men			Women's earnings as a percentage of men's
	Number of workers	Median weekly earnings	Standard error of median	Number of workers	Median weekly earnings	Standard error of median	Number of workers	Median weekly earnings	Standard error of median	
South Carolina	1,692	822	18	773	739	13	919	922	21	80.2
South Dakota	312	803	11	143	731	11	169	884	14	82.7
Tennessee	2,357	792	16	1,051	719	14	1,306	894	21	80.4
Texas	10,168	824	9	4,362	739	8	5,806	918	13	80.5
Utah	1,036	879	13	394	729	15	641	1,016	18	71.8
Vermont	233	901	19	105	821	25	128	954	24	86.1
Virginia	3,276	948	15	1,464	851	21	1,812	1,069	35	79.6
Washington	2,685	1,019	20	1,114	860	29	1,571	1,140	21	75.4
West Virginia	575	771	15	259	662	16	316	879	24	75.3
Wisconsin	2,101	892	14	933	795	20	1,168	985	19	80.7
Wyoming	190	880	17	77	708	16	112	1,044	35	67.8

Note: In general, the sampling error for the state estimates is considerably larger than it is for the national estimates; thus, comparisons of state estimates should be made with caution. Data shown are based on workers' state of residence; workers' reported earnings, however, may or may not be from a job located in the same state.

See footnotes at end of table.

Footnotes  
 (1) Refers to people in opposite-sex married couples only.  
 (2) Separated includes people who are married, spouse absent.  
 (3) Differences in earnings levels between workers with and without union affiliation reflect a variety of factors in addition to coverage by a collective bargaining agreement, including the distribution of workers by occupation, industry, and geographic region.  
 (4) Data refer to members of a labor union or an employee association similar to a union.  
 (5) Data refer to both union members and workers who report no union affiliation but whose jobs are covered by a union or an employee association contract.  
 Note: Estimates for the race groups shown (White, Black or African American, and Asian) do not sum to totals because data are not presented for all race groups. People of Hispanic or Latino ethnicity may be of any race; estimates for the race groups include Hispanics.

Footnotes  
 (1) The distinction between full- and part-time workers is based on hours usually worked. These data do not sum to totals because full- or part-time status on the principal job is not identifiable for a small number of multiple jobholders.  
 Note: See the technical notes section for information about the federal minimum wage level and estimating the number of minimum wage workers. Estimates for the race groups shown (White, Black or African American, and Asian) do not sum to totals because data are not presented for all race groups. People of Hispanic or Latino ethnicity may be of any race; estimates for the race groups include Hispanics.

Footnotes

(1) Data for 1990-91, 1996-97, and 2007-09 reflect changes in the minimum wage that took place in those years.

Note: The comparability of historical labor force data has been affected at various times by methodological and other changes in the Current Population Survey (CPS). Information about historical comparability is online at <https://www.bls.gov/cps/documentation.htm#comp>. See the technical notes section for information about the federal minimum wage level and estimating the number of minimum wage workers.

Information about historical comparability is online at <https://www.bls.gov/cps/documentation.htm#comp>. The women's-to-men's earnings ratios shown here are calculated from the current-dollar median usual weekly earnings of full-time wage and salary workers in table 23. As of 2003, estimates for the race groups shown (White, Black or African American, and Asian) include people who selected that race group only; people who selected more than one race group are not included. Prior to 2003, people who reported more than one race were included in the group they identified as the main race. Asian data for 2000-2002 are for Asians and Pacific Islanders. As of 2003, Asians constitute a separate category. Data for Asians were not tabulated prior to 2000. People of Hispanic or Latino ethnicity may be of any race; estimates for the race groups include Hispanics. Dash indicates data not available.

Note: The comparability of historical labor force data has been affected at various times by methodological and other changes in the Current Population Survey (CPS). Information about historical comparability is online at <https://www.bls.gov/cps/documentation.htm#comp>. The Consumer Price Index research series using current methods (CPI-U-RS) is used to convert current dollars to constant (inflation-adjusted) dollars. See the technical notes section.

Note: The comparability of historical labor force data has been affected at various times by methodological and other changes in the Current Population Survey (CPS). Information about historical comparability is online at <https://www.bls.gov/cps/documentation.htm#comp>. As of 2003, estimates for the race groups shown (White, Black or African American, and Asian) include people who selected that race group only; people who selected more than one race group are not included. Prior to 2003, people who reported more than one race were included in the group they identified as the main race. Asian data for 2000-2002 are for Asians and Pacific Islanders. As of 2003, Asians constitute a separate category. Data for Asians were not tabulated prior to 2000. People of Hispanic or Latino ethnicity may be of any race; estimates for the race groups include Hispanics. The Consumer Price Index research series using current methods (CPI-U-RS) is used to convert current dollars to constant (inflation-adjusted) dollars. See the technical notes section. Dash indicates data not available.

See footnotes at end of table.

Note: The comparability of historical labor force data has been affected at various times by methodological and other changes in the Current Population Survey (CPS). Information about historical comparability is online at <https://www.bls.gov/cps/documentation.htm#comp>. The Consumer Price Index research series using current methods (CPI-U-RS) is used to convert current dollars to constant (inflation-adjusted) dollars. See the technical notes section.

Note: The comparability of historical labor force data has been affected at various times by methodological and other changes in the Current Population Survey (CPS). Information about historical comparability is online at <https://www.bls.gov/cps/documentation.htm#comp>. As of 2003, estimates for the race groups shown (White, Black or African American, and Asian) include people who selected that race group only; people who selected more than one race group are not included. Prior to 2003, people who reported more than one race were included in the group they identified as the main race. Asian data for 2000-2002 are for Asians and Pacific Islanders. As of 2003, Asians constitute a separate category. Data for Asians were not tabulated prior to 2000. People of Hispanic or Latino ethnicity may be of any race; estimates for the race groups include Hispanics. The Consumer Price Index research series using current methods (CPI-U-RS) is used to convert current dollars to constant (inflation-adjusted) dollars. See the technical notes section. Dash indicates data not available.

Note: The comparability of historical labor force data has been affected at various times by methodological and other changes in the Current Population Survey (CPS). Information about historical comparability is online at <https://www.bls.gov/cps/documentation.htm#comp>. As of 2003, estimates for the race groups shown (White, Black or African American, and Asian) include people who selected that race group only; people who selected more than one race group are not included. Prior to 2003, people who reported more than one race were included in the group they identified as the main race. Asian data for 2000-2002 are for Asians and Pacific Islanders. As of 2003, Asians constitute a separate category. Data for Asians were not tabulated prior to 2000. People of Hispanic or Latino ethnicity may be of any race; estimates for the race groups include Hispanics. Dash indicates data not available. Source: U.S. Bureau of Labor Statistics.

Note: The comparability of historical labor force data has been affected at various times by methodological and other changes in the Current Population Survey (CPS). Information about historical comparability is online at <https://www.bls.gov/cps/documentation.htm#comp>. As of 2003, estimates for the race groups shown (White, Black or African American, and Asian) include people who selected that race group only; people who selected more than one race group are not included. Prior to 2003, people who reported more than one race were included in the group they identified as the main race. Asian data for 2000-2002 are for Asians and Pacific Islanders. As of 2003, Asians constitute a separate category. Data for Asians were not tabulated prior to 2000. People of Hispanic or Latino ethnicity may be of any race; estimates for the race groups include Hispanics. Dash indicates data not available.  
 Source: U.S. Bureau of Labor Statistics.

## Technical Notes

The estimates in this report were obtained from the Current Population Survey (CPS), which provides information on the labor force, employment, and unemployment. The survey is conducted monthly for the U.S. Bureau of Labor Statistics (BLS) by the U.S. Census Bureau using a scientifically selected national sample of about 60,000 eligible households representing all 50 states and the District of Columbia. The survey data on earnings are based on one-fourth of the CPS monthly sample and are limited to wage and salary workers. All self-employed workers, both incorporated and unincorporated, are excluded from the data presented in this report.

The earnings comparisons in this report are on a broad level and do not control for many factors that can help explain earnings differences. This includes the direct comparisons of earnings levels among demographic groups and the women's-to-men's earnings ratios shown in the tables (that is, women's earnings as a percentage of men's). For example, the overall ratio of women's-to-men's earnings for full-time workers presented here is not controlled for differences in important determinants of earnings such as age, occupation, and educational attainment. The earnings comparisons in this report are not restricted to workers with otherwise comparable characteristics and comparable jobs. Even controlling for one of the factors may not fully explain earnings differences. Comparisons of women's and men's earnings by detailed occupation, for example, are not simultaneously controlled for differences in key factors such as age, job skills and responsibilities, work experience, and specialization.

Material in this report is in the public domain and may be used without permission. Information in this report will be made available upon request to individuals with sensory impairments. Voice telephone: (202) 691-5200; Federal Relay Service: 1 (800) 877-8339.

## Concepts and definitions

The principal concepts and definitions used in this report are described briefly below.

*Wage and salary workers* are people age 16 and older who receive wages, salaries, commissions, tips, payments in kind, or piece rates on their sole or principal job. This group includes employees in both the public and private sectors. All self-employed workers are excluded whether or not their businesses are incorporated.

*Full-time workers* are defined for the purpose of these estimates as those who usually work 35 hours or more per week at their sole or principal job. The federal Fair Labor Standards Act (FLSA) does not define full- or part-time employment.

*Part-time workers* are defined for the purpose of these estimates as those who usually work fewer than 35 hours per week at their sole or principal job. The federal Fair Labor Standards Act (FLSA) does not define full- or part-time employment.

*Usual weekly earnings* reflect earnings before taxes and other deductions and include any overtime pay, commissions, or tips usually received (at the main job in the case of multiple jobholders). Before 1994, respondents were asked how much they usually earned per week. Since January 1994, respondents have been asked to identify the easiest way for them to report earnings (hourly, weekly, biweekly, twice monthly, monthly, annually, or other) and how much they usually earn in the reported time period. Earnings reported on a basis other than weekly are converted to a weekly equivalent. The term "usual" is determined by each respondent's own understanding of the term. If the respondent asks for a definition of "usual," interviewers are instructed to define the term as more than half the weeks worked during the past 4 or 5 months.

*The median of usual weekly earnings* reflects the midpoint in a given earnings distribution, with half of workers having earnings above the median and the other half having earnings below the median.

The BLS procedure for estimating the median of a weekly earnings distribution places each reported or calculated weekly earnings value into a \$50-wide interval that is centered around a multiple of \$50. The median is calculated through the linear interpolation of the interval in which the median lies.

Changes over time in the medians for specific groups may not necessarily be consistent with the movements estimated for the overall median boundary. The most common reasons for this possible anomaly are as follows:

- There could be a change in the relative weights of the subgroups. For example, the median earnings of 16- to 24-year olds and the median earnings of those 25 years and older may rise, but if the lower earning 16- to 24-age group accounts for a greatly increased share of the total, the overall median could actually fall.
- There could be a large change in the shape of the distribution of reported earnings, particularly near a median boundary. This change could be caused by survey observations that are clustered at rounded values, such as \$700 or \$800. An estimate lying in a \$50-wide centered interval containing such a cluster tends to change more slowly than one in other intervals. Consider, for example, the calculation of the median for a multi-peaked earnings distribution that shifts over time. As such a distribution shifts, the median does not necessarily move at the same rate. Specifically, the median takes relatively more time to move through a frequently reported earnings interval, but once above the upper limit of such an interval, it can move relatively quickly to the next frequently reported interval. BLS procedures for estimating medians mitigate such irregular movements; however, users should be cautious of these effects when evaluating short-term changes in the medians and in ratios of the medians.

Workers paid by the hour are employed wage and salary workers who report that they are paid at an hourly rate on their job. Typically, workers paid an hourly wage have made up around 60 percent of all wage and salary workers. Estimates of workers paid by the hour include both full- and part-time workers unless otherwise specified.

*Hourly earnings* data are for wage and salary workers who are paid by the hour and pertain to earnings from a person's sole or principal job. Hourly earnings for hourly paid workers do not include overtime pay, commissions, or tips received.

*Workers paid at or below the federal minimum wage* include only workers who are paid hourly rates. Salaried workers and other nonhourly paid workers are excluded, even though some have earnings that, if converted to hourly rates, would be at or below the federal minimum wage.

The estimates of workers paid at or below the federal minimum wage in this report are based solely on whether the hourly wage they report (which does not include overtime pay, tips, or commissions) is at or below the federal minimum wage. Some respondents might round hourly earnings when answering survey questions. As a result, some workers might report having hourly earnings above or below the federal minimum wage when in fact they earn the minimum wage.

Some workers who reported earnings below the prevailing federal minimum wage may not be covered by federal or state minimum wage laws because of exclusions and exemptions in the statutes. Thus, the presence of workers with hourly earnings below the federal minimum wage does not necessarily indicate violations of the federal Fair Labor Standards Act (FLSA) or state statutes in cases where such standards apply. The CPS does not include questions on

whether workers are covered by the minimum wage provisions of the FLSA or by individual state or local minimum wage laws.

The estimates presented in this report likely understate the actual number of workers with hourly earnings at or below the minimum wage. BLS does not routinely estimate the hourly earnings of workers not paid by the hour because there are data quality concerns associated with constructing such an estimate.

Regular collection of earnings data in the basic CPS began in 1979. The prevailing federal minimum wage from 1979 to the present is as follows, with the last change occurring in 2009.

<b>Federal minimum wage</b>	<b>Effective date</b>
\$2.90	January 1, 1979
\$3.10	January 1, 1980
\$3.35	January 1, 1981
\$3.80	April 1, 1990
\$4.25	April 1, 1991
\$4.75	October 1, 1996
\$5.15	September 1, 1997
\$5.85	July 24, 2007
\$6.55	July 24, 2008
\$7.25	July 24, 2009

When the minimum wage has increased during a given year, the annual average estimates of the number of minimum wage workers reflect both minimum wage levels in effect during the year. For example, data for 2007 reflect the number

of workers who earned the federal minimum wage of \$5.15 for January to July and the number of workers who earned the minimum wage of \$5.85 for August to December.

*Race* is reported by the household respondent. In accordance with the Office of Management and Budget standards, White, Black or African American, and Asian are terms used to describe a person's race. Beginning in 2003, people in these categories are those who selected that race group only. Those who identify multiple race groups are categorized as people of Two or More Races. Before 2003, people of Two or More Races identified one group as their main race. For more information on the 2003 changes to questions on race, see "Revisions to the Current Population Survey Effective in January 2003." Data for other race groups—American Indians and Alaska Natives, Native Hawaiians and Other Pacific Islanders—and for people of Two or More Races are included in totals but not separately identified in this report because the number of survey respondents is too small to develop estimates of acceptable reliability.

*Hispanic or Latino ethnicity* refers to people who identified themselves in the survey process as being of Hispanic, Latino, or Spanish origin. People who identify themselves as Hispanic or Latino ethnicity may be of any race and are included in estimates for the race groups (White, Black or African American, and Asian) in addition to being shown separately.

*Married, spouse present* refers to people in opposite-sex marriages living together in the same household, even though one may be temporarily absent on business, on vacation, on a visit, in a hospital, or for other reasons.

*Other marital status* refers to people who are never married; widowed; divorced; separated; married, spouse absent; as well as people in same-sex marriages. Separated includes people with legal separations, those living apart with intentions of obtaining a divorce, and other people permanently or temporarily separated because of marital discord. Married, spouse absent, includes opposite-sex married people living apart because either the husband or wife was employed and living at a considerable distance from home, was serving away from home in the Armed Forces, had moved to another area, or had a different place of residence for any other reason except those listed in the separated definition above.

*Inflation-adjusted earnings* shown in this report use the Consumer Price Index research series using current methods (CPI-U-RS) to convert current dollars to constant, or inflation-adjusted, dollars. BLS has made numerous improvements to the Consumer Price Index (CPI) over the years. Although these improvements make the CPI more accurate, the histories of official CPI series are not adjusted to reflect the improvements. Because many researchers need a historical series that measures price change consistently over time, BLS developed the CPI-U-RS to provide an estimate of the CPI that incorporates most of the methodological improvements made since 1978 into the entire series. For further information, see the CPI research series webpage.

This report uses the most recent version of the CPI-U-RS available at the time of production. Users should note that the CPI-U-RS is subject to periodic revision. As a result, the rate of inflation incorporated into the inflation-adjusted median earnings estimates in this report may differ from the rate used in previous reports in this series or in other publications.

## Reliability

Statistics based on the CPS are subject to both sampling and nonsampling error. When a sample, rather than the entire population, is surveyed, there is a chance that the sample estimates may differ from the true population values they represent. The component of this difference that occurs because samples differ by chance is known as sampling error, and its variability is measured by the standard error of the estimate. There is about a 90-percent chance, or level of

confidence, that an estimate based on a sample will differ by no more than 1.645 standard errors from the true population value because of sampling error. BLS analyses are generally conducted at the 90-percent level of confidence.

Readers should be aware that because of sampling error, apparent differences between estimates for two or more groups or categories may not be statistically significant, and therefore not meaningfully different from one another. Standard errors are shown with many of the median earnings estimates in this report to help readers evaluate differences in earnings estimates.

The CPS data also are affected by nonsampling error. Nonsampling error can occur for many reasons, including the failure to sample a segment of the population, inability to obtain information on all respondents in the sample, inability or unwillingness of respondents to provide correct information, and errors made in the collection or processing of the data. Further information about the reliability of data from the CPS is available on the CPS Technical Documentation page of the BLS website.
