1 INTRODUCTION

This study analyzes the transportation and traffic impacts of the Amoruso Ranch Specific Plan project in Roseville, California. It builds off the *Final Traffic Study for the Amoruso Ranch Specific Plan* (Fehr & Peers, February 2016) to evaluate four land use alternatives against the Cumulative No Project scenario of that transportation impact study (TIS).

This study evaluates traffic impacts at five intersections and two freeway segments. These are facilities that were significantly impacted by the Proposed Project, as identified in the *Final Traffic Study for the Amoruso Ranch Specific Plan* in the 2035 Cumulative scenario peak hours. These facilities are listed below:

Placer County Intersections (AM Peak Hour Analysis)

1. Cook Riolo Road / PFE Road
2. N Foothills Boulevard / Athens Avenue

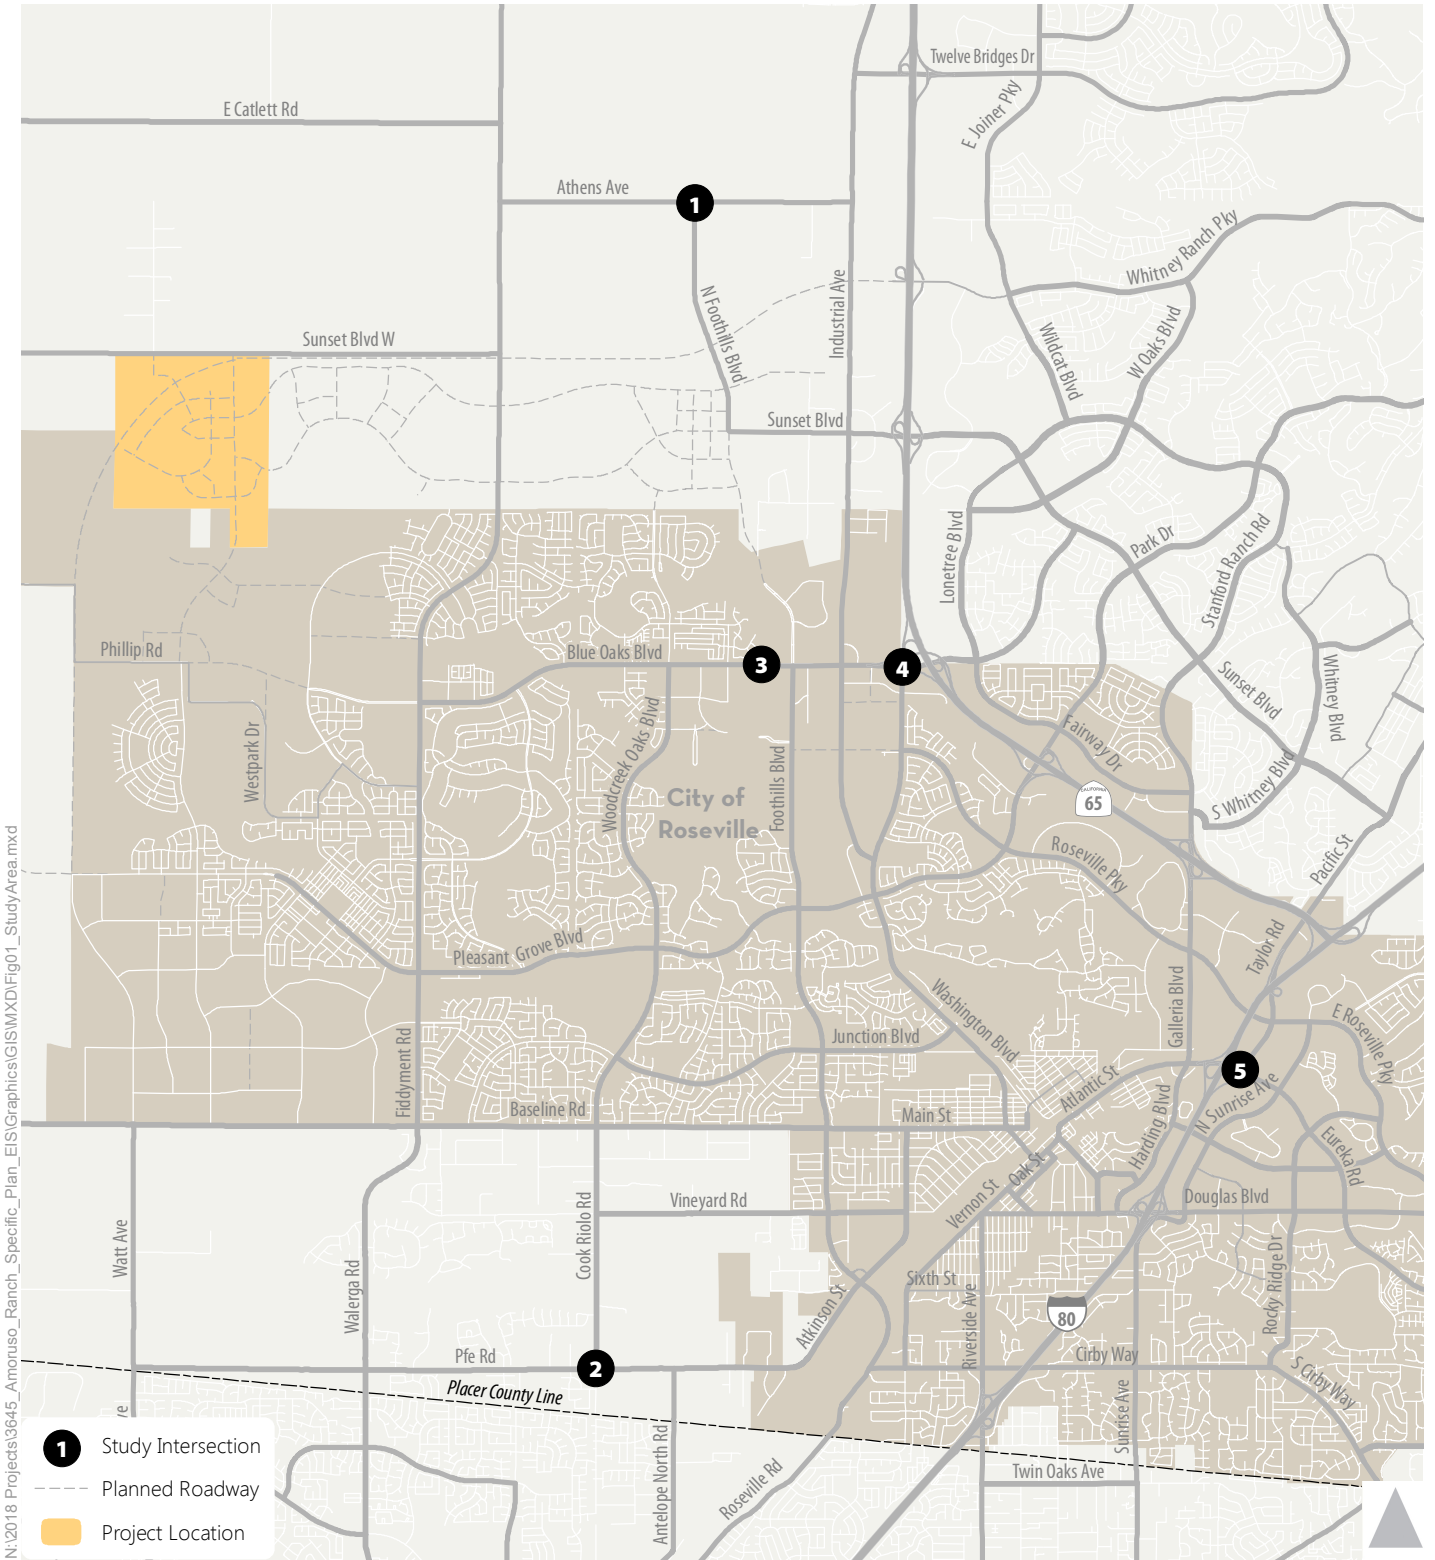

City of Roseville Intersections (PM Peak Hour Analysis)

3. Blue Oaks Boulevard / Collector C
4. Blue Oaks Boulevard / Washington Boulevard / SR 65 Southbound (SB) Ramps
5. Eureka Road / Taylor Rd / I-80 Eastbound (EB) Ramps

Freeway Facilities (AM Peak Hour Analysis)

- SR 65 Southbound (SB) between Ferrari Ranch Road and Lincoln Boulevard
- SR 65 Southbound (SB) between Twelve Bridges Drive and Placer Parkway

The study intersections as well as the location of the Amoruso Ranch Specific Plan are shown in Figure 1. This study focuses exclusively on the roadway network and does not include any descriptions or evaluations of other modes such as transit, walking, or bicycling because none of the project alternatives would materially affect these modes of travel in a manner different from that of the Proposed Project.

Note: Study intersections shown here were identified as cumulatively significant impacts in the Amoruso Ranch Specific Plan Draft EIR.

Figure 1
Study Area

1.1 Project Description

As shown in Figure 1, the Proposed Project would be situated on approximately 674 acres north of Blue Oaks Boulevard, west of Fiddymont Road, and south of Sunset Boulevard West. Project access would be provided to / from the south via the construction of Westbrook Boulevard to Blue Oaks Boulevard. Access would be provided from the north via two roadway connections to Sunset Boulevard West. Additionally, future year scenarios also include the construction of Placer Parkway (to / from the north), which would intersect with Westbrook Boulevard.

The land use inputs for the project alternatives were provided from Impact Sciences in April 2018. As mentioned previously, there are four land use alternatives. These alternatives are summarized in Table 1.

Table 1: Land Use Alternatives

| Land Use | No Action | Proposed Action | Alternative 1 - South Avoidance | Alternative 2 – North Avoidance | Alternative 3 – Distributed Avoidance |
|----------------------------|--------------|-----------------|---------------------------------|---------------------------------|---------------------------------------|
| Low Density Residential | 773 du | 1,302 du | 1,078 du | 1,158 du | 1,211 du |
| Medium Density Residential | 322 du | 542 du | 421 du | 449 du | 546 du |
| High Density Residential | 519 du | 873 du | 700 du | 701 du | 864 du |
| Community Commercial | 65 du | 109 du | 109 du | 109 du | 109 du |

| Office | 20 ksf | 34 ksf | 34 ksf | 34 ksf | 34 ksf |
| Elementary School | 800 students | 800 students | 800 students | 800 students | 800 students |

Source: Impact Sciences, April 2018

It is important to note that the “No Action” scenario differs from what was studied in the *Final Traffic Study for the Amoruso Ranch Specific Plan* for the “No Project” Condition. In the previous study, “No Project” (e.g. Cumulative No Project) implied that there was no land use developed at the Amoruso site. However, in this study, the “No Action” alternative contains land use, but far less land use than the project alternatives. The “No Project” scenario from the *Final Traffic Study for the Amoruso Ranch Specific Plan* is used as the baseline for this analysis.

The “Proposed Action” alternative differs from the Proposed Project in the *Final Traffic Study for the Amoruso Ranch Specific Plan*. The Proposed Action alternative contains 1,302 low-density dwelling units and 542 medium-density dwelling units, whereas the Proposed Project in the *Final Traffic Study for the Amoruso Ranch Specific Plan* contains 1,167 low-density and 786 medium-density dwelling units. The Proposed Action generates approximately two percent (less than 1,000) fewer daily trips than the Proposed Project from the 2016 study. Because the difference in the Proposed Action versus the Proposed Project is marginal¹, the Proposed Action alternative is not studied in this report.

1.1 Analysis Scenarios

The following scenarios are presented or analyzed in this report:

- Existing Conditions – a summary of the Existing Conditions section of the *Final Traffic Study for the Amoruso Ranch Specific Plan*
- Cumulative No Project Conditions – represents 2035 conditions with no land use in the Amoruso Ranch site
- Cumulative No Action Conditions – represents 2035 conditions and buildout of the No Action alternative
- Cumulative Plus Alternative 1 Conditions – represents 2035 conditions and buildout of the South Avoidance alternative
- Cumulative Plus Alternative 2 Conditions – represents the 2035 conditions and buildout of the North Avoidance alternative
- Cumulative Plus Alternative 3 Conditions – represents the 2035 conditions and buildout of the Distributed Avoidance alternative.

As mentioned previously, the Cumulative Plus Proposed Action alternative is not evaluated in this report because its operating conditions would be nearly identical to the Cumulative Plus Project scenario studied in the *Final Traffic Study for the Amoruso Ranch Specific Plan*.

1.2 Analysis Methods

This study analyzes traffic operations using level of service (LOS) as the primary measure of performance. Automobile LOS is a qualitative description of traffic flow from the perspective of motorists. The *Highway Capacity Manual* (HCM) defines six levels of service from LOS A, representing the least congested traffic conditions, to LOS F, representing the most congested traffic conditions.

¹ Proposed Action is 109 fewer total single family dwelling units with the percentage of all single-family units increasing from 60 to 70 percent.

These grades represent the perspective of drivers and are an indication of the comfort and convenience associated with driving, as well as speed, travel time, traffic interruptions, and freedom to maneuver.

1.2.1 Signalized Intersections

All signalized intersections within the City of Roseville were analyzed using procedures from the HCM. For this study, the three study intersections were analyzed in SimTraffic software, to remain consistent with the analysis in the *Final Traffic Study for the Amoruso Ranch Specific Plan*. Average overall delay and LOS are reported for these intersections. Table 2 shows the signalized LOS criteria for intersections.

1.2.2 Unsignalized Intersections

Unsignalized intersections in Placer County were analyzed using Synchro, which employs procedures from HCM 2000. For all-way stop-controlled intersections, average overall delay and LOS is reported. For side-street stop-controlled intersections, the delay and LOS of the overall intersection and the intersection's worst movement is reported. This reporting format for side-street stop-controlled intersections matches the 2016 study but differs for the current format required by Placer County, which shows the overall weighted average delay and LOS of movements that must yield right-of-way. Table 2 shows the unsignalized LOS criteria for unsignalized intersections.

Although Placer County standards require using the 2017 version of the HCM to analyze intersections, this study uses the 2000 HCM to preserve consistency with the *Final Traffic Study for the Amoruso Ranch Specific Plan*. Comparisons of results between the two methodologies have shown very little variation (i.e., delays changing less than one second) in results.

Table 2: Intersection Level of Service Criteria

| Level of Service | Description | Delay in Seconds | |
|------------------|---|------------------|----------------|
| | | Signalized | Unsignalized |
| A | Progression is extremely favorable and most vehicles arrive during the green phase. Most vehicles do not stop at all. Short cycle lengths may also contribute to low delay. | ≤ 10.0 | ≤ 10.0 |
| B | Progression is good, cycle lengths are short, or both. More vehicles stop than with LOS A, causing higher levels of average delay. | > 10.0 to 20.0 | > 10.0 to 15.0 |
| C | Higher congestion may result from fair progression, longer cycle lengths, or both. Individual cycle failures may begin to appear at this level, though many still pass through the intersection without stopping. | > 20.0 to 35.0 | > 15.0 to 25.0 |
| D | The influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high volume to capacity ratios (V/C) ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable. | > 35.0 to 55.0 | > 25.0 to 35.0 |

Table 2: Intersection Level of Service Criteria

| Level of Service | Description | Delay in Seconds | |
|------------------|---|------------------|----------------|
| | | Signalized | Unsignalized |
| E | This level is considered by many agencies to be the limit of acceptable delay. These high delay values generally indicate poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences. | > 55.0 to 80.0 | > 35.0 to 50.0 |
| F | This level is considered unacceptable with oversaturation, which is when arrival flow rates exceed the capacity of the intersection. This level may also occur at high V/C ratios below 1.0 with many individual cycle failures. Poor progression and long cycle lengths may also be contributing factors to such delay levels. | > 80.0 | > 50.0 |

Source: *Highway Capacity Manual 2010*, Transportation Research Board, 2010.

1.2.3 Freeway Facilities

Per Caltrans standards, freeway operations are evaluated using methodologies from the HCM. The LOS for freeway segments is based on the vehicle density (passenger car equivalents per hour per mile per lane) as shown in Table 3.

Table 3: Freeway Level of Service Criteria

| Level of Service | Density (pcphpmpl) ¹ | | Description |
|------------------|---------------------------------|--------------------------------------|--|
| | Mainline | Ramp Junctions | |
| A | ≤ 11 | ≤ 10 | Free-flow operations. Drivers are almost completely unimpeded in their ability to maneuver within the traffic stream. |
| B | > 11 to 18 | > 10 to 20 | Free-flow speeds are maintained. The ability to maneuver within the traffic stream is only slightly restricted. |
| C | > 18 to 26 | > 20 to 28 | Traffic flow with speeds at or near free-flow speed. The freedom to maneuver within the traffic stream is noticeably restricted, and lane changes require more care and vigilance on the part of the driver. |
| D | > 26 to 35 | > 28 to 35 | Speeds begin to decline slightly with increasing flows. Freedom to maneuver within the traffic stream is noticeably limited. |
| E | > 35 to 45 | > 35 | Operations at or near capacity. There are virtually no useable gaps within the traffic stream, leaving little room to maneuver. |
| F | > 45 or Demand exceeds capacity | Demand exceeds capacity ² | Breakdown in vehicular flow. Vehicular demand exceeds capacity. |

Notes:

1. Density is expressed in passenger car equivalents per hour per mile per lane (pcphpmpl). Density values are rounded to the nearest whole value and evaluated for LOS based on the above thresholds (i.e., 35 pcphpmpl = LOS D)
2. Occurs when freeway demand exceeds upstream (diverge) or downstream (merge) freeway segment capacity, or if off-ramp demand exceeds off-ramp capacity.

Source: *Highway Capacity Manual 2010*, Transportation Research Board, 2010.

1.3 Significance Criteria

The following thresholds of significance have been used to determine whether implementing the Proposed Project alternatives would result in a significant transportation impact. The thresholds of significance are derived from questions posed in Appendix G of the CEQA Guidelines, thresholds of significance from applicable plans and previous environmental documents, and professional judgement.

1.3.1 City of Roseville

The City of Roseville's *General Plan 2035* (June 2016) identifies a level of service policy that calls for maintaining LOS C or better operations at a minimum of 70 percent of all signalized intersections and roadway segments in the City during the AM and PM peak hours. Exceptions to the LOS C standard may be considered for intersections where the City finds that the required improvements are unacceptable based on established criteria identified in the implementation measures. In addition, Pedestrian Overlay Districts may be exempted from the LOS standard.

The project would have a significant impact if it would:

1. Cause a signalized intersection in Roseville to be degraded as follows under Existing or Cumulative Conditions during the AM or PM peak hours:
 - a. For intersections that currently operate at LOS C or better: worsen operations to LOS D or worse.
 - b. For intersections that currently operate at less than LOS C: cause operations to further worsen by one or more service levels.
2. Cause the overall percentage of signalized intersections throughout the City of Roseville operating at LOS C or better during the AM or PM peak hours to fall below 70 percent.

1.3.2 Placer County

The Placer County *General Plan* (May 2013) establishes a minimum LOS C threshold for County roadways and intersections, except within one-half mile of state highways where the standard is LOS D.

The project would have a significant impact if it would:

1. Cause an unsignalized intersection in Placer County (located beyond one-half mile of a state highway) to worsen from LOS C or better to LOS D or worse during the AM or PM peak hours.
2. Cause an unsignalized intersection in Placer County that is already (or projected to be) operating unacceptably during the AM or PM peak hours to experience a three-second or greater increase in delay.

Criterion are not provided for unsignalized intersections located within one-half mile of a state highway or signalized intersections because all study intersections are beyond within one-half mile of state highway and not signalized.

1.3.3 Caltrans

The *State Route 65 Corridor System Management Plan* (CSMP) (Caltrans, 2009) identifies a 20-year concept LOS E for SR 65 north of Blue Oaks Boulevard into and through City of Lincoln. The document notes that “no further degradation of service from existing ‘F’ is acceptable, as indicated by delay performance measurement.”

For freeway facilities, the applicable performance standard is density, which is expressed in passenger cars per hour per mile per lane. Since density values are rounded to the nearest integer value for reporting purposes, a minimum density increase of 0.5 would, by definition, cause an increase in the reported density measurement. Density is not reported for LOS F conditions but is reported for LOS A through E conditions. Through an iterative process, it was determined that a 40-peak hour vehicle increase in a given direction to a four-lane freeway operating at LOS E would approximately correspond to a 0.5 increase in density. Similarly, a 60-peak hour vehicle increase in a given direction to a six-lane freeway operating at LOS E would approximately correspond to a 0.5 increase in density. Accordingly, these thresholds of significance were used for segments operating at LOS F.

The project would have a significant impact if it would:

1. Cause a facility maintained by Caltrans to worsen from acceptable to unacceptable operations during the AM or PM peak hours.
2. Worsen unacceptable operations to a significant degree (as indicated by a change in the applicable performance measure) at a facility maintained by Caltrans during the AM or PM peak hours.
3. Cause traffic at an off-ramp maintained by Caltrans to queue back to the mainline or add traffic to an off-ramp that already queues back to the mainline.

2 EXISTING CONDITIONS

This section summarizes the Existing Conditions at the time the *Final Traffic Study for the Amoruso Ranch Specific Plan* was prepared. The counts for this study were conducted in January 2014.

2.1 City of Roseville Intersection Analysis

The signalized intersections in the City of Roseville were studied using SimTraffic software to apply the methodologies described in the *Highway Capacity Manual*. Table 4 summarizes the PM peak hour operations at the study intersections located in the City of Roseville. Table 4 shows that the Blue Oaks Boulevard / Washington Boulevard / SR 65 SB Ramps and Eureka Road / Taylor Road / I-80 EB Ramps intersections operate at LOS D.

During the PM peak hour, 81 percent of the 165 signalized intersections in City of Roseville operate at LOS C or better. Of the 30 intersections not operating at LOS C or better, 24 intersections operate at LOS D and six operate at LOS E.

Table 4: City of Roseville Signalized Intersection Operations – Existing Conditions

| Intersection | PM Peak Hour Delay (s) / LOS |
|---|------------------------------|
| Blue Oaks Blvd / Collector C | Does Not Exist |
| Blue Oaks Blvd / Washington Blvd / SR 65 SB Ramps | 37 / D |
| Eureka Rd / Taylor Rd / I-80 EB Ramps | 44 / D |

Source: *Final Traffic Study for Amoruso Ranch Specific Plan*, Fehr & Peers, 2016.

2.2 Placer County Intersection Analysis

Table 5 displays the AM Peak Hour operations at study intersections outside of Roseville, in Placer County. Both study intersections operate acceptably at LOS B or better. The worst movement for N Foothills Boulevard / Athens Avenue is the northbound left, which operates at LOS B.

Table 5: Placer County Intersection Operations – Existing Conditions

| Intersection | Traffic Control | AM Peak Hour Delay (s) / LOS |
|--|-----------------|------------------------------|
| Cook Riolo Rd / PFE Rd ¹ | AWSC | 15 / B |
| N Foothills Blvd / Athens Ave ² | SSSC | 2 (11) / A (B) |

Notes:

AWSC = All-Way Stop-Control. SSSC = Side-Street Stop-Control

- 1) For all-way stop-controlled intersections in Placer County, the overall delay and LOS is shown.
- 2) For side-street stop-controlled intersections the overall delay and LOS is shown without parenthesis and the worst movement delay and LOS in parenthesis.

Source: *Final Traffic Study for Amoruso Ranch Specific Plan*, Fehr & Peers, 2016.

2.3 Freeway Analysis

Table 6 presents the AM Peak Hour operations at the two freeway study facilities. Both operate acceptably at LOS D or better.

Table 6: Freeway Operations – Existing Conditions

| Freeway Segment | Segment Type | Lanes | AM Peak Hour | |
|---|--------------|-------|---------------------------------|-----|
| | | | Density (pcphmpl ¹) | LOS |
| SR 65 SB between Ferrari Ranch Rd and Lincoln Blvd | Basic | 2 | 18 | C |
| SR 65 SB between Twelve Bridges Dr and Sunset Blvd ² | Basic | 2 | 27 | D |

Notes:

- 1) Density is expressed in passenger car equivalents per hour per mile per lane (pcphmpl). Density values are rounded to the nearest whole value.
- 2) The segment of SR 65 SB between Twelve Bridges Dr and Sunset Blvd. is reported because the Whitney Ranch Parkway interchange was not constructed at the time of the counts and analysis.

Source: *Final Traffic Study for Amoruso Ranch Specific Plan*, Fehr & Peers, 2016.

3 PROJECT TRAVEL CHARACTERISTICS

This section describes the project's travel characteristics. It presents the trip generation of each alternative in relation to the Proposed Project of the *Final Traffic Study for the Amoruso Ranch Specific Plan*.

The project's vehicular trip generation was estimated based on trip rates published in *Trip Generation Manual, 9th Edition* (Institute of Transportation Engineers, 2012) to maintain consistency with the *Final Traffic Study for the Amoruso Ranch Specific Plan* (versus using the 2017 Trip Generation Manual update). Table 7 shows the trip generation of the different land use alternatives for the Amoruso Specific Plan.

Table 7: Trip Generation Land Use Alternatives

| Land Use | Quantity | Trip Rate | | | Trips | | |
|--|--------------|-----------|--------------|--------------|--------|--------------|--------------|
| | | Daily | AM Peak Hour | PM Peak Hour | Daily | AM Peak Hour | PM Peak Hour |
| No Action | | | | | | | |

Source: Fehr & Peers, 2018.

The internalization of trips within the project site was estimated using a Mixed-Use Trip Generation Model (MXD), which was developed for the US Environmental Protection Agency (EPA) to estimate internal trip-making and external trips by non-auto travel modes. This model was developed by consultants and academic researchers to more accurately estimate the external vehicular trip generation of mixed-use land development projects than prior methods (e.g., ITE internalization spreadsheet). At the time of the *Final Traffic Study for the Amoruso Ranch Specific Plan* study, the model was developed based on empirical evidence at 240 mixed-use projects located across the US. The model considers various built environment variables, such as land use density, regional location, proximity to transit, and various design variables when calculating the project’s internal trips, and external trips made by auto, transit, and non-motorized vehicles. The MXD model has been applied in numerous EIRs throughout California. The same methodology was used for the Proposed Project in the *Final Traffic Study for the Amoruso Ranch Specific Plan*, the trip generation of which is shown in Table 8.

Table 8: Trip Generation of Proposed Project in *Final Traffic Study for the Amoruso Ranch Specific Plan* (2016)

| Land Use | Quantity | Trip Rate | | | Trips | | |

4 2035 CUMULATIVE CONDITIONS

This chapter describes the analysis of project alternative impacts under 2035 Cumulative Conditions for each project alternative. Cumulative Conditions represent projected future conditions based on proposed land developments and planned roadway improvements. The forecasts from the City of Roseville 2035 Cumulative model from the *Final Traffic Study for the Amoruso Ranch Specific Plan* are described below.

4.1 Land Use and Roadway Network Assumptions

This scenario assumes the following land use and roadway network improvements which were coded into the City of Roseville 2035 travel demand model that was used for the *Final Traffic Study for the Amoruso Ranch Specific Plan*:

Land Use Assumptions

- Build-out of City of Roseville (existing City including approved specific plans)
- Build-out of Regional University Specific Plan
- Build-out of Phase 1 of Placer Vineyards
- 2035 levels of residential market absorption in City of Lincoln
- Build-out of residential and 2035 market absorption levels of non-residential in City of Rocklin
- SACOG 2035 market absorption for specific projects outside of South Placer county including the Elverta Specific Plan (Sacramento County), Johnson Ranchos (Wheatland), and Sutter Pointe (Sutter County)
- Partial build-out of Placer Ranch (50% residential, 25% non-residential, and 25,000-student university)
- Campus Oaks (HP Campus Rezone) project including the extension of Roseville Parkway as a two- to four-lane street from Foothills Boulevard through the HP Campus northwesterly to Blue Oaks Boulevard

Roadway Network Assumptions

- I-80 improvements including new auxiliary lanes on EB I-80 from SR 65 to Rocklin Road and on WB I-80 from Douglas Boulevard to Riverside Avenue (included as a Tier 1 project in SACOG's 2035 MTP / SCS)

- Highway 65 is widened to six continuous lanes between I-80 and Blue Oaks Boulevard (partial funding being collected through SPRTA fee program, full funding expected to be available for construction in 21-year horizon period according to City staff)
- Baseline / Riego Road is widened to six lanes from Fiddymment Road to SR 99 through Roseville, Placer County, and Sutter County (funded through fee programs and local developer frontage improvement requirements)
- SR 99 / Riego Road interchange is constructed (now complete)
- Watt Avenue is widened to six lanes between Baseline Road and Sacramento County line, and to four lanes from the County line to Antelope Road (funded through fee programs and local developer frontage improvement requirements)
- Walerga Road is four lanes between Baseline and Sacramento County line (funded through fee programs and local developer frontage improvement requirements)
- Santucci Boulevard is constructed as six lanes from Baseline Road to Blue Oaks Boulevard (funded through City of Roseville CIP and local developer frontage improvement requirements).
- Blue Oaks Boulevard is widened to eight lanes from SR 65 to Woodcreek Oaks Boulevard, and six lanes from Woodcreek Oaks Boulevard to Santucci Boulevard (funded through City of Roseville CIP and local developer frontage improvement requirements)
- Placer Parkway Phase 1 is constructed as four lanes from SR 65 to Foothills Boulevard (included as a Tier 1 project in SACOG's 2035 MTP / SCS)
- Sunset Boulevard is widened to four lanes from west of SR 65 to Cincinnati Avenue (funded through Placer County CIP)
- Sunset Boulevard is widened to six lanes east of SR 65 (based on City of Rocklin General Plan Circulation Element Diagram 4-8, October 2012)
- Fiddymment Road is widened to four lanes from the Roseville city limits to Athens Avenue (included as a Tier 1 project in SACOG's 2035 MTP / SCS)
- Extension of Placer Parkway westerly as a four-lane roadway from Foothills Boulevard to Santucci Boulevard

These improvements were input into the City of Roseville 2035 travel demand model. The roadway network improvements are funded through various sources, including but not limited to the City of Roseville Capital Improvement Program (CIP).

4.2 Traffic Forecasts

In the *Final Traffic Study for the Amoruso Ranch Specific Plan*, Cumulative traffic forecasts were developed using a process called the difference method. This procedure accounts for potential differences between the base year and existing traffic counts that could otherwise transfer to the future year traffic forecast. This forecasting procedure is calculated as follows:

$$2035 \text{ Cumulative Forecast} = \text{Existing Traffic Count} + \\ (2035 \text{ Cumulative Raw Model Volume} - \text{Base Year Raw Model Volume})$$

4.3 Plus Project Traffic Forecasting Methodology

In the *Final Traffic Study for the Amoruso Ranch Specific Plan*, the Proposed Project's land uses were added to the Cumulative year version of the City of Roseville travel demand model. The model was run, and the results were checked to confirm that the external vehicle trips generated from the project's traffic analysis zones matched the trip generation totals in Table 8. The model's predicted difference in trips at the study intersections, roadways, and freeway facilities was added to the existing volumes to yield "Cumulative Plus Project" traffic forecasts. This process is not a simple layering of project trips on top of "Cumulative No Project" volumes, rather, it considers the effects that the project could have on subregional travel patterns.

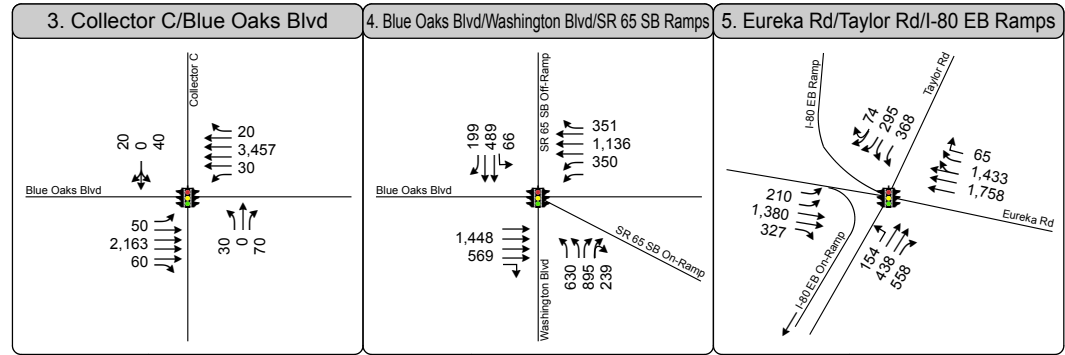

Traffic forecasts for the three project alternatives were developed using the same process as was used in *Final Traffic Study for the Amoruso Ranch Specific Plan*. The intersection forecasts for Cumulative No Project conditions are shown in Figure 2. The intersection forecasts for the No Action alternative as well as Alternatives 1, 2, and 3, are shown in Figure 3, Figure 4, Figure 5, and Figure 6, respectively.

4.4 City of Roseville Intersection Analysis

Consistent with the *Final Traffic Study for the Amoruso Ranch Specific Plan*, the intersections were studied in SimTraffic software to apply the methodologies to calculate intersection delay and level of service from the *Highway Capacity Manual*. The results of this study are shown in Table 10.

Table 10: City of Roseville PM Peak Hour Intersection Operations - Cumulative Conditions

| Intersection | Delay (s) / LOS | | | | |
|---|-----------------------|----------------------|-------------------------------|-------------------------------|-------------------------------|
| | Cumulative No Project | Cumulative No Action | Cumulative Plus Alternative 1 | Cumulative Plus Alternative 2 | Cumulative Plus Alternative 3 |
| Blue Oaks Blvd / Collector C | 32 / C | 34 / C | 45 / D | 45 / D | 45 / D |
| Blue Oaks Blvd / Washington Blvd / SR 65 SB Ramps | 52 / D | 51 / D | 55 / E | 56 / E | 56 / E |
| Eureka Rd / Taylor Rd / I-80 EB Ramps | 53 / D | 53 / D | 54 / D | 54 / D | 56 / E |

Source: Fehr & Peers, 2018.

Because the PM Peak Hour trip generation for Alternative 3 is 95 percent of that of the Proposed Project, the level of service results for the study intersections under Cumulative Plus Alternative 3 Conditions match that of Cumulative Plus Project in the *Final Traffic Study for the Amoruso Ranch Specific Plan*, except for the Eureka Road / Taylor Road / I-80 EB Ramps intersection. Under Cumulative Plus Project Conditions in the *Final Traffic Study for the Amoruso Ranch Specific Plan*, this intersection operates with 55 seconds of delay, which is on the threshold between LOS D and LOS E. This difference is likely the result of variation in SimTraffic runs.

According to Table 10, the project would cause the following impacts:

- Blue Oaks Boulevard / Collector C: degrades from LOS C under Cumulative No Project Conditions to LOS D under Cumulative Plus Alternative 1, Cumulative Plus Alternative 2, and Cumulative Plus Alternative 3 Conditions
- Blue Oaks Boulevard / Washington Boulevard / SR 65 SB Ramps: degrades from LOS D under Cumulative No Project Conditions to LOS E under Cumulative Plus Alternative 1, Cumulative Plus Alternative 2, and Cumulative Plus Alternative 3 Conditions
- Eureka Road / Taylor Road / I-80 EB Ramps: degrades from LOS D under Cumulative No Project Conditions to LOS E under Cumulative Plus Alternative 3 Conditions

4.5 Placer County Intersection Analysis

Table 11 shows the results of the AM Peak Hour intersection analysis for the Placer County study intersections. For consistency with the *Final Traffic Study for the Amoruso Ranch Specific Plan*, this analysis was performed in Synchro to apply the methodologies for calculating intersection delay and level of service in the *Highway Capacity Manual*.

Table 11: Placer County AM Peak Hour Intersection Operations - Cumulative Conditions

| Intersection | Traffic Control | Delay (s) / LOS | | | | |
|-------------------------------|-----------------|-----------------------|----------------------|-------------------------------|-------------------------------|-------------------------------|
| | | Cumulative No Project | Cumulative No Action | Cumulative Plus Alternative 1 | Cumulative Plus Alternative 2 | Cumulative Plus Alternative 3 |
| Cook Riolo Rd / PFE Rd | AWSC | 193 / F | 200 / F | 203 / F | 203 / F | 205 / F |
| N Foothills Blvd / Athens Ave | SSSC | 68 (352) / F (F) | 94 (475) / F (F) | 105 (527) / F (F) | 106 (531) / F (F) | 111 (554) / F (F) |

AWSC = All-Way Stop-Control. SSSC = Side-Street Stop-Control

- 1) For all-way stop-controlled intersections in Placer County, the overall delay and LOS is shown.
- 2) For side-street stop-controlled intersections the overall delay and LOS is shown without parenthesis and the worst movement delay and LOS in parenthesis.

Source: Fehr & Peers, 2018.

Table 11 shows that both study intersections operate unacceptably at LOS F under Cumulative No Project Conditions, and operations are exacerbated with all project alternatives.

4.6 Freeway Analysis

Table 12 shows the results of the freeway operations analysis for the two freeway study segments under all Cumulative alternatives.

Table 12: AM Peak Hour Freeway Operations - Cumulative Conditions

| Freeway Segment | Segment Type | Density (pcmp ^l) / LOS | | | | |
|--|--------------|------------------------------------|----------------------|-------------------------------|-------------------------------|-------------------------------|
| | | Cumulative No Project | Cumulative No Action | Cumulative Plus Alternative 1 | Cumulative Plus Alternative 2 | Cumulative Plus Alternative 3 |
| SR 65 SB between Ferrari Ranch Rd and Lincoln Blvd | Basic | 44 / E | 45 / E | 45 / E | - / F | - / F |
| SR 65 SB between Twelve Bridges Dr and Placer Pkwy | Basic | 45 / E | - / F | - / F | - / F | - / F |

Density not reported for facilities operating at LOS F

Source: Fehr & Peers, 2018.

According to Table 12, SR 65 SB between Ferrari Ranch Road and Lincoln Boulevard operates acceptably at LOS E under Cumulative No Project, Cumulative No Action, and Cumulative Plus Alternative 1 Conditions, but operations worsen to unacceptable LOS F under Cumulative Plus Alternative 2 and Cumulative Plus Alternative 3 Conditions.

SR 65 SB between Twelve Bridges Drive and Placer Parkway operates acceptably at LOS E under Cumulative No Project Conditions but degrades to unacceptable operations (LOS F) for all project alternatives, including the No Action Alternative..

5 IMPACTS AND MITIGATION MEASURES

This chapter presents the cumulatively significant impacts to various intersections and freeway facilities. Specific impacts are described below, followed by recommended mitigation measures.

Impact TR-1 The project would cause signalized intersections in the City of Roseville to be degraded to a significant degree under Cumulative Conditions. This is considered a significant impact.

The project would cause the operations of the following intersections to degrade during the PM peak hour under Cumulative Conditions. This would be considered a **significant impact**.

- Blue Oaks Boulevard / Collector C: degrades from LOS C under Cumulative No Project Conditions to LOS D under Cumulative Plus Alternative 1, Cumulative Plus Alternative 2, and Cumulative Plus Alternative 3 Conditions
- Blue Oaks Boulevard / Washington Boulevard / SR 65 SB Ramps: degrades from LOS D under Cumulative No Project Conditions to LOS E under Cumulative Plus Alternative 1, Cumulative Plus Alternative 2, and Cumulative Plus Alternative 3 Conditions
- Eureka Road / Taylor Road / I-80 EB Ramps: degrades from LOS D under Cumulative No Project Conditions to LOS E under Cumulative Plus Alternative 3 Conditions

Mitigation Measures: No feasible mitigations are available for these three impacted intersections. This is the same finding as the *Final Traffic Study for the Amoruso Ranch Specific Plan*. Each location is discussed below:

- *Blue Oaks Boulevard / Collector C*: This intersection would be situated 1,175 feet west of the Foothills Boulevard / Blue Oaks Boulevard intersection. Much of the delay at the Blue Oaks Boulevard / Collector C intersection is caused from the queue spill back from Blue Oaks Boulevard / Foothills Boulevard. In the *Final Traffic Study for the Amoruso Ranch Specific Plan*, the Blue Oaks Boulevard / Foothills Boulevard operated at LOS F under both Cumulative No Project and Cumulative Plus Project Conditions and could only serve 86 percent and 82 percent of travel demand, respectively. Because of these poor operations, it is unlikely that signal

timing modifications at either intersection along the corridor could restore operations at Blue Oaks Boulevard / Collector C to LOS C operations.

- *Blue Oaks Boulevard / Washington Boulevard / SR 65 Ramps*: The Cumulative Conditions analysis assumes additional planned widening (i.e., second northbound right-turn lane and third westbound through lane). No additional widening is possible.
- *Eureka Road / Taylor Road / I-80 EB Ramps*: Beyond what is currently constructed, only a second westbound right-turn lane is planned on Taylor Road in the future. This lane is assumed in place for the Cumulative Conditions analysis. No additional widening is possible.

No feasible mitigation measures are available for the significant impacts at the above three intersections, whose impacts would be considered **significant and unavoidable**.

Impact TR-2 All project alternatives would cause intersections outside of the City of Roseville to be degraded to a significant degree under Cumulative Conditions. This is considered a significant impact.

The project would cause the following unsignalized, Placer County intersections to experience degraded operations during the AM Peak Hour under Cumulative Conditions. This would be considered a **significant impact**.

- *Cook Riolo Road / PFE Road*: LOS F operations exacerbated with all project alternatives. From Cumulative No Project Conditions, the project would increase overall delay at this intersection by seven seconds under Cumulative No Action, 10 seconds under Cumulative Plus Alternative 1 and Cumulative Plus Alternative 2 Conditions, and by 12 seconds under Cumulative Plus Alternative 3 Conditions.
- *N Foothills Boulevard / Athens Avenue*: LOS F operations exacerbated with all project alternatives. From Cumulative No Project Conditions, the project would increase overall delay at this intersection by 26 seconds under Cumulative No Action Conditions, 37 seconds under Cumulative Plus Alternative 1 Conditions, 38 seconds under Cumulative Plus Alternative 2 Conditions, and 43 seconds under Cumulative Plus Alternative 3 Conditions.

Mitigation Measures: The following mitigation measures are recommended to restore operations to an acceptable level at each intersection:

- **Mitigation Measure TR-2a:** The project applicant shall pay their fair share cost of any capacity enhancing improvements identified by Placer County at the Cook Riolo Road / PFE Road intersection.

Placer County staff has indicated that the Dry Creek community does not desire a traffic signal at this location. No other planned improvements have been identified as part of the Dry Creek Community Plan. This mitigation requires the City of Roseville, on behalf of the project applicant, to negotiate in good faith with Placer County to identify the fair share funding contribution toward any capacity-enhancing improvements identified by the County for this intersection. Furthermore, since the type of improvement and its funding is not known, there is no assurance that the remaining funds necessary for construction will be collected. Therefore, the intersection impacts associated with this mitigation is considered **significant and unavoidable**.

- **Mitigation Measure TR-2b:** The project applicant shall pay their fair share cost of installing a traffic signal at the N Foothills Boulevard / Athens Avenue intersection.

Installation of a traffic signal at this intersection would restore operations to LOS A during the AM Peak Hour for all project alternatives under Cumulative Conditions. This improvement is not included in any known fee program. The mitigation requires the City of Roseville, on behalf of the project applicant, to negotiate in good faith with Placer County to identify the fair share funding contribution. Furthermore, since this improvement is not included in any currently adopted fee program, there is no assurance that remaining funds necessary for construction will be collected. Therefore, the intersection impacts associated with this mitigation is considered **significant and unavoidable**.

Impact TR-3 The project would cause the operations freeway facilities maintained by Caltrans to degrade by a significant degree under Cumulative Conditions. This is considered a significant impact.

The project would cause the following significant freeway facility degradations during the AM Peak Hour of Cumulative Conditions. This is considered a **significant impact**.

- SB SR 65 from Ferrari Ranch Road to Lincoln Boulevard: degrades from LOS E operations under Cumulative No Project Conditions to LOS F under Cumulative Plus Alternative 2 and Cumulative Plus Alternative 3 Conditions.

- SR 65 SB between Twelve Bridges Drive and Placer Parkway: degrades from LOS E under Cumulative No Project Conditions to LOS F under all project alternatives (Cumulative No Action, Cumulative Plus Alternative 1, Cumulative Plus Alternative 2, and Cumulative Plus Alternative 3 Conditions).

Mitigation Measure: The following mitigation measure is recommended to restore operations to an acceptable level of service at the freeway segment. This is the same finding as the *Final Traffic Study for the Amoruso Ranch Specific Plan*.

- **Mitigation Measure TR-3:** The project applicant shall pay the Highway 65 JPA Fee and the South Placer Regional Transportation Fee.

The Highway 65 JPA Fee assesses fees on new development for the cost of interchange improvements along SR 65. The SPRTA fee provides funding for regional projects such as the State Route 65 Widening, interchange improvements along I-80, and Placer Parkway.

Because the remaining funding necessary to widen SR 65 to six lanes from north of Whitney Ranch Parkway/Placer Parkway to Ferrari Ranch Road has not been identified, this impact is considered **significant and unavoidable**.

Appendix B

Trip Generation Technical Calculations

MIXED USE TRIP GENERATION MODEL - BASIC INPUT

All shaded cells are inputs
 Regular inputs (project-specific)
 Inputs that may depend on regional values from census data, travel demand model, etc...
 Treat like other inputs, but please send values and source to Mackenzie Watten so that a library of values can be compiled in future versions!

Section 1 - General Site Information

| | | | |
|--|---------------|--|-----|
| Site Name | Amoruso Ranch | Int/sq mi | 182 |
| Geographic | | | |
| Developed Area (in acres) | 436.74 | Notes / Instructions Include streets, ROW, parking lots, pocket parks. Do not include open space, vacant lots. | |
| Number of Intersections | 124 | Count intersections either within or on the perimeter of the MXD. Check resulting intersections per square mile in blue above | |
| Is Transit (bus or rail) present within the site or across the street? | No | Note: This is only used as a way to zero out the probability of external trips if no transit is present. | |
| Proportion of households within 1/4 mile of a transit stop | 0% | Enter as a percentage | |
| Land Use - Surrounding Area | | | |
| Is the site in a Central Business District and/or TOD? | No | Answering "Yes" will reduce the HBO and NHB purpose splits for retail use to those found in smaller stores. The nature of the stores (large vs. small) should be the primary factor in the selection here. | |
| Employment within one mile of the MXD | 0 | Do not include employment within the MXD itself | |
| Employment within a 30 minute Transit Trip (Door-to-door) | 0 | Include employment within the MXD itself | |
| Total Regional Employment | 966,900 | Employment at MPO or similar level | |
| Site Demographics | | | |
| Enter Population Directly? | No | If "No", will apply average HH size factors (immediately below) to dwelling unit totals in section 2 | |
| Use Surrounding Area (Block Group) Demographics for On-Site Average HH Size? | Yes | You do not need to enter population here. It will be calculated based on dwelling units below and average HH sizes. | |
| Use Surrounding Area (Block Group) Demographics for On-Site Average Veh Own? | Yes | If no project-specific information exists, can use block group average HH size (see below) | |
| Surrounding Area (Block Group) Demographics | | | |
| Average HH size near Site | 2.74 | See http://factfinder2.census.gov/ | |
| Average Vehicles Owned per Dwelling Unit near Site | 1.80 | See http://factfinder2.census.gov/ | |

MIXED USE TRIP GENERATION MODEL - BASIC INPUT

All shaded cells are inputs
Regular inputs (project-specific)
 Inputs that may depend on regional values from census data, travel demand model, etc...
 Treat like other inputs, but please send values and source to Mackenzie Watten so that a library of values can be compiled in future versions!

Section 1 - General Site Information

| | | | |
|--|-----------------------------|--|-----|
| Site Name | Amoruso Ranch Alternative 2 | int/sq mi | 182 |
| Geographic | | | |
| Developed Area (in acres) | 436.74 | Notes / Instructions Include streets, ROW, parking lots, pocket parks. Do not include open space, vacant lots. | |
| Number of Intersections | 124 | Count intersections either within or on the perimeter of the MXD. Check resulting intersections per square mile in blue above | |
| Is Transit (bus or rail) present within the site or across the street? | No | Note: This is only used as a way to zero out the probability of external trips if no transit is present. | |
| Proportion of households within 1/4 mile of a transit stop | 0% | Enter as a percentage | |
| Land Use - Surrounding Area | | | |
| Is the site in a Central Business District and/or TOD? | No | Answering "Yes" will reduce the HBO and NHB purpose splits for retail use to those found in smaller stores. The nature of the stores (large vs. small) should be the primary factor in the selection here. | |
| Employment within one mile of the MXD | 0 | Do not include employment within the MXD itself | |
| Employment within a 30 minute Transit Trip (Door-to-door) | 0 | Include employment within the MXD itself | |
| Total Regional Employment | 966,900 | Employment at MPO or similar level | |
| Site Demographics | | | |
| Enter Population Directly? | No | If "No", will apply average HH size factors (immediately below) to dwelling unit totals in section 2 | |
| Use Surrounding Area (Block Group) Demographics for On-Site Average HH Size? | Yes | You do not need to enter population here. It will be calculated based on dwelling units below and average HH sizes. | |
| Use Surrounding Area (Block Group) Demographics for On-Site Average Veh Own? | Yes | If no project-specific information exists, can use block group average HH size (see below) | |
| Surrounding Area (Block Group) Demographics | | | |
| Average HH size near Site | 2.74 | See http://factfinder2.census.gov/ | |
| Average Vehicles Owned per Dwelling Unit near Site | 1.80 | See http://factfinder2.census.gov/ | |
