Subject: Removing NAVGEM Input from Some NBM Probabilistic Temperature
Quantile Mapping Forecasts for the CONUS Domain: Effective
April 12, 2022

Effective on or about Tuesday, April 12, 2022, beginning with the 1200 Coordinated Universal Time (UTC) model run, the NWS NCEP Central Operations will implement an update to the National Blend of Models (NBM) guidance over the CONUS Forecast Database (NDFD) domain. This update will remove the NAVGEMD (Navy FNMOC Global deterministic) and NAVGEME (Navy FNMOC Global Ensemble) from the NBM's Probabilistic Daily Maximum (PMaxT) and Probabilistic Daily Minimum Temperature (PMinT) Quantile Mapping forecasts for the contiguous U.S. (CONUS) domain.

In the event that the implementation date is declared a Critical Weather Day (CWD), or significant weather is occurring or is anticipated to occur, implementation of this change will occur at 1200 UTC on the next weekday not declared a CWD and when no significant weather is occurring.

Stakeholders such as the NWS's Western and Central Region WFOs have expressed concern that the NBM CONUS PMaxT and PMinT percentiles are overdispersed and generating unrealistic probabilistic guidance. In some instances, NBM guidance is predicting record high temperatures far above anything that has been experienced to date. After careful analysis of this issue, it has been determined that the NAVGEMD and NAVGEME occasionally have unrealistic solutions in their temperature suite over land areas. This results in overdispersed NBM forecasts after quantile mapping bias correction is applied. To mitigate this issue until such time as the NAVGEMD and NAVGEME issues are resolved, the NBM will be removing the NAVGEMD and NAVGEME as inputs from its PMaxT and PMinT product. MDL has made these modifications and intends to update NBM v4.0 with these changes in this forthcoming implementation.

Any questions, comments or requests regarding this implementation should be directed to the contacts below.
