

INTELLIGENCE-LED TESTING

Enterprise Advanced Security

Enterprise

EDR
DETECTION

July 2022

SE Labs tested a variety of Endpoint Detection and Response products against a range of hacking attacks designed to compromise systems and penetrate target networks in the same way as criminals and other attackers breach systems and networks.

Full chains of attack were used, meaning that testers behaved as real attackers, probing targets using a variety of tools, techniques and vectors before attempting to gain lower-level and more powerful access. Finally, the testers/ attackers attempted to complete their missions, which might include stealing information, damaging systems and connecting to other systems on the network.

INTRODUCTION

Endpoint Detection Compared

We compare endpoint security products directly using real, major threats

Welcome to the first edition of the Enterprise Advanced Security test that compares different endpoint security products directly. We look at how they handle the major threats that face all businesses, from the Global 100 and down to medium enterprises. Most likely small businesses, too. We give an overall score but also dig down into the details that your security team will care about. This report explains the different levels of coverage that these products provide.

An Endpoint Detection and Response (EDR) product is more than anti-virus, which is why it requires advanced testing. This means testers must behave like real attackers, following every step of an attack.

While it's tempting to save time by taking shortcuts, a tester must go through an entire attack to truly understand the capabilities of EDR security products.

Each step of the attack must be realistic too. You can't just make up what you think bad guys are doing and hope you're right. This is why SE Labs tracks cybercriminal behaviour and builds tests based on how bad guys try to compromise victims.

The cybersecurity industry is familiar with the concept of the 'attack chain', which is the combination of those attack steps.

Fortunately the MITRE organisation has documented each step with its ATT&CK framework. While this doesn't give an exact blueprint for realistic attacks, it does present a general structure that testers, security vendors and customers (you!) can use to run tests and understand test results.

The Enterprise Advanced Security tests that SE Labs runs are based on real attackers' behaviour. This means we can present how we run those attacks using a MITRE ATT&CK-style format.

You can see how ATT&CK lists out the details of each attack, and how we represent the way we tested, in **Appendix A: Threat Intelligence**, starting on page 15. This brings two main advantages: you can have confidence that the way we test is realistic and relevant; and you're probably already familiar with this way of illustrating cyber attacks.

If you spot a detail in this report that you don't understand, or would like to discuss, please contact us via our [Twitter](#) account. SE Labs uses current threat intelligence to make our tests as realistic as possible. To learn more about how we test, how we define 'threat intelligence' and how we use it to improve our tests please visit our [website](#) and follow us on [Twitter](#).

Executive Summary

SE Labs ran real, significant attacks against market leading EDR products to assess their abilities to detect threats. These attacks were designed to compromise systems and penetrate target networks in the same way that criminals and other attackers breach systems and networks.

Testers used legitimate files alongside the threats to measure any false positive detections or other sub-optimal interactions.

We examined each product's abilities to:

- Detect the delivery of targeted attacks
- Track different elements of the attack chain...
- ...including compromises beyond the endpoint, to the wider network

All products were able to detect some part of each targeted attack. They were also capable of tracking most of the subsequent malicious activities that occurred during the attacks.

The majority of products handled legitimate files perfectly. **BlackBerry's** product found this part of the test particularly challenging. The **Anonymous Endpoint Security** product put in a strong performance but generally failed to detect the earliest stage of each attack. Products from **Broadcom, Kaspersky and CrowdStrike** gave comprehensively strong performances to achieve AAA awards.

Executive Summary				
Products Tested	Attacks Detected (%)	Detection Accuracy (%)	Legitimate Accuracy Rating (%)	Total Accuracy Rating (%)
Kaspersky Endpoint Security	100%	100%	100%	100%
Broadcom Symantec Endpoint Security and Cloud Workload Protection	100%	100%	100%	100%
CrowdStrike Falcon	100%	97%	100%	98%
Anonymous Endpoint Security	100%	94%	97%	95%
BlackBerry CylancePROTECT + OPTICS	100%	97%	61%	79%

Products highlighted in green were the most accurate, scoring 85 per cent or more for Total Accuracy. Those in yellow scored less than 85 but 75 or more. Products shown in red scored less than 75 per cent.

For exact percentages, see **2. Total Accuracy Ratings** on page 11.

Endpoint Detection and Response Awards

The following products win SE Labs awards:

- **Kaspersky** Endpoint Security
- **Broadcom** Symantec Endpoint Security and Cloud Workload Protection
- **CrowdStrike** Falcon
- **Anonymous** Endpoint Security

- **BlackBerry** CylancePROTECT + OPTICS

1. How we Tested

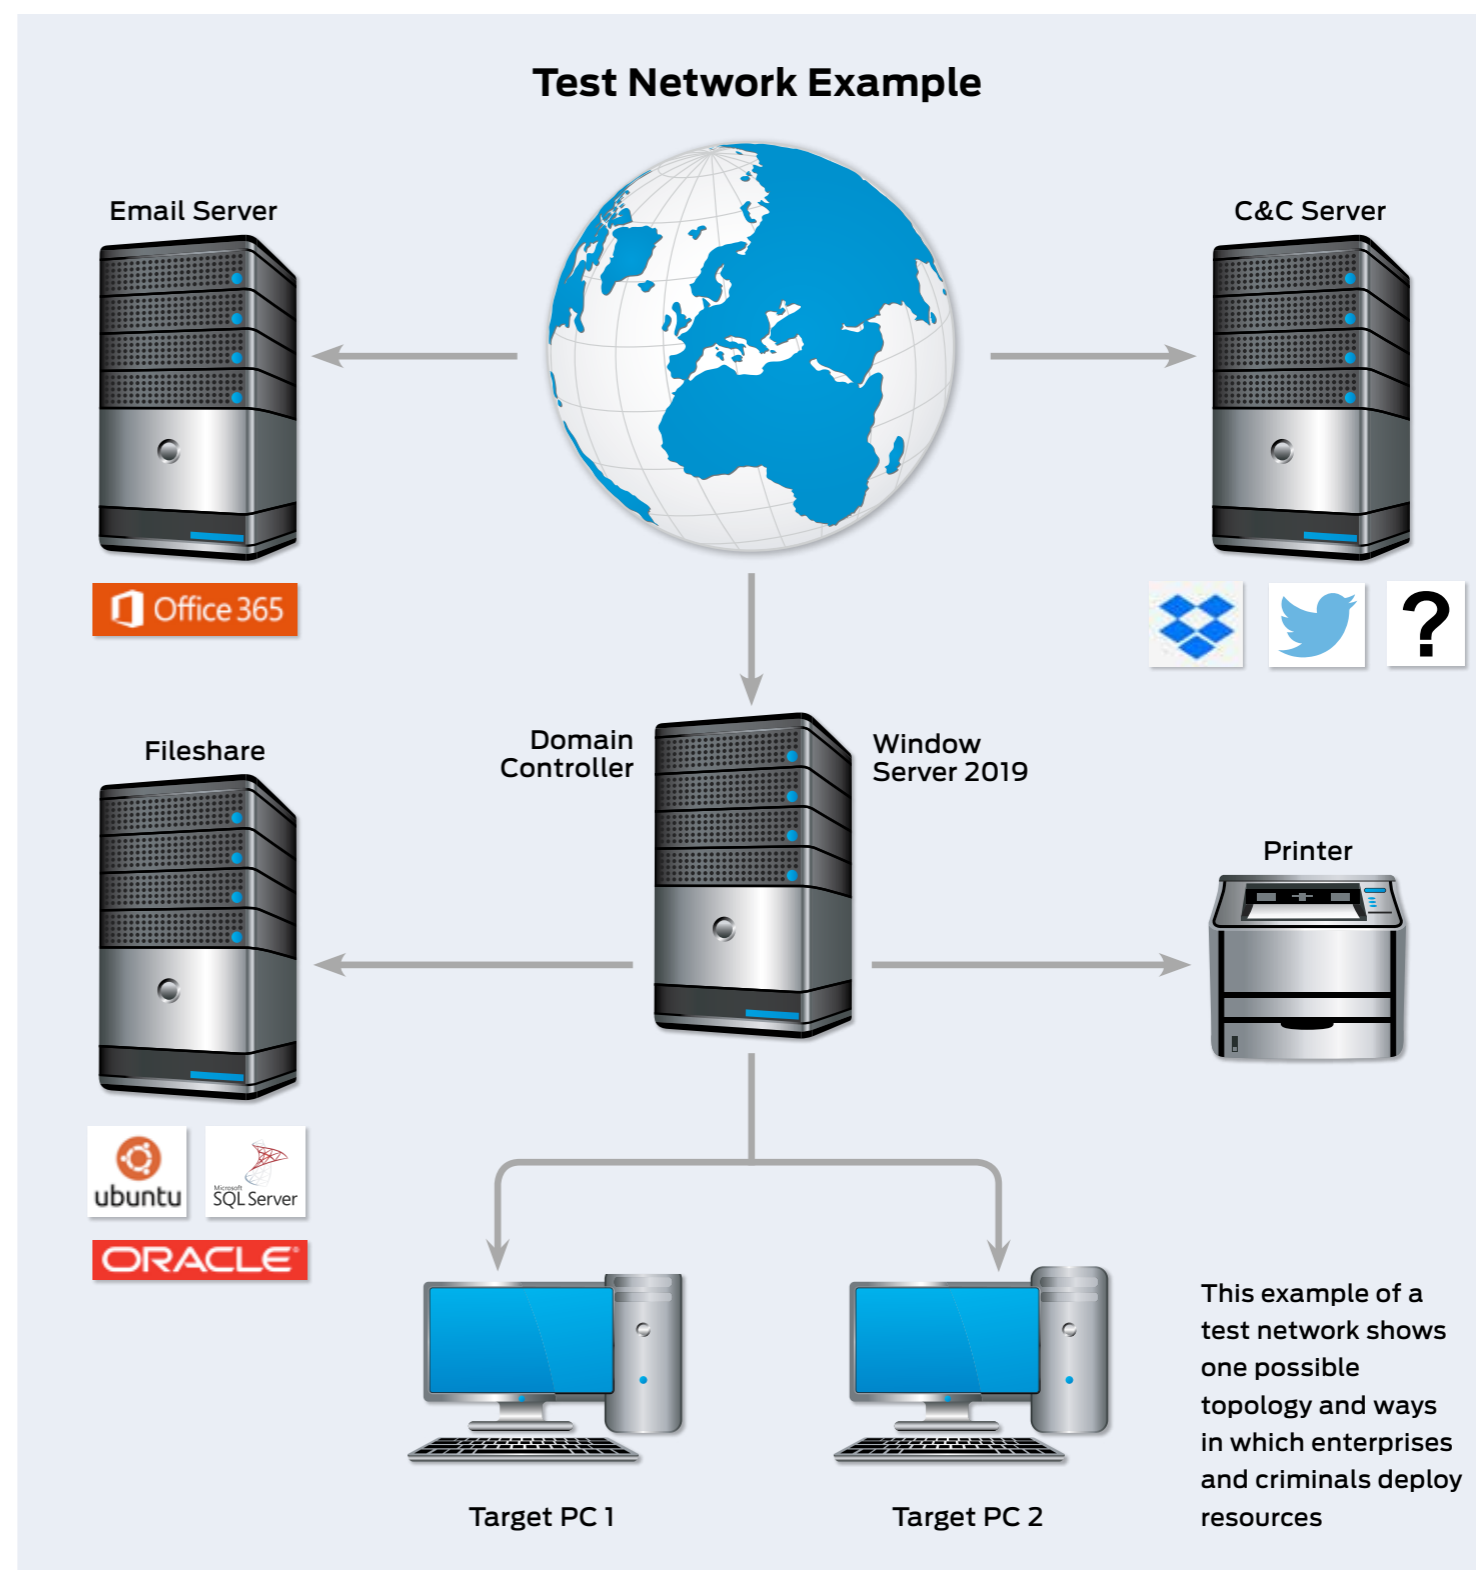

Testers can't assume that products will work a certain way, so running a realistic advanced security test means setting up real networks and hacking them in the same way that real adversaries behave.

In the diagram on the right you will see an example network that contains workstations, some basic infrastructure such as file servers and a domain controller, as well as cloud-based email and a malicious command and control (C&C) server, which may be a conventional computer or a service such as Dropbox, Twitter, Slack or something else more imaginative.

As you will see in the **Threat Responses** section on page 8, attackers often jump from one compromised system to another in so-called 'lateral movement'. To allow products to detect this type of behaviour the network needs to be built realistically, with systems available, vulnerable and worth compromising.

It is possible to compromise devices such as enterprise printers and other so-called 'IoT' (internet of things) machines, which is why we've included a representative printer in the diagram.

The techniques that we choose for each test case are largely dictated by the real-world behaviour of online criminals. We observe their tactics and replicate what they do in this test. To see more details about how the specific attackers behaved, and how we copied them, see **Hackers vs. Targets** on page 10 and, for a really detailed drill down on the details, **Appendix A: Threat Intelligence** on pages 15 to 18 and **Appendix F: Attack Details**.

Threat Responses

Full Attack Chain: Testing every layer of detection and protection

Attackers start from a certain point and don't stop until they have either achieved their goal or have reached the end of their resources (which could be a deadline or the limit of their abilities). This means, in a test, the tester needs to begin the attack from a realistic first position, such as sending a phishing email or setting up an infected website, and moving through many of the likely steps leading to actually stealing data or causing some other form of damage to the network.

If the test starts too far into the attack chain, such as executing malware on an endpoint, then many products will be denied opportunities to use the full extent of their protection and detection

abilities. If the test concludes before any 'useful' damage or theft has been achieved, then similarly the product may be denied a chance to demonstrate its abilities in behavioural detection and so on.

Attack stages

The illustration (below) shows some typical stages of an attack. In a test each of these should be attempted to determine the security solution's effectiveness. This test's results record detection and protection for each of these stages.

We measure how a product responds to the first stages of the attack with a detection and/or protection rating. Sometimes products allow threats to run but detect them. Other times they

might allow the threat to run briefly before neutralising it. Ideally they detect and block the threat before it has a chance to run. Products may delete threats or automatically contain them in a 'quarantine' or other safe holding mechanism for later analysis.

Should the initial attack phase succeed we then measure post-exploitation stages, which are represented by steps two through to seven below. We broadly categorise these stages as: Access (step 2); Action (step 3); Escalation (step 4); and Post-escalation (steps 5-7).

In figure 1, you can see a typical attack running from start to end, through various 'hacking' activities. This can be classified as a fully successful breach.

Attack Chain Stages

Figure 1. A typical attack starts with an initial contact and progresses through various stages, including reconnaissance, stealing data and causing damage.

In figure 2, a product or service has interfered with the attack, allowing it to succeed only as far as stage 3, after which it was detected and neutralised. The attacker was unable to progress through stages 4 and onwards.

It is possible for an attack to run in a different order with, for example, the attacker attempting to connect to other systems without needing to escalate privileges. However, it is common for password theft (see step 5) to occur before using stolen credentials to move further through the network.

It is also possible that attackers will not cause noticeable damage during an attack. It may be that their goal is persistent presence on the systems to monitor for activities, slowly steal information and other more subtle missions.

In figure 3, the attacker has managed to progress as far as stage five. This means that the system has been seriously compromised. The attacker has a high level of access and has stolen passwords. However, attempts to exfiltrate data from the target were blocked, as were attempts to damage the system.

Attack Chain: How Hackers Progress

Figure 2. This attack was initially successful but only able to progress as far as the reconnaissance phase

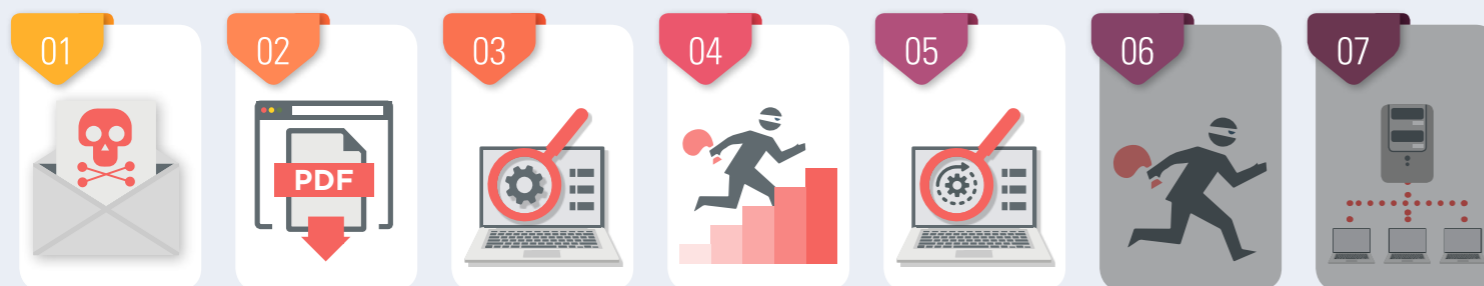

Figure 3. A more successful attack manages to steal passwords but wholesale data theft and destruction was blocked

Hackers vs. Targets

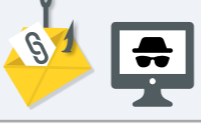

When testing services against targeted attacks it is important to ensure that the attacks used are relevant. Anyone can run an attack randomly against someone else. It is the security vendor's challenge to identify common attack types and to protect against them. As testers, we need to generate threats that in some way relate to the real world.

All of the attacks used in this test are valid ways to compromise an organisation. Without any security in place, all would succeed in attacking the target. Outcomes would include systems infected with ransomware, remote access to networks and data theft.

But we didn't just sit down and brainstorm how we would attack different companies. Instead we used current threat intelligence to look at what the bad guys have been doing over the last few years and copied them quite closely. This way we can test the services' abilities to handle similar threats to those faced by global governments, financial institutions and national infrastructure.

The graphic on this page shows a summary of the attack groups that inspired the targeted attacks used in this test. If a service was able to detect and protect against these then there's a good chance they are on track to blocking similar attacks in the real world. If they fail, then you might take their bold marketing claims about defeating hackers with a pinch of salt.

For more details about each APT group please see **Appendix A: Threat Intelligence** on pages 15 to 18.

Hackers vs. Targets			
Attacker/APT Group	Method	Target	Details
Wizard Spider			Credential harvesting, cryptomining and implementation of ransomware.
Sandworm			Obtain sensitive network data via encryption and system data wiping.
Lazarus Group			Phishing and exploitation of public facing servers; data wiping.
Operation Wocao			Exploitation of vulnerable servers with a focus on data exfiltration.

Key			
 Aviation	 Banking and ATMs	 Energy	 Entertainment
 Financial	 Gambling	 Government Espionage	 Healthcare
 Law	 Natural Resources	 US Retail, Restaurant and Hospitality	

2. Total Accuracy Ratings

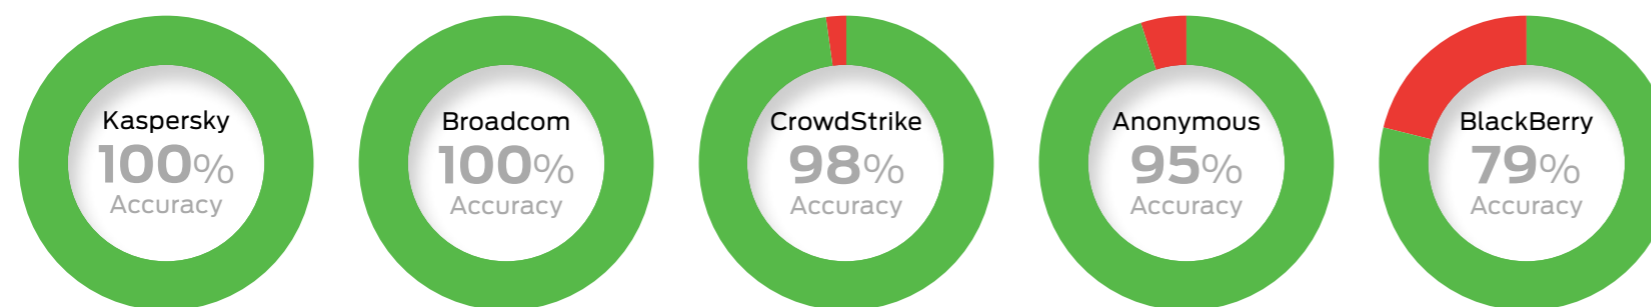

This test examines the total insight a product has, or can provide, into a specific set of attacking actions. We've divided the attack chain into chunks of one or more related actions. To provide sufficient insight, a product must detect at least one action in each chunk.

If you look at the results tables in **Appendix B: Detailed Response** on page 19 you'll see that Delivery and Execution are grouped together into one chunk, while Action sits alone. Escalation and

Post-Escalation (PE) Action are grouped, while Lateral Movement and Lateral Action are also grouped.

This means that if the product detects either the threat being delivered or executed, it has coverage for that part of the attack. If it detects the action as well as the escalation of privileges and an action involved in lateral movement then it has what we consider to be complete insight, even if it doesn't detect some parts of some chunks (i.e. Lateral Movement, in this example).

Total Accuracy Ratings			
Product	Total Accuracy Rating	Total Accuracy (%)	Award
Kaspersky Endpoint Security	1,328	100%	AAA
Broadcom Symantec Endpoint Security and Cloud Workload Protection	1,328	100%	AAA
CrowdStrike Falcon	1,308	98%	AAA
Anonymous Endpoint Security	1,268	95%	AAA
BlackBerry CylancePROTECT + OPTICS	1,054	79%	A

Total Accuracy Ratings combine protection and false positives.

SE Labs helps advance the effectiveness of computer security through innovative, detailed and intelligence-led testing, run with integrity.

3. Response Details

In this test security products are exposed to attacks, which comprise multiple stages. The perfect product will detect all relevant elements of an attack. The term 'relevant' is important, because sometimes detecting one part of an attack means it's not necessary to detect another.

For example, in the results tables in **Appendix B: Detailed Response** certain stages of the attack chain have been grouped together. These groups are as follows:

Delivery/ Execution (+10)

If the product detects either the delivery or execution of the initial attack stage then a detection for this stage is recorded.

Action (+10)

When the attack performs one or more actions, while remotely controlling the target, the product should detect at least one of those actions.

Privilege escalation/ action (+10)

As the attack progresses there will likely be an attempt to escalate system privileges and to perform more powerful and insidious actions. If the product can detect either the escalation process itself, or any resulting actions, then a detection is recorded.

Lateral movement/ action (+10)

The attacker may attempt to use the target as a launching system to other vulnerable systems.

Detection Accuracy Ratings		
Product	Detection Accuracy Rating	Detection Accuracy Rating %
Kaspersky Endpoint Security	680	100%
Broadcom Symantec Endpoint Security and Cloud Workload Protection	680	100%
BlackBerry CylancePROTECT + OPTICS	660	97%
CrowdStrike Falcon	660	97%
Anonymous Endpoint Security	640	94%

Detection Ratings are weighted to show that how products detect threats can be subtler than just 'win' or 'lose'.

If this attempt is discovered, or any subsequent action, a detection is reported.

The Detection Rating is calculated by adding points for each group in a threat chain that is detected. When at least one detection occurs in a single group, a 'group detection' is recorded and 10 points are awarded. Each test round contains one threat chain, which itself contains four groups (as listed, left), meaning that complete visibility of each attack adds 40 points to the total value.

A product that detects the delivery of a threat, but nothing subsequently to that, wins only 10 points, while a product that detects delivery and action, but not privilege escalation or lateral behaviours, is rated at 20 for that test round.

4. Legitimate Software Rating

These ratings indicate how accurately the product classifies legitimate applications and URLs, while also taking into account the interactions that the product has with the user. Ideally a product will either not classify a legitimate object or will classify it as safe. In neither case should it bother the user.

We also take into account the prevalence (popularity) of the applications and websites used in this part of the test, applying stricter penalties for when products misclassify very popular software and sites.

Legitimate Software Ratings		
Product	Legitimate Accuracy Ratings	Legitimate Accuracy Ratings (%)
Kaspersky Endpoint Security	648	100%
Broadcom Symantec Endpoint Security and Cloud Workload Protection	648	100%
CrowdStrike Falcon	648	100%
Anonymous Endpoint Security	628	100%
BlackBerry CylancePROTECT + OPTICS	394	61%

Legitimate Software Ratings can indicate how well a vendor has tuned its detection engine.

5. Conclusions

This test exposed market-leading endpoint security products to a diverse set of exploits, file-less attacks and malware, comprising the widest range of threats in any currently available public test.

All of these attack types have been witnessed in real-world attacks over the previous few years. They are representative of a real and present threat to business networks the world over. The threats used in this test are similar or identical to those used by the threat groups listed in **Hackers vs. Targets** on page 10 and **4. Threat Intelligence** on pages 15 – 18.

It is important to note that while the test used the same types of attacks, new files were used. This exercised the tested product's abilities to detect certain approaches to attacking systems rather than simply detecting malicious files that have become well-known over the previous few years. The results are an indicator of potential future performance rather than just a compliance check that the product can detect old attacks.

The good news is that all of the products detected all of the threats on a basic level. By that we mean that in each attack every product detected at least some element of the attack chain. But that is a very basic analysis of the results. In fact, these products

had many opportunities to report and potentially block multiple parts of each attack. For example, they could detect malware appearing on the system, notice when that malware runs, stop bad behaviour on a basic level and kick into action when the attackers attempted deeper hacking attacks.

So while the 'Attacks Detected' results show how many of the intrusions each product noticed, the Detection Accuracy rating shows to what extent the product had insight into the whole attack. You would hope that it would be able to detect and report on malicious actions along different stages of the full attack.

For example, **CrowdStrike Falcon** detected some part of every attack, but achieved a detection accuracy of 97%. This is because it missed some important elements of the attacks. In the Wizard Spider attacks it didn't notice the malicious behaviour of the malware after it ran. It did, however, see every subsequent malicious action. So in practice a security team would be able to see that there was a problem, but there would be a small piece of the jigsaw missing. See its detailed results in **Appendix B: Detailed Response**, page 19. In that section you can see how it handled the full

attack chain in high resolution. Similarly, the **Anonymous Endpoint Security** product didn't notice the delivery of most of the threats. While this seems much worse than the other products tested, it detected the malware running in all but one case. In the vast majority of cases it also detected the hacker escalating privileges in order to take greater control of the target.

BlackBerry's product managed the same Detection Accuracy Rating as **CrowdStrike** but its inaccurate handling of legitimate applications brought its overall Total Accuracy Rating down significantly. It scored an A rating.

The **Anonymous Endpoint Security** product also achieved an AAA rating, but rated lower overall because of its failed initial detections as described above.

Broadcom and **Kaspersky** products achieved perfect results in this test, detecting every element of each threat, and making no mistakes with legitimate applications. **CrowdStrike's** excellent coverage puts it in the same running and all three products achieved an AAA rating.

Appendices

Appendix A: Threat Intelligence

Wizard Spider

Known to have operated since at least 2016, Wizard Spider is considered to be a threat group based in and around St. Petersburg, Russia. It is most notable for developing the TrickBot banking malware. Wizard Spider has infected over a million systems worldwide predominantly by using this malware.

Sandworm

In operation since around 2009, Sandworm Team is threat group that has been connected to Russia's Main Intelligence Directorate of the General Staff of the Armed Forces of the Russian Federation (GRU). It is believed to be the GRU's Unit 74455. Notable campaigns include a targeted attack on the 2017 French Presidential campaign, as well as the worldwide NotPetya ransomware attack in the same year.

Appendix C: Terms Used

Term	Meaning
Compromised	The attack succeeded, resulting in malware running unhindered on the target. In the case of a targeted attack, the attacker was able to take remote control of the system and carry out a variety of tasks without hindrance.
Blocked	The attack was prevented from making any changes to the target.
False positive	When a security product misclassifies a legitimate application or website as being malicious, it generates a 'false positive'.
Neutralised	The exploit or malware payload ran on the target but was subsequently removed.
Complete Remediation	If a security product removes all significant traces of an attack, it has achieved complete remediation.
Target	The test system that is protected by a security product.
Threat	A program or sequence of interactions with the target that is designed to take some level of unauthorised control of that target.
Update	Security vendors provide information to their products in an effort to keep abreast of the latest threats. These updates may be downloaded in bulk as one or more files, or requested individually and live over the internet.

Appendix D: FAQs

A [full methodology](#) for this test is available from our website.

- The test was conducted between 25th April to 7th June 2022.
- This test was conducted independently by SE Labs with similar testing made available to other vendors, at the same time, for their own standalone reports.
- The product was configured according to its vendor's recommendations.
- Targeted attacks were selected and verified by SE Labs.
- Malicious and legitimate data was provided to partner organisations once the test was complete.

Q [What is a partner organisation? Can I become one to gain access to the threat data used in your tests?](#)

A Partner organisations benefit from our consultancy services after a test has been run. Partners may gain access to low-level data that can be useful in product improvement initiatives and have permission to use award logos, where appropriate, for marketing purposes. We do not share data on one partner with other partners. We do not partner with organisations that do not engage in our testing.

Q [We are a customer considering buying or changing part of our security infrastructure. Can you help?](#)

A Yes, we frequently run private testing for organisations that are considering changing their security products. Please contact us at info@selabs.uk for more information.

Appendix E: Product Versions

The table below shows the service's name as it was being marketed at the time of the test.

Product Versions			
Vendor	Product	Build Version (start)	Build Version (end)
BlackBerry	CylancePROTECT + OPTICS	PROTECT 3.0.1001 OPTICS Windows 2.5.3010 OPTICS CentOS 3.2.1108	PROTECT 3.0.1001 OPTICS Windows 2.5.3010 OPTICS CentOS 3.2.1108
Broadcom	Symantec Endpoint Security and Cloud Workload Protection	14.3.7393.4000	14.3.7393.4000
CrowdStrike	Falcon	6.38.15205.0	6.39.15314.0
Kaspersky	Endpoint Security	EDR 4.0	EDR 4.0

Appendix F: Attack Details

Wizard Spider							
Incident no:	Delivery	Execution	Action	Privilege Escalation	Post-Esclation Action	Lateral Movement	Lateral Action
1	Spearphishing Attachment	Windows Command Shell	File and Directory Discovery	Bypass User Account Control	Remote System Discovery	Service Execution	Archive Collected Data
		Malicious File	Process Discovery	Valid Accounts	Security Software Discovery	Domain Accounts	Data staged
		Obfuscated Files or Information	System Information Discovery		LLMNR/NBT-NS Poisoning and SMB Relay		Data from Local System
		Powershell	System Network Configuration Discovery System Owner/User Discovery				Exfiltration Over C2 Channel
2	Spearphishing Link	Malicious Link	File and Directory Discovery	Bypass User Account Control	NTDS	SSH	Archive Collected Data
		Windows Command Shell	Process Discovery	Valid Accounts	Security Account Manager		External Remote Services
		Web Protocols	System Information Discovery		Kerberoasting	Data from Local System	
		Non-standard Port	Permission Groups Discovery System Owner/User Discovery			Exfiltration Over C2 Channel	
3	Spearphishing Attachment	Malicious File	File and Directory Discovery	Bypass User Account Control	Windows Service	Lateral Tool Transfer	Archive Collected Data
		Windows Command Shell	Process Discovery	Valid Accounts	Registry Run Keys / Startup Folder	Remote Desktop Protocol	Data staged
		Web Protocols	System Information Discovery		Scheduled Task	SMB/Windows Admin Shares	Data from Local System
			System Owner/User Discovery		Masquerade Task or Service Winlogon Helper DLL		Exfiltration Over C2 Channel
4	Spearphishing Link	Malicious Link	File and Directory Discovery	Bypass User Account Control	Dynamic-link Library Injection	Windows Remote Management	Archive Collected Data
		Windows Command Shell	Process Discovery	Valid Accounts	Windows File and Directory Permissions Discovery		Data from Local System
		Web Protocols	System Information Discovery				Exfiltration Over C2 Channel
			System Network Configuration Discovery				

Sandworm								
Incident no:	Delivery	Execution	Action	Privilege Escalation	Post-Esclation Action	Lateral Movement	Lateral Action	
5	Spearphishing Attachment	Windows Command Shell	File and Directory Discovery	Domain Accounts	Keylogging	SSH	Cron	
		Malicious File	Process Discovery	Bypass User Account Control	Domain Account (Discovery)		Boot or Logon Initialization Scripts	
		Non-Standard Port	System Information Discovery				Data from Local System	RC Scripts
			Local Data Staging					Systemd Service
			Exfiltration Over C2 Channel					
			Credentials from Web Browsers					
6	Spearphishing Link	Windows Command Shell	File and Directory Discovery	Domain Accounts	Remote System Discovery	SMB/Windows Admin Shares	Data from Local System	
		Powershell	System Information Discovery	Bypass User Account Control	LSASS Memory		Local Data Staging	
		Malicious Link	System Owner/User Discovery				Exfiltration Over C2 Channel	
		Obfuscated Files or Information	Data from Local System				Network Sniffing	
			Local Data Staging Exfiltration Over C2 Channel					
7	Spearphishing Attachment	Windows Command Shell	File and Directory Discovery	Domain Accounts	Domain Account (Discovery)	SSH	Systemd Service	
		Malicious File	System Information Discovery	Bypass User Account Control	LSASS Memory		Kernel Modules and Extensions	
		Web Protocols	System Owner/User Discovery				SSH Authorized Keys	
			System Network Configuration Discovery System Network Connections Discovery					
8	Spearphishing Link	Windows Command Shell	File and Directory Discovery	Domain Accounts	Remote System Discovery	SSH	/etc/passwd and /etc/shadow	
		Malicious Link	System Information Discovery	Bypass User Account Control	Security Software Discovery		Bash History	
			System Owner/User Discovery					
			System Network Configuration Discovery					
			System Network Connections Discovery				Clear Linux or Mac System Logs	

Lazarus Group							
Incident no:	Delivery	Execution	Action	Privilege Escalation	Post-Esclation Action	Lateral Movement	Lateral Action
9	Spearphishing Attachment	Malicious File	File and Directory Discovery	Create Process with Token	Query Registry	Windows Management Instrumentation	Exfiltration Over C2 Protocol
		Obfuscated Files or Information	Process Discovery		File Deletion		Archive Collected Data
		Windows Command Shell	System Information Discovery		Hidden Files and Directories		Service Stop
		Windows Management Instrumentation	System Network Configuration Discovery		Windows Service		System Shutdown/Reboot
10	Spearphishing Attachment	Malicious File	File and Directory Discovery	Create Process with Token	Shortcut Modification	Remote Desktop Protocol	Exfiltration Over C2 Channel
		Windows Command Shell	Process Discovery		Registry Run Keys / Startup Folder		Archive Collected Data
		Match Legitimate Name or Location	System Information Discovery		Disable or Modify System Firewall		Internal Defacement
			System Network Configuration Discovery		Windows Service		Disk Content Wipe
			System Owner/User Discovery				System Shutdown/Reboot
			System Time Discovery				Account Manipulation
Application Window Discovery							
11	Spearphishing Attachment	Malicious File	File and Directory Discovery	Create Process with Token	Dynamic-link Library Injection	Remote Desktop Protocol	Data Destruction
		Windows Command Shell	Process Discovery		Disable or Modify System Firewall		Internal Defacement
		Match Legitimate Name or Location	System Information Discovery		Keylogging		File Deletion
			System Owner/User Discovery		Archive Collected Data		Disk Structure Wipe
12	Spearphishing Attachment	Malicious File	File and Directory Discovery	Create Process with Token	Timestomp	Remote File Copy	Keylogging
		Windows Command Shell	Process Discovery		Archive Collected Data		Archive Collected Data
		Exploitation for Client Execution	System Information Discovery		File Deletion		File Deletion
			System Network Configuration Discovery		Exfiltration Over C2 Channel		Exfiltration Over Unencrypted/Obfuscated Non-C2 Protocol
			System Owner/User Discovery		Password Spraying		Internal Defacement
			System Time Discovery		Disable or Modify Tools		
			Data Staging				

Operation Wocao
