In accordance with policy and regulation, the jeopardy analysis in this biological opinion relies on four components: (1) the *Status of the Species*, which evaluates the giant garter snake's and valley elderberry beetle's range-wide condition, the factors responsible for that condition, and their survival and recovery needs; (2) the *Environmental Baseline*, which evaluates the condition of the giant garter snake and valley elderberry longhorn beetle in the action area, the factors responsible for that condition, and the relationship of the action area to the survival and recovery of the valley elderberry beetle and giant garter snake; (3) the *Effects of the Action*, which determines the direct and indirect impacts of the proposed federal action and the effects of any interrelated or interdependent activities on the giant garter snake and valley elderberry beetle; and (4) the *Cumulative Effects*, which evaluates the effects of future, non-Federal activities in the action area on the giant garter snake and valley elderberry beetle.

In accordance with policy and regulation, the jeopardy determination is made by evaluating the effects of the proposed Federal action in the context of the giant garter snake's and valley elderberry beetle's current status, taking into account any cumulative effects, to determine if implementation of the proposed action is likely to cause an appreciable reduction in the likelihood of both the survival and recovery of the giant garter snake and valley elderberry beetle.

The jeopardy analysis in this biological opinion places an emphasis on consideration of the range-wide survival and recovery needs of the giant garter snake and valley elderberry beetle and the role of the action area in the survival and recovery of the giant garter snake and valley elderberry beetle as the context for evaluating the significance of the effects of the proposed Federal action, taken together with cumulative effects, for purposes of making the jeopardy determination.

Status of the Species
The status of the species for the giant garter snake and valley elderberry longhorn beetle are incorporated by reference from the programmatic biological opinion (pages 45-50 and 54-60).

Environmental Baseline
The environmental baseline for the giant garter snake and valley elderberry longhorn beetle are incorporated by reference from the programmatic biological opinion (page 50-54 and 61-62).

Effects of the Proposed Action

Giant garter snake

Direct Effects due to Phase 3 Construction

Phase 3 construction includes work along reaches 5A-9B along the Sacramento River east levee, PGCC west levee, NEMDC west levee, Elkhorn Canal, GGS/Canal, RD 1000 Pump Plant 2, and Airport West Ditch. Construction during this time would occur in 22.60 acres of developed land; 64.12 acres of annual grassland; 117.84 acres of row and field crop and fallow agriculture; 9.99 acres of orchard; 45.23 acres of rice; 14.66 acres of canals, ditches, and marsh; 12.74 acres of seasonal wetlands or riverine wetlands; and 35.34 acres of woodland (including 1.89 acres of Sacramento River riparian). At the end of construction for Phase 3 the proposed land cover types will be 6.09 acres of developed land; 33.61 acres of created woodland; 2.51 acres of preserved woodland; 266.32 acres grassland (primarily levee slope grassland and a small amount of grassland associated with the canals); and 16.67 acres of irrigation canals and ditches. The newly created cover-types from the project would be protected from future development through either a flood control easement, conservation easement, or drainage easement.

Components of Phase 3 work which would occur outside of the giant garter snake's active season include relocation of power poles; relocation of private irrigation pipelines, canals, and wells; the removal, transplantation, and/or planting of trees and elderberry shrubs that are located in the Phase 3 and 4 footprint; and construction of the lower GGS/Drainage Canal and the Elkhorn Canal. Giant garter snakes have been observed to overwinter as far as 250 meters from aquatic habitat. Given that giant garter snakes are generally inactive during the winter months SAFCA's working during the inactive season would kill giant garter snakes that may be overwintering within the construction footprint. To reduce disturbing and/or killing giant garter snakes that may be overwintering in uplands that would be affected this winter and construction would not begin prior to October 1, SAFCA has proposed to place exclusionary fencing erected prior to

October 1 in areas that may have overwintering giant garter snakes. The fencing would exclude giant garter snakes from entering the area where SAFCA would be constructing during the winter. This fence would be monitored daily prior to and during construction to insure that there are no breaches that a snake could get through. Areas that are unlikely to have overwintering giant garter snakes include areas which have active construction or agricultural activities occurring on them. The construction of the lower GGS/Drainage would begin after October 1, however the construction footprint is within active agriculture (alfalfa and row crop) which has been disturbed by typical agricultural practices and it is unlikely that giant garter snakes would use it for overwintering habitat. Effects likely due to this work being constructed during the inactive season includes crushing of snakes within their burrows and crushing snakes which are out of the burrow to bask or move short distances but are slower moving due to the temperature.

The remainder of the project would be constructed during the active period (May 1 – October 1) for the snake, resulting in a decreased risk of direct mortality of snakes and would be completed in one construction season, minimizing the length of the effects to snakes. Effects to snakes are highly likely given the number of acres affected within Phase 3. Effects would include removal of cover and basking sites and filling or crushing of burrows or crevices due to excavation activities. Snake movements would be obstructed due to construction activities blocking access to aquatic or upland habitat. The large amount of construction equipment and number of workers within the Phase 3 action area would increase the likelihood of running over basking or dispersing snakes. Filling in of aquatic habitat such as rice, marsh and ditches would decrease the prey base for giant garter snakes. All of these effects are likely to result in the direct disturbance, displacement, injury, and/or mortality of snakes. Some of these effects would be minimized through SAFCA's conservation measures. Much of the work would occur during the snake's active season which would reduce snake mortality because the snakes would be able to leave habitat that is undergoing construction. Dewatering habitat prior to working within in it by at least 2 weeks prior to disturbance would facilitate snakes leaving the construction areas. Speed limits along construction roads as well as worker awareness training should minimize vehicles running over basking or dispersing snakes. SAFCA has proposed to construct new canals and ditches prior to filling the existing ditches. This should allow both an area for the snakes to disperse to as well as help provide prey for snakes.

Compensation for the 45.23 acres of rice permanently converted to managed levee grassland in Phase 3 would occur by creating 45.23 acres of managed marsh during Phase 4 along the western boundary of Fisherman's Lake. The creation of managed marsh at this location would connect to existing TNBC Preserve lands which are currently managed marsh and would enlarge a core area for giant garter snakes in the Natomas Basin. While the Service recognizes the benefit of enlarging managed marsh within the Fisherman's Lake area, there would be a temporal loss of aquatic habitat for giant garter snakes between when rice is converted to upland in Phase 3 and when marsh is created in Phase 4.

SAFCA will be filling 9.25 acres of drainage ditches and marsh habitat. The majority of the acreage is due to the filling of the Airport West Drain. To compensate for the loss of habitat, SAFCA has proposed to build the GGS/Drainage Canal (while it will have some long-term

protections through a drainage easement, it will not be protected with a conservation easement) and to compensate with 9.25 acres of managed marsh with a conservation easement near Fisherman's Lake. There are about 5.93 acres of upland habitat that is associated with the ditches and marsh. Because the aquatic features are going to be filled, this area will no longer serve the same function of adjacent upland habitat for the giant garter snake. SAFCA will be creating and preserving a small amount of upland habitat adjacent to the GGS/Drainage Canal and also creating 5.93 acres of managed marsh with a conservation easement near Fisherman's Lake. The GGS/Drainage Canal will be sloped to minimize maintenance and will have the side slopes planted with perennial grasses along the upper slope and rushes and sedges along the water's edge. The new GGS/Drainage Canal would have a minimum water depth of 4.5 feet between April and October, which is the active season for the giant garter snake. Because snakes tend to overwinter near the water line of their aquatic habitat it is likely that snakes may overwinter along the GGS/Drainage Canal. Water level management of the GGS/Drainage Canal should prevent fluctuating water levels in the winter months which will avoid flooding upland habitat that giant garter snakes may use for overwintering.

SAFCA will be providing additional compensation lands at a 1:1 ratio of upland and aquatic habitat affected due to the filling of the Airport West Ditch in addition to creating the GGS/Drainage Canal. The GGS/Drainage Canal will only be protected with a drainage easement, not a conservation easement. Because the primary purpose of the easement will not be for conservation of the giant garter snake SAFCA has proposed to compensate 1:1 near Fisherman's Lake by creating managed marsh and placing a conservation easement over the property. Therefore, managed marsh created as compensation for Phase 3 will be built in Phase 4 and include 15.18 acres of compensation for canal and adjacent upland habitat effects. Phase 4 marsh creation at Fisherman's Lake will also include 25.35 acres of managed marsh due to habitat loss in Phase 2 and 45.23 acres of rice converted to grassland in Phase 3. SAFCA has committed to creating 100 acres of managed marsh at Fisherman's Lake during Phase 4.

Direct Effects due to Maintenance of GGS/Drainage Canal and Brookfield Rice

On-going maintenance activities will likely result in injury to and death of giant garter snakes. Sediment removal, vegetation removal, and canal bank repair of the GGS/Drainage Canal in the active season would involve the use of heavy machinery on the maintenance road. Giant garter snakes basking on the road could be run over by the large equipment. Snakes would also be harassed and would leave the construction area due to the human and construction activity. Snakes leaving the area would be subject to higher mortality due to predation. Maintenance activities may also fragment and isolate available habitat, prevent dispersal of giant garter snakes among habitat units, and reduce the availability of cover and giant garter snake prey.

Conservation measures proposed by SAFCA would minimize effects to giant garter snakes. Limiting the time of work, keeping heavy equipment on the maintenance road, using specialized equipment to protect the banks during sediment removal, dewatering the area prior to work beginning, the design of the canal, limiting the amount of rock placed for erosion protection, and worker awareness training would all minimize the likelihood of take of the giant garter snake

during canal maintenance. Work proposed between October 1 and May 1 would avoid disturbing the bank of the canal and vegetation along the edge of the canal, which should limit effects to overwintering snakes. Heavy equipment on the maintenance road would likely affect snakes which may be overwintering in nearby upland burrows or snakes which may take advantage of warm winter weather and may be out of a burrow foraging. However speed limits and worker awareness training would lessen the chances of snakes being run over by construction equipment. The above conservation measures should reduce these effects.

Grazing by small-hoofed animals has a low likelihood of injuring giant garter snakes and other species. Livestock move slowly through an area, providing time for giant garter snakes and other species to escape trampling. The small-hoofed animals cause minimal or no damage to giant garter snake burrows. Because mowing coincides with the giant garter snake active season, individuals present in upland habitat are likely to retreat to the water at the first sign of noise, vibration, and human activity, thereby reducing the chance of injury. Giant garter snakes could be injured or killed during prescribed burning activities if they are above ground, and in some cases, if their burrows become too hot. Burning of grasses and other ruderal vegetation typically proceeds quickly enough that harm to giant garter snakes in burrows or riprap is minimized.

The act of growing and harvesting rice could negatively affect giant garter snakes. Agricultural practices such as tilling, grading, harvesting, or mowing may kill or injure giant garter snakes. Giant garter snakes have been observed to overwinter near canals within or adjacent to rice fields making them especially vulnerable to earth moving activities required to shape flood irrigated fields, form rice checks (small berms that affect water flow) and install irrigation boxes (structures which regulate flow quantity). Growing of wild rice crops may result in more adverse effects than growing the more common long and short grain rice. Long and short grain rice are harvested after irrigation has ceased and fields have dried. Because radio-marked giant garter snakes have been observed moving from rice fields into the nearby canals as water recedes prior to harvest (Wylie 1998b), giant garter snakes are presumed to be absent when mechanical harvesters are driven into the fields. In contrast, wild rice is harvested while the field is inundated with water. The effects of mechanical harvesting upon giant garter snakes in fields with water and prey are present are unknown but, the harvesting is suspected to disrupt hunting, basking, or other behaviors.

Valley Elderberry Longhorn Beetle

Direct Effects due to Phase 3 Construction

Table 1 in the conservation measures above lists the elderberry shrub stem counts and sizes which would be transplanted as part of the Phase 3 construction. Elderberry shrubs would be transplanted and elderberry seedlings and associated natives would be planted within the portions of the woodland corridor that will be constructed in Phase 3. Valley elderberry longhorn beetle may be adversely affected with the transplantation of elderberry shrubs. Any beetle larvae occupying these plants are likely to be killed when the plants are transplanted. Loss of an elderberry shrub or even a stem can result in direct mortality of valley elderberry longhorn

beetles or affect valley elderberry longhorn breeding and feeding because adult beetles rely solely on elderberry flowers for food and must lay their eggs on elderberry stems to successfully reproduce.

Temporal loss of habitat will occur. Although mitigation for impacts on the beetle involve creation or restoration of habitat, it generally takes five or more years for elderberry plants to become large enough to support beetles, and it generally takes 25 years or longer for riparian habitats to reach their full value. Temporal loss of habitat will temporarily reduce the amount of habitat available to beetles and may cause fragmentation of habitat and isolation of subpopulations. Beetles disperse poorly and the systematic removal of elderberry shrubs from a relatively connected river corridor has adverse effects well outside of the project's footprint.

Cumulative Effects

The cumulative effects for the giant garter snake and valley elderberry longhorn beetle have not changed and are incorporated by reference from the amended programmatic biological opinion (pages 68-70).

Conclusion

After reviewing the current status of the giant garter snake and valley elderberry longhorn beetle, the environmental baseline for the species, the effects of the proposed project, and the cumulative effects on this species, it is the Service's biological opinion that the proposed Natomas Landside Improvements Project Phase 3, as described herein, is not likely to jeopardize the continued existence of the giant garter snake or valley elderberry longhorn beetle.

The Corps and SAFCA have proposed to improve flood protection for the Natomas Basin above what currently exists. Two HCPs currently exist within the Natomas Basin and are based on future development occurring within the permit area of the Metro Air Park Habitat Conservation Plan (MAPHCP) and NBHCP. The baselines and assumptions for which these HCPs were developed were based on no urban development occurring within the basin outside of these permit areas and landuse practices remaining essentially the same. Sacramento County and the City of Sacramento have been in discussions about additional development outside of the existing permit areas. As discussed in the Environmental Baseline, the Natomas Basin has experienced a large amount of rice fallowing both in land held by private farmers and leases terminated on Sacramento County Airport property. While the Service has concluded that SAFCA's project would not jeopardize the giant garter snake or valley elderberry longhorn beetle, it could enable future growth to occur that otherwise would not be allowable but for these actions, which would require additional analysis to determine if this growth could jeopardize any of the 22 species covered by the MAPHCP and NBHCP. However, although future growth in the Natomas Basin outside of the permit area is under discussion, the Service does not consider it to be reasonably foreseeable at this time, as no specific proposals are proposed or under review. If growth outside of the permit areas were to occur within the Natomas Basin, these future projects

must have a higher conservation outcome than currently exists in the HCPs and must be closely coordinated with the Service.

INCIDENTAL TAKE STATEMENT FOR PHASE 3 CONSTRUCTION

Section 9 of the Act and Federal regulation pursuant to section 4(d) of the Act prohibit the take of endangered and threatened species, respectively, without special exemption. Take is defined as harass, harm, pursue, hunt, shoot, wound, kill, trap, capture or collect, or to attempt to engage in any such conduct. Harass is defined by the Service as an intentional or negligent act or omission which creates the likelihood of injury to a listed species by annoying it to such an extent as to significantly disrupt normal behavioral patterns which include, but are not limited to, breeding, feeding or sheltering. Harm is defined by the Service to include significant habitat modification or degradation that results in death or injury to listed species by impairing behavioral patterns including breeding, feeding, or sheltering. Incidental take is defined as take that is incidental to, and not the purpose of, the carrying out of an otherwise lawful activity. Under the terms of section 7(b)(4) and section 7(o)(2), taking incidental to and not intended as part of the agency action is not considered to be prohibited taking under the Act, provided that such taking is in compliance with this Incidental Take Statement.

The measures described below are nondiscretionary for listed species in Phase 3 of this opinion and must be implemented by the Corps in order for the exemption in section 7(o)(2) to apply. The Corps has a continuing duty to regulate the activity that is covered by this incidental take statement. If the Federal agency (1) fails to adhere to the terms and conditions of the incidental take statement, and/or (2) fails to retain oversight to ensure compliance with these terms and conditions, the protective coverage of section 7(o)(2) may lapse.

Amount or Extent of Take

Giant Garter Snake

The Service anticipates that incidental take of the snake will be difficult to detect or quantify for the following reasons: giant garter snakes are cryptically colored, secretive, and known to be sensitive to human activities. Snakes may avoid detection by retreating to burrows, soil crevices, vegetation, or other cover. Individual snakes are difficult to detect unless they are observed, undisturbed, at a distance. Most close-range observations represent chance encounters that are difficult to predict. It is not possible to make an accurate estimate of the number of snakes that will be harassed, harmed or killed during Phase 3 construction activities (staging areas, work on canal banks, soil borrow areas, and vehicle traffic to and from borrow areas) or long-term maintenance of the GGS/Drainage Canal and Brookfield rice. In instances when take is difficult to detect, the Service may estimate take in numbers of species per acre of habitat lost or affected as a result of the action. Therefore, the Service anticipates that all giant garter snakes inhabiting 59.99 acres of aquatic and 73.81 acres of upland habitat may be harassed, harmed, or 3 giant garter snakes killed by loss and destruction of habitat due to construction of Phase 3. The Service also anticipates that all giant garter snakes inhabiting the 2.2-mile-long upper

GGS/Drainage Canal may be harmed, harassed, or 1 giant garter snake killed due to RD 1000 annual maintenance of the canal and adjacent uplands per year.

Valley Elderberry Longhorn Beetle

The Service expects that incidental take of the valley elderberry longhorn beetle will be difficult to detect or quantify. The cryptic nature of these species and their relatively small body size make the finding of an injured or dead specimen unlikely. The species occurs in habitats that make them difficult to detect. Due to the difficulty in quantifying the number of beetles that will be taken as a result of the proposed action, the Service is quantifying take incidental to the project as the number of elderberry stems one inch or greater in diameter at ground level (beetle habitat) that will become unsuitable for beetles due to direct or indirect effects as a result of Phase 3 construction. Therefore, the Service estimates that all beetles inhibiting 63 elderberry plants containing stems 1 inch or greater at ground level (165 stems between 1-3 inches, 50 stems between 3 and 5 inches and 50 stems $\geq$5 inches; see Table 1 in the text) will become unsuitable as a result of the proposed action.

Effect of the Take

The Service has determined that this level of anticipated take is not likely to result in jeopardy to the giant garter snake, or valley elderberry longhorn beetle, and will not result in the destruction or adverse modification of designated critical habitat because in the case of the giant garter snake critical habitat has not been designated and it is outside of the critical habitat for valley elderberry longhorn beetle.

Reasonable and Prudent Measures

The following Reasonable and Prudent Measures are necessary and appropriate to minimize the effect of the proposed project on the giant garter snake and valley elderberry longhorn beetle.

1. The Corps and SAFCA shall implement the project as proposed in the biological assessment and described in this biological opinion.

2. Effects of harassment of individual giant garter snakes within the proposed project, and of the loss or degradation of the species' habitat shall be minimized.

3. Effects of harassment of individual valley elderberry longhorn beetle, and of the loss and degradation of the species' habitat shall be minimized.

Terms and Conditions

In order to be exempt from the prohibitions of section 9 of the Act, the Corps must ensure compliance with the following terms and conditions, which implement the reasonable and prudent measures described above. These terms and conditions are nondiscretionary.

1. The following Terms and Conditions implement Reasonable and Prudent Measure one (1):

    a. The Corps and SAFCA shall minimize the potential for incidental take of the giant garter snake and valley elderberry longhorn beetle resulting from the project related activities by implementation of the project description as described in the biological assessment and the project description (pages 2 - 37) of this biological opinion.

    b. If requested, before, during, or upon completion of ground-breaking and construction activities, the project proponents shall allow access by Service and/or California Department of Fish and Game personnel to the project site to inspect the project for effects to giant garter snakes and valley elderberry longhorn beetles and to determine if the proposed conservation measures are being implemented.

    c. A Service-approved Worker Environmental Awareness Training Program for construction personnel shall be conducted by a Service-approved biologist for all construction workers prior to the commencement of construction activities. As needed, training shall be conducted in Spanish for Spanish language speakers and other languages as needed or necessary.

    d. The applicants shall include a copy of this biological opinion within its solicitations for design and construction of the proposed project making the primary contractor responsible for implementing all requirements and obligations included within the biological opinion, and to educate and inform all other contractors involved in the project as to the requirements of the biological opinion.

2. The following Terms and Conditions implement Reasonable and Prudent Measure two (2):

    a. At least 30 calendar days prior to initiating construction activities, the project proponents shall submit the names and curriculum vitae of the biological monitor(s) for the proposed project. Monitors shall have the ability to differentiate giant garter snakes from other snakes and the authority to stop construction activities if a snake is encountered during construction until appropriate corrective measures have been completed or until the snake is determined to be unharmed.

    b. For Phase 3 work that would occur outside of the giant garter snake active window, (power pole relocations, removal or relocation of residential or agricultural structures, construction of lower GGS/Drainage Canal and portions of Elkhorn Canal, and removal of trees and elderberry shrubs) exclusion fencing shall be placed around upland areas that giant garter snakes could use to overwinter. The exclusionary fencing shall be monitored everyday prior to and

during construction to ensure that openings do not develop that would allow the entry of a giant garter snake into the construction area.

c. If it appears that any other construction activity may go beyond October 1, the project proponents shall contact the Service as soon as possible, but not later than July 15 of the year in question, to determine if additional measures are necessary to minimize take. Areas that have not had ground breaking occur prior to September 15 shall not work past October 1.

d. The project proponents shall implement Best Management Practices to prevent sediment from entering areas containing snake habitat, including, but not limited to, silt fencing, temporary berms, no cleaning of equipment in or near snake habitat, installation of vegetative strips, and temporary sediment disposal.

e. Runoff from dust control and oil and other chemicals used in other construction activities shall be retained in the construction site and prevented from flowing into areas containing snake habitat. The runoff shall be retained in the construction areas by creating small earthen berms, installing silt fences or hay-bale dikes, or implementing other measures on the construction site to prevent runoff from entering the habitat of the snake.

f. The biologist shall notify the Service immediately if any listed species are found on-site, and will submit a report, including date(s), location(s), habitat description, and any corrective measures taken to protect the species found. The biologist shall be required to report any take to the Service immediately by telephone at (916) 414-6600 and by electronic mail or written letter addressed to the Division Chief, Endangered Species Program, within one (1) working day of the incident. The project area shall be re-inspected by the monitoring biologist whenever a lapse in construction activity of two weeks or greater has occurred.

g. To the extent feasible, the project proponents shall confine clearing of vegetation and scraping, or digging, of soil to the minimal area necessary to facilitate construction activities.

h. After completion of construction activities, any temporary fill and construction debris shall be removed. A written report regarding restoration of temporarily disturbed sites shall be submitted to the Service within ten (10) working days of the completion of construction at the project site.

i. The Corps and SAFCA shall ensure compliance with the reporting requirements.

j. Prior to commencement of construction on May 1, 2010, the Corps and SAFCA shall have the Phase 3 Mitigation and Monitoring Plan and Site Specific Management Plan completed and approved by the Service.

k. RD 1000 will include the number of giant garter snakes which are taken due to maintenance of the GGS/Drainage Canal in their annual report. Take should be recorded as actual number of snakes harmed, harassed, or killed, and the acreage of habitat affected. Once the incidental take coverage provided for within this biological opinion has been reached, RD 1000 may not conduct any further maintenance activities along the GGS/Drainage Canal for the remainder of the year without consulting with the Service.

l. If spoil from the GGS/Drainage Canal is to be placed on adjacent property during the inactive season (October 1 to May 1), the land should be either active row or orchard (they should have been farmed the previous year). Spoil should not be placed on agricultural fields which have been fallowed for one year or longer, or ruderal/grassland habitat as this may be habitat for overwintering snakes.

m. TNBC shall manage the Brookfield rice in concert with all of the preserves they manage for the NBHCP. Therefore, no more than 10 percent of TNBC managed rice shall be out of production in any given year.

3. The following Terms and Conditions implement Reasonable and Prudent Measure three (3):

a. The procedures outlined in the Service's *Conservation Guidelines for the Valley Elderberry Longhorn Beetle* dated July 9, 1999, shall be followed for all actions related to the proposed project.

b. A biological monitor will be present on site when work will encroach on the 20-foot elderberry buffer. The monitor will have the authority to stop construction within 20 feet of the shrub if unauthorized take of the beetle occurs. The monitor shall contact the Service immediately to determine what corrective measures need to be taken.

c. Compensation plantings shall occur within the same year as the transplantation of the elderberry shrubs.

Reporting Requirements

A post-construction compliance report prepared by the monitoring biologists must be submitted to the Deputy Assistant Field Supervisor at the Sacramento Fish and Wildlife Office within thirty (30) calendar days of the completion of construction activity or within thirty (30) calendar days of any break in construction activity lasting more than thirty (30) calendar days. This report shall detail: (i) dates that groundbreaking at the project started and the project was completed; (ii) pertinent information concerning the success of the project in meeting compensation and other conservation measures; (iii) an explanation of failure to meet such measures, if any; (iv) known

project effects on the giant garter snake and valley elderberry longhorn beetle, if any; (v) occurrences of incidental take of any these species; and (vi) other pertinent information.

The Corps must require SAFCA to report to the Service immediately any information about take or suspected take of federally-listed species not authorized in this biological opinion. SAFCA must notify the Service within 24 hours of receiving such information. Notification must include the date, time, and location of the incident or of the finding of a dead or injured animal. In the case of a dead animal, the individual animal should be preserved, as appropriate, and held in a secure location until instructions are received from the Service regarding the disposition of the specimen or the Service takes custody of the specimen. The Service contact persons are, Division Chief, Endangered Species Program at (916) 414-6600, and the Resident Agent-in-charge of the Service's Law Enforcement Division at (916) 414-6660.

Any contractor or employee who during routine operations and maintenance activities inadvertently kills or injures a listed wildlife species must immediately report the incident to their representative. This representative must contact the CDFG immediately in the case of a dead or injured listed species. The CDFG contact for immediate assistance is State Dispatch at (916) 445-0045.

CONSERVATION RECOMMENDATIONS

Section 7(a)(1) of Act directs Federal agencies to utilize their authorities to further the purposes of the Act by carrying out conservation programs for the benefit of endangered and threatened species. Conservation recommendations are discretionary agency activities that can be implemented to further the purposes of the Act, such as preservation of endangered species habitat, implementation of recovery actions, or development of information and data bases.

1. The Corps and SAFCA should assist in the implementation of the draft, and when published, the final Recovery Plan for the giant garter snake.

2. The Corps and SAFCA should provide funding to researchers studying topics identified by the Service in the draft, and when published, the final Recovery Plan for the giant garter snake.

3. The Corps should use environmental restoration authorities to acquire and restore garter snake habitat.

To be kept informed of actions minimizing or avoiding adverse effects or benefiting listed and proposed species or their habitats, the Service requests notification of the implementation of any conservation recommendations.

REINITIATION - CLOSING STATEMENT

This concludes formal consultation with the Corps on the Natomas Levee Improvement Project, Phase 3. As provided in 50 CFR 402.16, re-initiation of formal consultation is required where discretionary Federal agency involvement or control over the action has been maintained (or is authorized by law) and if: (1) the amount or extent of incidental take is exceeded; (2) new information reveals effects of the proposed action may affect listed species or critical habitat in a manner or to an extent not considered in this opinion; (3) the agency action is subsequently modified in a manner that causes an effect to listed species or critical habitat that was not considered in this opinion; or (4) a new species or critical habitat is designated that may be affected by the proposed action. In instances where the amount or extent of incidental take is exceeded, any operations causing such take must cease pending re-initiation.

If you have any questions regarding this biological opinion on the Natomas Landside Improvements Project Phase 3, please contact Jennifer Hobbs at (916) 414-6541 or Jana Affonso, Chief, Sacramento Valley Branch at (916) 414-6645.

Sincerely,

for Susan K. Moore
Field Supervisor

Subject: Phase 4a Section 7 Appendage to the Programmatic Biological Opinion for the Natomas Levee Improvement Program, Landside Improvements Project, Sacramento and Sutter Counties, California

Dear Ms. Kirchner:

This is in response to your February 3, 2010, request for formal consultation with the U.S. Fish and Wildlife Service (Service) on the Natomas Levee Improvement Program (NLIP), Landside Improvements Project Phase 4a (proposed project) in Sacramento and Sutter Counties, California. Your request was received on February 4, 2010. A programmatic biological opinion (BO) was completed on October 9, 2008 (File 81420-2008-F-0195-5), amended on April 6, 2009 (File 81420-2008-F-0195-R001), and amended again on October 2, 2009 (81420-2008-F-0195-R002). The programmatic BO analyzed the entire proposed project on the landscape level and because details of the project were only available for Phase 2, provided an incidental take statement for only that phase of the project. A BO for the Phase 3 portion of the project was completed on September 28, 2009, (File 81420-2009-F-0890) and amended on October 2, 2009 (File 81420-2009-F-0890-R001). This BO will examine the details of the Phase 4a portion of the project and the effects of the action to the federally-listed threatened giant garter snake (*Thamnophis gigas*) (GGS) in accordance with section 7 of the Endangered Species Act of 1973, as amended (16 U.S.C. 1531 *et seq.*) (Act). Critical habitat has not been designated for the GGS; therefore, none will be affected.

This BO is based on information provided in the U.S. Army Corps of Engineers' (Corps) letter requesting consultation and their biological assessment. A complete administrative record is on file at the Sacramento Fish and Wildlife Office.

CONSULTATION HISTORY FOR PHASE 4a

December 16, 2009. AECOM, the consultant to the Sacramento Area Flood Control Agency (SAFCA), provided the Service with an administrative draft Phase 4a biological assessment.

January 4, 2010. The Service e-mailed comments to AECOM on the draft Phase 4a biological assessment.

February 3, 2010. The Corps initiated section 7 consultation on Phase 4a.

BIOLOGICAL OPINION

Description of Action Area

The NLIP Landside Improvements Project consists of three phases of construction. Phase 2, which was discussed in more detail in the Programmatic and Phase 2 BA (SAFCA 2008a), will be implemented along the 5.3-milelong Natomas Cross Canal (NCC) south levee, the Sacramento River east levee from the NCC south levee to 2,000 feet south of the North Drainage Canal, the Elkhorn Main Irrigation Canal (Elkhorn Canal) between the North Drainage Canal and the Elkhorn Reservoir settling basin, the site of Reclamation District (RD) 1000 Pumping Plant No. 2, and adjacent land. Phase 3, which was discussed in more detail in the Phase 3 BA (SAFCA 2009a), will include the Sacramento River east levee south of the limits of the Phase 2 improvements to just south of Interstate 5 (I-5), the Pleasant Grove Creek Canal (PGCC) west levee, the Natomas East Main Drainage Canal (NEMDC) west levee between Elkhorn Boulevard and Northgate Boulevard, the area between Elkhorn Reservoir and the West Drainage Canal where a new GGS/Drainage Canal will be constructed, the Elkhorn Canal downstream of Elkhorn Reservoir, and RD 1000 Pumping Plant No. 2.

Phase 4a, which is the proposed project, will consist of:

- improvements to the Sacramento River east levee south of the limits of the Phase 3 improvements to approximately 2.5 miles north of Interstate 80,
- the relocation of the Riverside Main Irrigation Canal (Riverside Canal),
- creation of habitat in the vicinity of Fisherman's Lake, and
- improvements and modifications to a number of pumping plants along the Sacramento River east levee and NCC south levee.

Subsequent phases of the project may include improvements to the Sacramento River east levee south of the limits of the Phase 4a limits, the American River north levee, and the NEMDC west levee between Sankey Road and Elkhorn Boulevard and improvements to the West Drainage Canal from I-5 to Fisherman's Lake.

As greater flood protection will be provided for the entire Natomas Basin, the action area includes the entire Natomas Basin.

Description of Proposed Action

Overview of NLIP Landside Improvements Project

SAFCA is designing the NLIP in coordination with the Federal and state flood control project sponsors, the Corps, and the State of California Central Valley Flood Protection Board (CVFPB), to address the deficiencies in the Natomas levee system with a focus on achieving a 100-year level of flood protection by 2011. This will require improving the following landside conditions along the NCC south levee, the Sacramento River east levee, and the PGCC and NEMDC west levees:

- Inadequate freeboard—The NCC south levee and portions of the Sacramento River east levee are not high enough to provide at least 3 feet of freeboard above the 100-year water surface elevation. Additional reaches do not provide 3 feet of freeboard above the 200-year design water surface elevation.
- Underseepage and through-seepage vulnerability—Most of the levee reaches do not meet recently adopted Federal criteria for safely containing underseepage and through-seepage when the water surface in the adjacent channel reaches the 100-year elevation or, in some cases, the 200-year elevation.

The NLIP Landside Improvements project encompasses addressing freeboard deficiencies through levee raises; addressing seepage potential using a combination of seepage berms, cutoff walls, and relief wells; and acquiring additional right-of-way to construct the improvements and to prevent encroachment into the flood control system. In addition, the project has been designed to include an enlarged levee embankment (adjacent setback levee) along the land side of the existing Sacramento River east levee to minimize the need for substantial removal of vegetation and structural encroachments on the water side of this levee in compliance with Corps guidance. These improvements will include recontouring the levee slopes where necessary to provide a 3:1 horizontal-to-vertical (3H:1V) waterside slope and a 3H:1V (preferred) or 2H:1V (maximum) landside slope.

The specific goal of the NLIP Landside Improvements Project is to provide at least 100-year flood protection as quickly as possible while laying the groundwork to achieve at least urban-standard (200-year) flood protection over time.

Additional project objectives that influenced SAFCA's project design were to:

(1) use flood control projects in the vicinity of the Sacramento County Airport (Airport) to facilitate better management of Airport lands to reduce hazards to aviation safety, and

(2) use flood control projects to enhance habitat quality and values by increasing the extent and connectivity of the lands in the Natomas Basin being managed to provide habitat for the giant garter snake, the state-listed threatened Swainson's hawk (*Buteo swainsoni*), and other special-status species.

Recognizing the importance of securing maximum Federal support for the flood control project, SAFCA has explored implementation approaches that also advance the achievement of Federal aviation and wildlife protection objectives where complementary opportunities exist. Accordingly, the proposed project includes the following elements:

- The project will include construction of the GGS/Drainage Canal to provide giant garter snake habitat and some drainage infrastructure west of the Airport. Construction of these facilities will allow for dewatering of the ditch running along the western portion of the Airport runway system, which the airport recognizes as a flight safety hazard, by offsetting the effects on drainage and irrigation needs and giant garter snake habitat.

- The project will combine SAFCA's need for levee embankment and berm material with the Sacramento County Airport System's need to modify the condition and management of Airport bufferlands to reduce wildlife hazards affecting Airport operations in a manner that enhances the connectivity of areas managed specifically for their habitat value.

Levee Raising and Seepage Remediation

Sacramento River East Levee Reach 4B

Additional geotechnical analysis has determined that a cutoff wall is required in Reach 4B of the Sacramento River east levee. The 3-foot-wide soil-bentonite (SB) cutoff wall will be installed in the adjacent levee during the 2010 construction season. All construction will occur on the landside of the levee. Construction of the Reach 4B cutoff wall will involve degrading the new adjacent levee approximately 10 feet to create a working platform. The cutoff wall will be constructed from this working platform using a long-stick excavator, which will construct a continuous cutoff wall to depths ranging from approximately 20 to 75 feet. Once the cutoff wall is fully constructed and allowed to settle for at least 4 weeks, the adjacent levee embankment will be reconstructed and aggregate base/hydroseed will be placed on the surface.

Sacramento River East Levee Reaches 10–15

General Plan for Phase 4a Construction
Phase 4a construction on the Sacramento River east levee will include improvements from the northern end of Reach 10 through Reach 15, a distance of approximately 5.9 miles. Phase 4a Project work along the Sacramento River east levee includes:

- constructing an adjacent levee in Reaches 10-15;
- installing either SB or soil-cement-bentonite (SCB) through the existing levee or along the landside toe of the existing levee in Reaches 12A through 14;
- constructing 100- to 300-foot-wide seepage berms in Reaches 10 through a portion of 12A, part of Reach 14, and Reach 15 (Exhibit 6);
- installing relief wells, spaced at 60- to 100-foot intervals, approximately 20 feet beyond the toe of the seepage berm locations in Reaches 10, part of 11A, part of 14, and 15;

- establishing a 20- to 50-foot-wide operations and maintenance access corridor and a 20-foot-wide utility corridor adjacent to the toe of the adjacent levee or seepage berm;
- planting 50- to 200-foot-wide woodland groves in areas between Reaches 12A through 14;
- constructing new surface drainage inlets and outfalls along the Sacramento River east levee;
- reconstructing the Garden Highway intersections at Power Line Road, Radio Road, San Juan Road, and most private parcel ramps and RD 1000 facility access ramps; and
- acquiring parcel 225-0090-00, including vegetation clearing onsite.

The primary construction staging area will be located on approximately 1 acre near Power Line Road and the Garden Highway. At least three additional staging areas of about 1 acre each will be required along and at each end of the Riverside Canal alignment. These areas will be fenced and used for the contractor's and engineer's construction trailers, parking for personnel, machine maintenance tools and parts, possibly water trucks, and the storage of fuels and other materials to be used for construction. The project right-of-way along the construction area also will be used for staging of construction materials and equipment.

For this phase, the levee improvements are anticipated to be constructed between April 15 and November 1 of 2010 and 2011, with mobilization beginning April 15 and initial ground disturbance beginning May1. Some construction could extend as late as December 31. In areas within 200 feet of giant garter snake habitat, these areas will be continuously disturbed starting no later than the last two weeks of September. Some related activities, such as utility relocations; removal or relocations of residential or agricultural structures; and removal, transplantation, and planting of trees; will be conducted before April 15, though these will occur farther than 200 feet from suitable aquatic giant garter snake habitat. Demobilization and site restoration (e.g., hydroseeding, gravelling) will extend through January and these will occur within areas that have been continuously disturbed prior to the giant garter snake inactive period. Should additional construction activities occur outside of the specified work window for listed species, SAFCA will coordinate with the Corps, the Service, and DFG to implement additional avoidance and minimization measures as necessary and, if appropriate, will request that the Corps reinitiate section 7 consultation with the Service.

Site Preparation (Tree Removal, Clearing, Grubbing, and Stripping)

Site preparation will entail clearing structures and woody vegetation from the Phase 4a construction area (Reaches 12b through 15 and part of Reach 16 for the Riverside Canal) and stripping the top 12 inches of material from the landside slope of the existing levee and the footprint of the adjacent setback levee and seepage berm (as applicable). All vegetation in the operations and maintenance corridor within 15 feet of the levee toe or seepage berm will be cleared. However, outside of this 15-foot zone, trees within the utility and operations and maintenance corridors will be avoided where feasible. Where trees cannot be retained, the permanent maintenance access corridor will be cleared but not stripped. Large roots, tree stumps, root balls, deleterious material, and below ground infrastructure will then be grubbed from the working area. To the extent feasible, trees that must be removed from within the

footprint will be removed during the winter prior to the construction season to avoid disturbing the nesting behavior of special-status birds in spring. Excess earth materials (organic soils, roots, and grass from borrow areas and the adjacent levee foundation and excavated material that does not meet levee embankment criteria) will be respread on the surface of the new levee slopes and seepage berms, be used in the reclamation of borrow areas, or hauled off-site to landfills. Debris generated during the clearing and grubbing operations will be hauled off-site to landfills, concrete recycling plants or cogeneration facilities.

This footprint consists of the adjacent setback levee, a seepage berm, an operation and maintenance corridor, and a utility corridor, resulting in a total flood control footprint that ranges from approximately 127 to 465 feet wide. In addition, vegetation will also be removed in the footprint of the relocated Riverside Canal, which is directly adjacent to the landside edge of the flood control footprint. This operation will require removal of some trees and relocation/removal of elderberry shrubs, which occur mostly adjacent to existing roads. During winter, large trees will be felled approximately 3 feet above ground level, with stumps temporarily left in place. Logs will be cut into rounds for removal by contractors with handheld equipment and removed in light vehicles. Small trees and elderberry shrubs, where feasible, will be relocated to woodland preservation corridors or nodes that are part of the Phase 4a Project. A minimal amount of ground disturbance in specific areas will occur. During the giant garter snake active season (after May 1 and before October 1), the stumps will be removed and the footprint cleared and grubbed completely to prepare for construction. Vegetation clearing for Reaches 10–15 of the Sacramento River east was addressed in the Phase 3 BO.

Relocation and Removal of Landside Structures, Irrigation Ditches and Other Facilities

Approximately 12 residences and other farm structures that are within the footprint of the levee improvements will have to be removed or relocated farther from the flood control facilities before the start of levee construction in those areas. Irrigation facility conveyance features, distribution boxes, wells, and standpipes within the project footprint will be demolished and replaced as needed. Power poles that currently exist on the landside slope of the levee and at the landside levee toe will need to be relocated and/or rerouted to accommodate the widened levee footprint. To the extent feasible, mainline utility poles will be relocated beyond the landside levee toe or berms, and a secondary line of distribution poles will be relocated to the drainage swale area between the existing levee and the adjacent levee. Should placing poles on top of the seepage berms be required, either raised foundations or steel-reinforced concrete piers will be constructed to prevent the poles from affecting the seepage berms. Some poles may need to be relocated to the waterside of the existing levee. The relocations will be conducted in coordination with the utility companies and the construction operations. Tree pruning will likely be required in some locations to accommodate the poles and wires. Debris from structure demolition, power poles, utility lines, piping, and other materials requiring disposal will be hauled off-site to a suitable landfill. Wells and septic systems will be abandoned in accordance with the applicable State and county requirements.

Excavation of Stability Berm and Inspection Trench

The existing stability berm along the levee from Reaches 10 to 11B will be excavated and the fill material will be used in the construction of the seepage berms. The geotextile fabric from the berm's drain layer will be discarded to a suitable landfill. The rock from the stability berm's drainage layer will be either incorporated into the seepage berm, incorporated into other project features, or hauled off-site to landfills. The geotextile fabric from the berm's drainage layer will be hauled off-site to landfills.

Construction of Adjacent Levee, Cutoff Walls, and Seepage Berms

Borrow material from the borrow source will be delivered to the levee construction sites by scrapers or haul trucks where it will be spread by motor graders and compacted by sheepsfoot rollers to build the adjacent levee and seepage berms. In Reaches 10–12B, the levee will be raised to provide up to 2.3 feet of levee height above the 200-year design flood elevation. In Reaches 13–15, where the existing levee already meets height requirements, the top of the new levee will be no higher than the elevation of the existing levee crown. The landside slope of the adjacent levee will be 3H:1V (horizontal feet:vertical feet). In those areas where a cutoff wall is required, the adjacent levee will be built up a height approximately 5 feet above existing grade at the toe of the levee to create a working platform for cutoff wall installation. Three-foot wide cutoff walls made of either SB or SCB will be installed either through the existing levee or along the landside toe of the existing levee, with the top of the cutoff walls being at least 5 feet above existing ground surface and extending to a maximum depth of 110 feet below ground surface in some areas. Between Reaches 10 through the beginning of 12A and a portion of 14 through 15, borrow material will be spread and compacted for construction of the 100- to 300- foot-wide seepage berms.

Installation of Relief Wells and Monitoring Wells

Relief wells will be constructed at selected locations where the seepage berms cannot be wide enough or cutoff walls deep enough to meet the required seepage remediation design parameters. Relief wells will also be constructed along some of the entrance channels to the landside pump stations. Relief wells will be spaced at 50- to 100-foot intervals approximately 20 feet beyond the toe of the berm and will extend to depths of between 60 to 80 feet below the ground surface. Relief well surface discharge near the seepage berm toe will flow into new collection ditches or existing roadside ditches that will convey the water to Pumping Plant No. 5 or other parts of the interior drainage system.

Reconstruction of Garden Highway at Intersections

Where the cutoff wall will be constructed through the crown of the adjacent levee, reconstruction work on Garden Highway will be required to restore the landside lane of the roadway. Garden Highway intersections at Powerline Road, Radio Road, San Juan Road, multiple private parcel ramps, and RD 1000 facility access ramps will require reconstruction to accommodate the adjacent levee. It is anticipated that Garden Highway will be extended up and onto the widened

adjacent levee at these locations to meet with the secondary roads. Approach embankments at the intersections will be enlarged and the entire intersections will be repaved. Intersecting roadway embankments will be raised at and will be designed to meet Sacramento County roadway design criteria, typically extending the approach embankment approximately 600 feet outward from the adjacent levee. Traffic control measures and detours will be required during this phase of construction.

Installation of Surface Drainage Outlets Across Garden Highway

Upstream of Reach 15 of the Sacramento River east levee, the portion of levee between the new adjacent setback levee and the Garden Highway pavement will include new storm drainage collection facilities to convey surface water beneath Garden Highway and toward the Sacramento River. These drainage facilities will be necessary only in areas where the adjacent levee is higher than Garden Highway or during the transition back to the nonraised adjacent levee. A surface collection system (grassed drainage swale) will convey runoff water to drop inlets, and new pipe laterals will convey the water beneath Garden Highway to new waterside outfalls, spaced approximately 1,500 feet apart, in the berm along the east bank of the Sacramento River (Exhibit 7a). In most locations, the outfalls will be placed above the ordinary high water mark on the 'bench' adjacent to the levee. The location of the cross culverts will be selected to minimize impacts on existing residential properties and riparian vegetation, including trees. The drainage pipes vary from 12 to 30 inches diameter. The discharge will vary with the magnitude of precipitation events and is anticipated to exceed 1 cubic foot per second (cfs) during substantial rain events. These discharge pipes will require minor landscape improvements to prevent erosion and ensure that applicable water quality standards are met. Rock slope protection will be installed on the surface of the 'bench' to prevent erosion below the outfalls. Excavation of a trench to install the culvert piping across Garden Highway will be required, and those segments where excavation occurs will have to be reconstructed. Single-lane traffic controls and through-traffic detours will be required during this phase of construction. No waterside outlets will be required in Reach 13, 14, and 15 because the new adjacent levee will not be raised above the existing levee or because the transition from the raised levee to the existing levee height will end at a point where runoff from Garden Highway in this reach could continue to drain to both the landside and waterside of the levee as it does now.

Upon completion of construction activities, the levee slopes and the tops of the seepage berms will be hydroseeded. An aggregate base patrol road will be constructed on the crown of the new levee and on the landside edge of the seepage berm. Any construction debris will be hauled to an appropriate waste facility. Equipment and materials will be removed from the site, and staging areas and any temporary access roads will be restored to pre-project conditions. Demobilization will likely occur in various locations as construction proceeds along the project alignment.

Natomas Cross Canal South Levee

At the Natomas Central Mutual Water Company's (NCMWC) pumping plants along the NCC south levee, discharge pipelines penetrate the NCC south levee at an elevation lower than the 200-year design flood elevation and must be raised or removed to comply with current levee

design criteria. One 36-inch-diameter pipe and one 42-inch-diameter pipe are located at the Bennett Pumping Plant; three 30-inch-diameter and two 42-inch-diameter pipelines are located at the Northern Pumping Plant.

The demolition of the Northern and Bennett Pumping Plants and the removal of the intake pipes are part of the American Basin Fish Screen and Habitat Improvement Project (ABFS), which will include a replacement pumping facility on the Sacramento River, near the Garden Highway and Sankey Road intersection. Timing and extent of construction at these sites under the NLIP is dependent upon the following two scenarios:

1. If construction of the ABFS is completed first, the demolition of the plants will be completed and the pipes beneath the levee can be removed as needed to install the cutoff wall.

2. If the ABFS is not completed first, the cutoff wall will be installed along the NCC south levee and the pipes will be raised and the pumps and motors will be modified so that these plants can continue to operate. Then, once the ABFS project is constructed and operational, the pipes and pumps will be removed.

General Plan for Phase 4a Construction

The Bennett Pumping Plant gap is located between Stations 56+00 and 61+00 of the NCC, and the Northern Main Pumping Plant gap is located between Stations 188+50 and 122+10 of the NCC. Once the issues with the discharge pipes are resolved, cutoff walls will be installed up to 80 feet deep at the pumping plant locations to close gaps that will remain along the cutoff wall following construction of the Phase 1B and Phase 2 Projects. The levee will also be raised at these locations to an elevation equal to at least 3 feet above the 200-year design flood elevation, and the levee side slopes will be flattened to meet current design criteria.

Cutoff Wall Construction

At the pumping plant locations, including overlaps, a total length of 1,050 lineal feet (73,500 square feet) of cutoff wall will be constructed. Cutoff wall installation at the pumping plant locations will include the mobilization of a long reach excavator, levee degrading equipment, and slurry production equipment. The levee will be degraded to one-half the levee height, as measured from the landside toe, and existing pumping plant pipes will be removed. At the Bennett Pumping Plant, where a 42-inch-diameter pipe is located deeper in the levee (approximately 20 feet beneath the existing crown), the levee will be further degraded to the base of the pipe and the pipe removed. The levee will then be reconstructed to one-half the levee height to support cutoff wall construction. A cutoff wall will be constructed along the existing levee centerline, overlapping the previously constructed cutoff walls adjacent to the pumping plants by a minimum of 50 feet. After allowing the cutoff wall approximately 3 weeks to consolidate, the levee reconstruction will begin, as discussed below.

Levee Raising

Levee raising will be carried out in a manner similar to the work completed on the NCC as part of the Phase 2 Project. To obtain 3 feet of levee height above the 200-year design water surface, these levee sections will be raised approximately 3 feet. At the Bennett Pump Plant, where additional levee degrading is required to remove a deeper pipeline, the levee will be constructed to a 3H:1V waterside slope, aligning with the portions of levee constructed adjacent to this reach as part of the Phase 2 Project. Given the landward setback of the Phase 2 Project construction, this slope configuration will provide a 3H:1V theoretical slope from the toe to top of the waterside slope. At the Northern Pump Plant, where it is not necessary to degrade the levee beyond one half the levee height, the crown will be reconstructed from the point of degrade up at a slope of 3H:1V. Landside slopes at both locations will be constructed at 3H:1V. The Brookfield borrow site will be the most likely source for import material.

Major Irrigation and Drainage Infrastructure Modifications

Riverside Canal Realignment

The 18,600-foot Riverside Canal is a main irrigation canal that services the NCMWC's riverside system. The canal flows south along the landside toe of the levee from RD 1000 Pumping Plant No. 3 at the beginning of Reach 13 to Bryte Bend Road at the end of Reach 17, beyond which the canal is abandoned. The canal is lined with concrete for most of its length, although the concrete is broken in many areas allowing vegetation to grow along the bank. During Phase 4a, the Riverside Canal will be relocated and reconstructed several hundred feet east of the landside toe of the Sacramento River east levee (Reaches 13–15) to accommodate the levee improvements as well as extended up to Reach 11B. The total length of relocated canal to be constructed in Phase 4a is 14,940 feet.

Timing of the new Riverside Canal construction will be critical to avoid interruptions in irrigation service. Temporary connections may need to be constructed to avoid agricultural service interruptions to adjacent properties. The construction of the Riverside Canal will occur in advance of the abandonment and filling of the existing Riverside Canal by the levee improvements. Extension of the Riverside Pumping Plant pipes to provide water to the new canal and turnout connections to users will be constructed outside of the irrigation season so as to avoid service interruptions.

Canal Alignment

The proposed alignment of the replacement Riverside Canal is based primarily on the extent of the planned levee improvements. Much of the replacement canal will be sited as close as possible to the toe of the new levee and seepage berm footprint. One-half to three-quarters of a mile south of San Juan Road southward to Interstate 80 (I-80), there are a number of residences along the landside toe of the levee. To avoid removing a significant number of the residential and agricultural structures on these private properties, the new Riverside Canal alignment will follow the eastern property line of these parcels, veering farther east in Reach 16. The final

alignment will also strive to avoid existing trees and other site-specific constraints that are identified during final design. Based on these site-specific factors and the variation of the proposed seepage remediation methods in different reaches, the alignment will be only roughly parallel to the projected levee toe.

The bottom of the canal, which will be approximately 8 to 10 feet wide, will be high enough to raise irrigation water levels above the levels of adjacent fields so that these fields could be fed by gravity flow. The canal will be confined by approximately 5.5-foot-high earthen embankments designed to provide 1 foot of levee height above irrigation water operating levels. To provide for stable banks, the side slopes of the canal will be 3H:1V or flatter. Between Reach 11B and mid-Reach 14 the invert and side slopes of the canal will be earthen. Between mid-Reach 14 and Reach 17 the invert and side slopes of the canal will be lined with concrete for control of vegetation and to allow for canal maintenance with minimal disturbance of aquatic habitat along the water's edge. If lined, the interior side slopes of the canal could be steepened up to a configuration of 2H:1V, possibly resulting in a slightly narrower footprint. The tops of the embankments will be approximately 12 feet wide, with a patrol road with an aggregate based rock surface located on top of the each of the embankments. The total canal right-of-way will be roughly 155 feet wide, including a landside operation and maintenance corridor.

Canal and Pipeline Construction

Clearing and Grubbing/Stripping

Prior to construction, the canal right-of-way surface will be cleared and stripped to a depth of 4 to 6 inches, with removal of low-growing vegetation and loose surface soils. Additional overexcavation up to 3 feet deep may be required if materials not suitable for embankment foundations are encountered. Earthen materials removed during this stage will be stockpiled for reuse in embankments, topsoil respread, or adjacent berm construction. Non-earthen materials that are not suitable for reuse in embankments will be wasted and hauled off-site. Prior to any excavation, power poles in the path of the canal construction will be relocated. Natural gas pipelines, gas wells, and other gas facilities will be avoided or reconfigured in design of the new Riverside Canal.

Embankment and Pipeline Construction

Up to 400,000 cubic yards of material required to construct the embankments of the new Riverside Canal will come primarily from the borrow sites around Fisherman's Lake. Concrete-lined sections of the canal will utilize boom trucks and concrete pumps to apply the concrete to the bottom and sides of the channel.

Pipe sections will be constructed by excavating open trenches, laying the pipe, and backfilling to provide adequate cover material. Pipeline construction will likely occur in conjunction with construction of the open channel portion of the new Riverside Canal. This will facilitate operational changes and avoid potential service interruptions by temporarily creating a redundant system, because construction will occur while the existing Riverside Canal is still operational.

However, because levee improvements south of Reach 15 (approximately the north end of the pipeline) will be constructed as part of the Phase 4b Project, it is possible that pipeline construction will be delayed and included in the contract for Phase 4b Project levee improvements. In that case, a temporary connection will be constructed from the relocated and extended Riverside Canal to the existing Riverside Canal to provide interim irrigation service to the parcels that will eventually be served by the pipeline. If the Phase 4b Project is not built, the interim pipeline connection will remain to serve irrigated agricultural fields south of Reach 15. For the quantitative analysis of impacts associated with the relocated canal, it was assumed that the area within the canal footprint will include the anticipated water surface area for the canal and two 12-foot-wide roads (one on each embankment). It was assumed the remainder of the land in the project footprint will be converted to managed grassland. However, these calculations did not account for the geometry of canal slopes and therefore underestimate the total amount of bank land cover associated with the canal.

Water Control Facility Construction

Approximately 40 field services (water turnout points), roadway crossings, and diversion boxes are located along the canal. The turnouts, roadway crossings, and diversion boxes will need to be replaced as part of the proposed project. New facilities that will be constructed include distribution boxes, gate valves, cast-in-place concrete headwalls and control structures, and culverts. Backhoes and excavators will be used to excavate material for the new facilities. Precast distribution boxes, pipes, and other appurtenances will be transported to the site on trucks. Other concrete facilities will be cast in place and concrete will be transported to the site in ready-mix trucks. Small compactors will be used to compact fill material around the facilities. Portions of farm canals and other irrigation canals will be abandoned because of the relocation of the Riverside Canal. Canal segments that are outside the footprint of the proposed levee improvements will be filled after the relocation of the Riverside Canal is completed.

Erosion Control and Demobilization/Cleanup

Erosion control measures will be installed prior to the start of construction and maintained throughout the duration of the construction to minimize sedimentation of adjacent waterways. A hydroseeding truck will be used at the end of the construction to seed any disturbed area. Water trucks will be used throughout the construction to control dust in any disturbed areas. Following construction, all disturbed areas will be vegetated and the construction site will be generally cleaned up including hauling off unused and waste materials. All construction equipment will be taken off-site.

Modification to Pumping Plants

Riverside Pumping Plant Modifications

The NCMWC Riverside Pumping Plant's pump discharge pipes, which currently penetrate the Sacramento River east levee (Reach 14) below the 200-year design flood elevation, will be raised to cross the levee above this elevation. The existing pumps will require modification or

replacement to achieve pre-project performance after the levee improvements and pipe raising. The building superstructure that supports the pumps at the Riverside Pumping Plant will require retrofitting or other rehabilitation to accommodate the replacement pipes. The pump house, manifold structures, gate boxes, and outfall will be removed or modified for replacement of discharge pipes. Some excavation of sediments within the Sacramento River channel may be required for installation of the new pumps. In-water construction will include use of dredge pumps to remove sediment so that new pumps could be installed, but no dewatering involving use of a cofferdam will take place. Use of a backhoe, pneumatic hammers, and a front-end loader and haul truck will likely be required to remove the pump discharge manifold structure, the pump house, and the gate structures. The material will be removed from the site or salvaged and returned to NCMWC. For modifications to the pumps, the pumps will be removed from the platform and replaced with new pumps. Temporary pipes will be installed under Garden Highway at the Riverside Pumping Plant concurrent with cutoff wall construction. In the following construction year, permanent pipes will be installed after the levee has settled.

The existing design capacity of the Riverside Canal is 45 cfs. The capacity of the modified Riverside Pumping Plant will not increase as part of the pump consolidation efforts. This is because of a reduction in the Riverside Canal's service area. Irrigation-water service to the areas north and south of I-80 and San Juan Road was decreased as a direct result of urban development in these areas. Irrigation water will also be provided from the Riverside Canal system to the Novak site which will be managed for Swainson's hawk foraging habitat. Similar to the Northern and Bennett Pumping Plant locations described above under the NCC south levee improvements work, the retrofitting of the Riverside Pumping Plant and the removal and screening of the intake pipes are part of the ABFS, which will include a replacement pumping facility on the Sacramento River, near the intersection of Garden Highway and Sankey Road.

Timing and the extent of construction at this site under the NLIP is dependent upon the following two scenarios:

1. If construction of the ABFS is completed first, the demolition of the plant will be completed and the pipes across the levee will be removed as needed to implement seepage remediation measures.

2. If the ABFS is not completed first, the seepage remediation measures will be implemented along the Sacramento River east levee, and the pipes will be raised and the pumps and motors will be modified as necessary so that this plant can continue to operate. Then, as part of the ABFS project, the pipes and pumps will be removed and replacement (screened) facilities constructed.

Modifications or Relocations of Pumping Plant Nos. 3 and 5

The existing discharge pipes at RD 1000's Pumping Plant Nos. 3 and 5 will be raised to cross the levee above the new "200-year" design flood elevation. Both pumping plants will require new discharge pipes and some additional modifications to accommodate the new criteria and levee improvements. The existing pumps will require modification or replacement to allow similar

performance after the levee improvements and pipe raising. To mitigate for levee underseepage potential, relief wells and channel modifications to the pumping plant intake channels will be required. As design evaluations continue and the design is refined, additional modifications could be required to maintain the plant's current operations, such as adding relief wells and lining the intake channel with either filter gravel or rock-covered geotextile fabric. In addition, relocating the pump stations may be necessary to accommodate the adjacent levee footprint. Temporary pipes will be installed under Garden Highway at Pumping Plant Nos. 3 and 5 concurrent with cutoff wall construction. In the following construction year, permanent pipes will be installed after the levee has settled.

Pumping Plant No. 5

Pumping Plant No. 5 is located in Reach 10 of the Sacramento River east levee. An excavated intake channel is located adjacent to the levee and connected to the West Drainage Canal on the east end, and three pumps and an equipment building are located immediately adjacent to the landside levee toe. Each pump connects to a buried discharge pipe that runs across the existing levee to an outfall structure on the Sacramento River. Three air/siphon release valves, one for each pipe, are located close to Garden Highway on the waterside of the levee.

Modifications will include replacing the discharge pipes that extend from this pumping plant across the levee to tie into the existing discharge pipes within the waterside bench. These modifications will take place above the Sacramento River's normal water surface elevations; therefore, no dewatering will occur. The air/siphon release valves will be replaced and shutoff valves will be added. The valves will be constructed in a concrete vault in the waterside shoulder of the levee. The pumps will also be replaced and/or upgraded to account for the higher head associated with the raised discharge pipes.

To facilitate raising of the pump discharge pipes, Garden Highway will require a local raise in grade over the pipes. The road raise will transition back down to existing grade upstream and downstream of the local raise. This work will require partial regrading of the waterside slope for the 1,200-foot length of the raised Garden Highway in Reach 10. The levee will transition upstream and downstream of this site from an adjacent levee to a raise of the existing levee in place. The levee at this site will require degrade and reconstruction with engineered fill.

This pump station will need to be relocated as a seepage and stability mitigation measure. The pump station will be moved approximately 300 feet away from the levee along the existing intake canal. The intake channel between the existing and new pump station sites will be filled. The reconstructed Pumping Plant No. 5 will consist of a cast-in-place concrete sump, with a trash rack and operating deck. An enclosure building will be provided to house the electrical, control, and monitoring equipment. The pumps, electrical equipment, maintenance platform, and pump deck will be elevated above the Natomas Basin's interior 100-year flood elevation. Access roads will be reconstructed to allow access to the relocated pump station. Related infrastructure, such as access roads and utilities that serve Pumping Plant No. 5 and are located within the levee footprint, will be relocated outside the footprint.

Pumping Plant No. 3

Pumping Plant No. 3 is located along Reach 13 of the Sacramento River east levee. Four pumps, a water vault, a control-room building, and associated infrastructure for the pumping plant are located immediately adjacent to the landside levee toe. Three of the pumps are connected to a concrete pressure vault and discharge into a single deep culvert under the levee with an outfall into the Sacramento River. The other pump is directly connected to a discharge pipe to the river and crosses through the levee high in the levee section, under Garden Highway. A spare discharge pipe also crosses through the levee high in the levee section. These two pipes are discharged into a concrete outfall structure built into the bank of the river.

The scope of the modifications required at Pumping Plant No. 3 will be similar to those described for Pumping Plant No. 5, in that the pipe across the levee will need to be raised and replaced. The extended pipe will tie into existing discharge pipes within the waterside bench. The modifications to Pumping Plant No. 3 will also include relocating and replacing the water vault. The new water vault and outlet pipe will likely be located on the waterside bench to tie into the existing outlet pipes at that location. These modifications will take place above the Sacramento River's normal water surface elevations; therefore, no dewatering will occur.

To comply with current levee construction standards, removal of the deep culvert at this site will be required. Removal of the culvert will require a deep excavation and dewatering, which will be accomplished by installation of a sheetpile cofferdam in the Sacramento River. Dewatering will be accomplished through the use of sheetpiling and pumping. In addition to pumping from behind the cofferdam, temporary holes with pumps will be installed around the perimeter of the area to be dewatered to lower the groundwater. Groundwater pumping will be discharged into the drainage canal upstream of Pumping Plant No. 3 or other surface canals in the area, such as the Riverside Irrigation Canal. Discharge into the Sacramento River will also be considered, provided water can be routed through silt settling basins to provide suitable water quality. The three Pumping Plant No. 3 pumps which discharge through this deep culvert will be reconfigured to pump into individual discharge pipes. These pipes will cross through high in the levee section, similar to the other pumps. A new concrete outfall will be constructed in the bank of the river, similar to the existing concrete outfall for other pumps. The new outfall will likely replace the existing with a larger outfall for all five pipes to minimize the footprint. This construction will take place behind the cofferdam that will be installed to remove the existing deep culvert. The concrete outfall will be constructed with the cofferdam, and the dam will be cut off flush with the outfall invert when complete. Rock will be placed around the outfall and down the slope to stabilize the area around the outfall. New pumps could require the excavation of a deeper sump, which may require some excavation of and modification to the Pumping Plant No. 3 drainage canal. Similar seepage and mitigation measures will be performed in the intake channel to 300–400 feet upstream of the pump entrance. Modifications will include a combination of installing relief wells, flattening the slopes of the channel banks, and lining the channel with a gravel or geotextile filter layer covered with rock. Related infrastructure, such as access roads and utilities that serve the pumping plant and are located within the levee footprint, will be relocated outside the footprint.

South Lauppe Pump Replacement

The Corps and the CVFPB have approved a bank protection project, under Corps' larger Sacramento River Bank Protection Project, to repair five erosion sites in the Sacramento River watershed, including a 1-acre, site at River Mile 77.2 on the left bank of the Sacramento River in Sutter County. The bank protection project will install rock slope protection at this site, which will require reconstruction of the existing South Lauppe vertical river pump. The Phase 4a Project addresses the impacts of reconstruction of the pump. This facility is operated by a private landowner and serves approximately 200 acres of farmland, including the Natomas Basin Conservancy's (TNBC) Huffman West Preserve. The pumping plant irrigates the above farmland in conjunction with an existing groundwater well. Operational conditions will essentially remain unchanged.

The existing platform and vertical pump will be replaced by a new pile supported platform and slant pump. A steel operating deck will be constructed on the bench near top of bank, approximately 20 feet landside of the existing platform. Pairs of steel H-piles to support the slant pump will be driven every 20 feet from the new platform to 75 feet beyond the existing platform, a distance of approximately 120 feet. Pump supports and operating deck columns above the waterline could also be supported with concrete foundations.

Reconstruction of the new South Lauppe River Pump will occur following completion of the bank protection project. However, the existing pump, motor, electrical, and steel platform (including vertical supports) and discharge pipes will be removed to facilitate the bank protection project. The removal will require a system outage until the replacement facility can be constructed, which will be accomplished through reliance upon alternative delivery facilities, such as the groundwater well, and changes in cropping. The existing concrete abutments for platform posts will be left in place to support the new pump. Removal of the pump will not require dewatering, and the only activities below the ordinary high water mark will be cutting off steel supports and lifting the pump out of the river using a crane from the top of bank.

After installation of the rock, as part of the proposed project, steel H-piles will be driven using a crane and impact hammer. Because some of the supports are located within the rock protection area, coordination with the Corps will be required to provide space for the new H-piles. During the rock placement, the Corps could leave voids in the rock for the H-piles, or during the H-pile installation, the existing rock could be pulled back for the pile installation and replaced following installation. Rock placed below the water surface could be moved and replaced using equipment from the top of bank and divers to avoid dewatering. Concrete foundations could be used to support the pump support columns above the waterline.

Once the supports are installed, the new steel platform will be constructed and connected to the new piles. The new slant pump will be installed and connected to the H-piles. New controls and electric service will be provided. The construction also includes a new discharge pipe to connect to the existing discharge pipe. Some limited excavation may be required for placement of footings (less than 50 square feet) above the waterline, but below the ordinary high water mark and on the bench. This construction activity will take place from the top of bank and the only

work below the ordinary high water mark will be welding of steel supports and lifting the new pump into place. Estimated permanent fill will be less than 50 square feet for each site.

An alternative to modifying the existing South Lauppe River Pump will be to relocate the facility to the north such that it will be outside of the planned rock slope protection area. The facility will be relocated in kind with a steel platform and vertical pump. Some in water pile driving will be required for this option as well. The overall footprint for the platform and pump will be much smaller, approximately half the length of the slant pump footprint, thus requiring much less in water work. This alternative will also require a 300-foot, 16-inch-diameter pipeline to connect the new river pump to the existing irrigation system landside of the existing pump.

Other Private Pump Replacements

Nine additional private river pumps will require pipe raising and motor and pump upgrades in order to be compatible with the proposed levee improvements and to meet current levee standards. For all pumps, discharge pipes will be raised above the 200-year design flood elevation to comply with current levee standards. The locations of the private river pumps are as follows NCC south levee:

- Odysseus private river pump is located near the confluence with the Sacramento River;

Sacramento River east levee:

- Cummings private river pump is located in Reach 1,
- North Lauppe pump is located in Reach 2,
- Siddiqui and Hewitt private river pumps are located in Reach 11A,
- three Airport river pumps are located in Reach 11B, and
- SAFCA pump for the Novak property is located in Reach 12A.

Odysseus, Cummings, and North Lauppe modified pipe configurations will require upgrades to the pump motors and pump bowls. The capacity of the facilities will be unchanged, but the higher pumping levels will require more power input to maintain existing capacity. These modifications will be constructed in winter 2010 and 2011, during the non-irrigation season, and will be completed by April 1, 2011 to minimize irrigation service disruptions. The pumping facility rehabilitation will require removal and replacement of existing pumps using a crane from the bench area above the top of the NCC and Sacramento River bank. A barge could also be employed for removal and replacement of pumps. Motor upgrades will most likely require an upgrade of electrical equipment, as well as overhead electrical service. New conduits from the power pole to the platform will be constructed by open trenching. New power poles and guy wires could also be required. Steel members on the pumping plant superstructure may be replaced or upgraded on existing foundations. Where foundations are inadequate, additional and/or replacement supports will be constructed. Minor vegetation trimming and/or clearing may be required.

At the Odysseus Pump, cast-in-place concrete drilled piers or slab foundations will be constructed. New steel H-piles will be driven to support the pump and platform upgrades at the Cummings Pump in the Sacramento River east levee Reach 1. To remove and reinstall the pumps, some localized minor maintenance dredging under the pump house may be required to clear sediment buildup, if any, around the pump bowls. Dredging will be performed by divers with dredging hoses. The sites will generally be accessed off of the adjacent NCC levee patrol road and Garden Highway, along existing access roads. No dewatering will be required. Work within the NCC and Sacramento River will be limited to removal and replacement of pumps by crane and any required repairs to steel pump platform superstructure. No fill placement or bank hardening is anticipated. Upon completion, disturbed overbank areas will be restored with native seed mix.

At the Siddiqui pump, Hewitt pump, the three Airport river pumps, and SAFCA pump for the Novak property, existing discharge pipes will be extended landward through the new levee footprint to adjacent agricultural fields and will be reconnected to irrigation distribution systems (pipes and/or ditches to match existing) that will be relocated to make room for the expanded levee footprint.

For waterside pipe replacement, vegetation will be avoided to the extent feasible, but generally an approximately 15-foot-wide corridor will be required for excavation, removal, and replacement of pipes. The modified pipe configuration will require upgrades to the pump motors and pump bowls. The capacity of the facilities will be unchanged, but the higher pumping levels will require more power input to maintain existing pumping capacity. The pumping facility rehabilitation will require removal and replacement of existing pumps using a crane from the bench area above the top of the Sacramento River bank. A barge could also be employed for removal and replacement of pumps. Motor upgrades will most likely require upgrade of electrical equipment, as well as overhead electrical service. New conduits from power poles to platforms will be constructed by open trenching. New power poles and guy wires might also be required. Steel members on the pumping plant superstructure may require replacement or upgrade. Where foundations are inadequate, additional and/or replacement supports will need to be constructed. Improvements to the foundations could include cast-in-place concrete drilled piers or slab foundations and/or driving new or replacement steel H-piles. Some minor tree trimming and clearing of undergrowth will be required to provide access for the work. Because relocation of the platforms is not anticipated, tree removal will be minimal (less than 1 acre).

Pipe replacement will occur within the normal levee construction window between April 15 and October 30, and will require temporary piping around the construction area. Pump replacement will likely occur during winter to minimize irrigation service disruptions. Replacement of the pumps will be completed no later than April. To remove and reinstall the pumps, some localized minor maintenance dredging under the pump house might be required to clear sediment buildup, if any, around the pump bowls. Dredging will be performed by divers with dredging hoses. Construction equipment will generally reach sites from Garden Highway. No dewatering will be required. In-water work will be limited to removal and replacement of pumps by crane and any required repairs to steel pump platform superstructure. No fill placement or bank hardening is anticipated. Upon completion, disturbed overbank areas will be restored with native seed mix.

Development of New and Replacement Groundwater Wells

Approximately 13 existing water wells on the landside of the Sacramento River east levee will be disrupted by the proposed levee improvements and will require abandonment and replacement outside of the levee footprint. The existing wells will be destroyed in accordance with regulatory guidelines following construction of the replacement wells. The wells that will be abandoned and replaced include:

- Five existing agricultural wells in Reaches 1–4 that will be replaced by new wells outside the levee footprint;
- An agricultural well in Reach 6A that will be replaced by a new well either in Reach 6A or in Reach 5B that will serve as a back-up water supply for the new GGS/Drainage Canal that was addressed as part of the Phase 3 Project;
- An agricultural well in Reach 8 that will be abandoned and replaced with a new well outside the levee footprint;
- Five existing agricultural wells in Reaches 9–12 that will be abandoned and replaced outside the proposed levee footprint; and
- A well on the TNBC's Cummings tract, which serves as a redundant water supply for that preserve, will likely need to be abandoned and replaced.

In addition to replacement wells, approximately five new wells will be constructed to provide a water supply for habitat mitigation features:

- In Reach 6A, a groundwater well will be constructed to provide a back-up supply for the GGS/Drainage Canal during critically dry years, when surface water deliveries might be reduced;
- In Reach 7 or Reach 8, a new well is planned to provide irrigation water for woodland mitigation plantings that were addressed as part of the Phase 3 Project; and
- In the Fisherman's Lake area, a new well is proposed within Reaches 12–14 for maintenance of woodland plantings. Within Reaches 13–14, two new wells are planned to serve as supplemental water supplies for new marsh habitat that will be created in that area.

Precise locations for replacement and new water wells will be determined during the design process.

Well Construction

Depths of the proposed new and replacement wells on the landside of the Sacramento River east levee will typically range from 200 to 500 feet. Final depth will be determined after exploratory drilling to evaluate yield of water-bearing strata. Agricultural wells will generally be 16 inches in diameter; habitat mitigation wells may be smaller diameter, approximately 12 inches.

Well construction will begin with drilling of one exploratory hole (test boring) at each potential well site to identify the water-bearing strata. These data are used to evaluate preliminary design and to select well construction materials. Drilling of the exploratory holes will generally use mud rotary drilling methods which will utilize drilling muds (bentonite). For each test boring, a drill rig will be used to drill a 6- to 8-inch diameter test hole up to 500 feet in depth. Following completion of the test boring, the hole will be backfilled with the boring cuttings and bentonite.

For construction of each well, an outer casing and seal will initially be constructed to stabilize the hole and prevent contamination of lower soil layers during drilling process. An outer casing hole, generally 36-inch or less will initially be drilled to approximately 50 to 60 feet deep, lined with a steel casing, and the annular space outside of casing will be filled with grout. After the grout has set, the well hole will be drilled up to 500 feet deep. The well casing will be steel pipe with wire-wrapped well screen or perforated casing set at water bearing layers. After installation, the annular space around the casing and screens will be packed with gravel, and the upper approximately 50 feet will be sealed with grout. For the larger wells, the well casing will be 16-inch diameter or less and the bore holes will be sized for a 4- to
6-inch thick gravel pack in the annular space.

The final phase of construction will be well development, test pumping, and disinfection. Development will consist of swabbing or scouring the well with drilling equipment and pumping to consolidate gravel pack and remove fines and drilling fluid. Test pumping will be performed to establish the well yield and drawdown for final pump selection. Finally, the well will be disinfected with chlorine treatment, and a temporary cap will be installed. Well water from test pumping will be discharged into existing irrigation facilities, which the well serves, discharged into drainage ditches, or discharged directly onto adjacent agricultural fields.

Pumps will be installed in each well. For the mitigation wells, submersible pumps will normally be used. For the agricultural wells, a 6- by 6-foot concrete pad will be constructed at ground level to provide for mounting a vertical turbine well pump. A service pole with meter and control panel will need to be installed near each well to provide overhead electrical service.

Demolition of the existing wells will be performed in accordance with Sutter or Sacramento County regulations. Well equipment will be removed and salvaged or hauled away. The well pump bases and casing will be cut below surrounding grade. Abandonment will generally require grouting the well.

The well construction will require a total of approximately 3 weeks. Required construction equipment will include a well drill rig, pump, generator, grouting machine, crane, flatbed truck, light plant, and water truck. Site preparation and cleanup will require earthmoving equipment such as a front-end loader or small dozer to construct the working pad and pond for cuttings.

Reclamation of Borrow Sites

The Fisherman's Lake Borrow Area, the Novak borrow site, and the South Sutter borrow site are anticipated to be the primary sources of soil borrow for Phase 4a Project construction. However,

additional borrow sites already described in the biological assessments for the Phase 2 and 3 Projects may be utilized if the Phase 4a borrow sites are not able to supply all of the required fill material. Borrow material will be excavated from primarily agricultural lands that either are currently fallow or produce row or field crops. These sites may also contain scattered rural housing, drainage and irrigation features, and woodlands. The excavation limits on the borrow sites will provide a minimum buffer of 50 feet from the edge of the borrow site boundary. In areas with adjacent drainage features, however, the borrow sites grading may extend into the canal bank with a new patrol road constructed along the top of bank. Additionally, where features are blended into adjacent mitigation sites, the work will extend to the boundary to maximize site restoration area. From the property line boundary setback, the slope from existing grade down to the bottom of the excavation will be no steeper than 3H:1V. After excavation, disturbed areas will be finish graded in compliance with criteria for drainage of reclaimed land uses. Excavated soils not used for borrow material, such as the organic surface layer or soils considered unsuitable for levee construction, will be stockpiled and respread on-site after excavation. For areas planned to be returned to agricultural use, approximately 1 foot of topsoil will be removed and stockpiled for reuse during reclamation of the site. Sites will be reclaimed for use and either returned to agriculture or used for habitat mitigation ("Habitat Enhancement, Development, and Management" section below). Revegetation activities will include erosion control on excavated slopes (i.e., hydroseeding), application of fertilizer, and seeding.

Fisherman's Lake Borrow Area and Novak Borrow Site

The 469-acre Fisherman's Lake Borrow Area consists of multiple parcels beginning at Powerline Road and extending south to and beyond Radio Road. These parcels, including the 94-acre Novak borrow site, total approximately 563 acres.

Existing land uses include orchard, field crops, and rice cultivation. Some lands in the area include managed marsh and agricultural upland (field crop) areas owned by TNBC; these conservation areas will not be used for borrow operations. Approximately 367 acres of the Fisherman's Lake Borrow Area and approximately 66 acres of the Novak borrow site will be available for excavation of borrow material and used for several project purposes: levee improvements, relocation and extension of the Riverside Canal, woodland mitigation, other habitat creation, and borrow. The areas excavated for borrow material will be reclaimed as agricultural land, or converted to managed habitat including, grassland, agricultural land, or managed marsh depending on their location and existing land use. Plans for managed habitat elements are currently under design (detailed plans will be included in the Phase 4a Mitigation Monitoring Plan [MMP]). However, it is anticipated that portions of the AKT, Johnson, Natomas Urban Development, and Sharma parcels within the Fisherman's Lake borrow area will be converted into managed marsh complex with the remainder of these parcels to be reclaimed as grassland and agricultural land and managed as Swainson's hawk foraging habitat. Field crops on the Natomas Boot parcel will be reclaimed to this use following the temporary borrow operations. New irrigation pipes and drainage pipes will be installed to service these sites.

South Sutter, LLC Borrow Site

The South Sutter, LLC borrow site was previously identified and analyzed in the Phase 3 BA as an area that could serve as an additional source of borrow material to complete the levee improvements in Sacramento River east levee Reaches 4B–9B. The South Sutter, LLC borrow site is close enough to Sacramento River east levee Reaches 10–12 to contribute to the large quantity of borrow material that will be needed to construct the adjacent levee and seepage berms that comprise the Phase 4a Project improvements in these reaches. Approximately 62 acres of the approximately 80-acre site will be available for excavation of borrow material. This borrow site is currently used as croplands (alfalfa) and will be reclaimed to this use following the temporary borrow operations. The site will be preserved and managed as Swainson's hawk foraging habitat.

Prichard Lake Preserve

During the month of February 2010, Airport staff observed SAFCA's contractor using a road which runs adjacent to the Prichard Lake Preserve to access and egress a portion of the Airport's borrow site. This road had not been identified as an access road in the construction plans and specifications. Airport staff reported the incident to SAFCA and the contractor and requested the contractor discontinue using the road due to the proximity of the preserve which was created to provide habitat for giant garter snakes. The contractor's use of the dirt road resulted in damage, which SAFCA proposes to repair.

The access road will be repaired with a motor grader which will smooth out the road surface by re-contouring the existing rutted surface. A water truck will be present to provide dust control as needed. Access will be by existing roads and no excess materials will be generated. No in-water work will be required. Total duration will be less than one day. This activity will occur between May 1 and September 31, 2010.

Airport Land Exchange

SAFCA and the Airport will carry out a land exchange that will support expansion of Airport bufferlands along the eastern edge of the proposed new Elkhorn Irrigation Canal and provide SAFCA additional habitat mitigation land along the upper portion of the Sacramento River east levee outside of the 10,000 foot Airport Critical Zone. The exchange will involve SAFCA's acquisition of three Airport properties totaling approximately 54 acres on each side of SAFCA's Lausevic property in Reach 4a of the Sacramento River east levee. These properties will be developed by SAFCA as woodland planting areas. In exchange, the Airport will acquire the remainder of the Horangic and Binford-DeYoung properties (formerly analyzed as borrow sites in the Phase 3 BA) within the Airport's 10,000 foot Critical Zone that will not be developed as part of the Phase 2 and 3 Projects. This remainder, totaling approximately 45 acres, will be managed by the Airport in accordance with the Federal Aviation Administration Advisory Circular 150/5200-33B, *Hazardous Wildlife Attractants on or Near Airports.*

Habitat Enhancement, Development, and Management

Fisherman's Lake Habitat Complex and Other Habitat Creation/Preservation Sites

The area west and south of Fisherman's Lake (Reaches 12A–14 of the Sacramento River east levee) represents a unique opportunity to establish a large and interconnected block of diversified habitat on the west side of the Natomas Basin that will create multiple benefits for Natomas Basin Habitat Conservation Plan (NBHCP)-covered species. This complex will be developed beginning in the Phase 4a Project, with other improvements to continue in the Phase 4b Project. The proposed habitat developments will benefit the Fisherman's Lake habitat complex by:

- more than doubling TNBC's preserve holdings west of Fisherman's Lake by creating 122 acres of managed marsh complex, preserving approximately 127 acres of managed agricultural uplands, and establishing up to 40 acres of oak woodland groves;
- connecting two existing TNBC marsh preserves to establish a continuous block of 200 acres of managed marsh complex adjacent to the Fisherman's Lake slough;
- adding a new habitat component to the Fisherman's Lake Area—large oak woodland groves on the landside of the Sacramento River east levee—that will complement waterside woodland patches and provide native bird species greater opportunities to nest, find refuge from predators, and forage in nearby grassland and upland agriculture; and
- improving water quality for Fisherman's Lake habitat by increasing water circulation in and out of the area through reconfiguration and reoperation of irrigation and drainage canals.

Some of the habitat created as part of the Phase 4a Project will compensate for habitat impacts resulting from previous project phases. Additionally, some of the proposed Phase 4a Project habitat creation could occur at the same time as construction (and, thus, environmental impacts) of the Phase 3 Project.

In January 2006, RD 1000 discovered seepage at the interior foot of the levee at Pumping Plant 2, three sinkholes, and boils in the canal adjacent to the Pumping Plant. The Service was contacted and we agreed emergency work should be completed and once the emergency was over it will be necessary to determine if any follow-up under the Act will be necessary. Corps Regulatory determined that consultation with the Service was not necessary in order for them to issue an after-the-fact 404 permit for the action. The Corps did require as a Special Condition lfo the permit that RD 1000 mitigate for the loss of 0.6 acre of giant garter snake habitat. The permit required RD 1000 to compensate for effects to giant garter snakes with 5.4 acres of giant garter snake habitat. SAFCA has agreed to provide RD 1000 with 5.4 acres of giant garter snake habitat at the Fisherman's Lake Complex. Therefore, 5.4 acres of the Fisherman's Lake Complex will be used solely for the emergency work done by RD 1000 at Pumping Plant 2.

Giant Garter Snake Habitat /Managed Marsh Complex Creation
After the completion of borrow activities, soil borrow sites in the vicinity of Fisherman's Lake will be finish graded and planted with native marsh vegetation by SAFCA to create approximately 122 acres of managed marsh complex (including approximately 35% upland and

65% wetland habitats) that will benefit the giant garter snake. This habitat, consisting of open-water channels, tule benches, freshwater marshes, and upland plant communities, will provide giant garter snakes with basking areas, vegetative cover from predators, and foraging habitat. The marsh will be situated near and be functionally connected to TNBC's created marshes located on the Natomas Farms and Cummings Preserves. These two marshes, while adjacent to Fisherman's Lake, are separated from each other by private property. SAFCA will construct new marshes adjacent to these TNBC marshes which will be hydrologically connected, thereby providing for greater contiguous management areas and enhancing the value of the adjacent preserves to sustain the giant garter snake population. After establishment of the Phase 4a Project marsh, SAFCA will grant TNBC a conservation easement and enter into a stakeholder-specific management agreement (within the existing master agreement for habitat management between the two agencies) with TNBC, ensuring the permanent protection and management of these sites as habitat and open space.

Managed Marsh Creation - Marsh habitat will be created on cultivated rice fields and other fallow and cultivated croplands that will be acquired by SAFCA. During construction of the Phase 4a Project, these parcels will be temporarily used as a source of soil borrow material for levee and berm construction, with excavation removing up to 5 feet of soil from each of the borrow sites. These sites will then be converted to managed marsh complex. The marsh will consist of a mosaic of aquatic and upland habitats, and an upland buffer between the restoration sites and adjacent roads. This created marsh will maximize habitat edge transitions to provide for shorter distances between burrow, basking, and foraging areas.

Design of the giant garter snake marsh will follow the templates established by TNBC on recent projects and experience with the design, construction, and management of the Airport System's Willey mitigation site in the northeast part of the basin and its existing marsh mitigation project at Prichard Lake. These design templates feature a combination of uplands and shallow water bodies, sinuosity of swales, and water control structures to manage target water levels at different times of the year. The marsh will have perimeter fences to control and protect grazing animals, such as goats. Grazing by goats is a management technique successfully used by TNBC to reduce invasions of weedy thatch and exotic plants while retaining sufficient cover for giant garter snake and other semiaquatic species that rely on grassy uplands adjoining the wetland ponds. An essential component of the managed marsh complex will be procuring a firm, reliable water supply and good water quality throughout the giant garter snake's active season of April–October.

General Construction Plan for the Managed Marsh Complex - The managed marsh site will be constructed at excavated borrow sites within the Fisherman's Lake Borrow Area. The excavation limits for the borrow sites will be a minimum of 50 feet from the edge of the site boundary. From this setback, the slope from existing grade down to the bottom of the excavation will be no steeper than 3H:1V. After excavation, disturbed areas will be finish graded to allow creation of the marsh complex. Finish grading and installation of operational facilities and habitat features will take place in fall of 2010 and 2011. Planting will occur in the fall/winter of 2010/2011 and 2011/2012.

Excavated soils not used for borrow material, such as the 1-foot-deep organic surface layer or soils considered unsuitable for levee construction, will be stockpiled and respread on-site after excavation. Soil graded back into the site will result in a finish grade elevation somewhat higher than the final design grades. The borrow-site excavation operations will use water for dust control and to maintain proper moisture content in the borrow material. Any excess groundwater generated during temporary dewatering activities will be discharged into adjacent irrigation and drainage canals after application of appropriate water quality best management practices. Revegetation activities will include erosion control on excavated slopes (e.g., straw mulch, hydroseeding), application of fertilizer as needed, and seeding of an initial cover crop on the finish grade of the bottom of the borrow site. Marsh plantings will then be installed and the borrow site flooded. It is anticipated that no unsuitable soil material will be hauled off-site. Debris encountered during excavation will be hauled off-site.

Other construction components are as follows:

- **Maintenance and access roads.** All-weather roads up to 15 feet wide will be constructed away from the open water channels and between the upland areas in 25-foot-wide maintenance access areas.
- **Water supply and control facilities.** An essential component of the managed marsh complex will be procurement of a firm, reliable water supply and good water quality throughout the giant garter snake's active season (i.e., April–October). A well to provide a backup source of water will be installed in a location where it could supply water to the network of channels if it is needed to replace or supplement the surfacewater supply (see "Development of New and Replacement Groundwater Wells" subsection under the "Major Irrigation and Drainage Infrastructure Modifications" section above). Water control facilities, such as riser boards, will be installed at key points in the channels to allow maintenance of desired water levels.
- **Habitat features for giant garter snake.** At points along the channels, clusters of rocks will be installed above the water line to provide basking areas for the snakes. Tule benches will be planted between upland areas and the channels to provide cover for the snakes.

Canal Habitat Enhancement

Portions of the new (replacement) Riverside irrigation and drainage canal, will be enhanced to provide improved habitat for giant garter snake. Bank conditions will be modified (i.e., flattened slopes) resulting in improved conditions for movement of giant garter snake between existing and proposed rice and marsh habitats, and Fisherman's Lake between Reaches 11B and mid-14. In addition, ancillary or lateral canals in the vicinity of Fisherman's Lake will also likely receive improvements.

The Riverside Canal, which is discussed above in more detail under the "Major Irrigation and Drainage Infrastructure Modifications" section, will be relocated to enable management of existing NCMWC water supply infrastructure affected by levee widening. The relocated

Riverside Canal will continue to be managed to provide irrigation supplies and will be maintained and operated in the same manner as the existing NCMWC canals.

Agricultural Croplands

To compensate for the permanent loss of foraging habitat within the foraging range of potentially affected Swainson's hawk nest locations, SAFCA will create or preserve approximately 150 to 200 acres of high-quality foraging habitat in perpetuity. This habitat will be created or preserved in part by acquiring sites near Fisherman's Lake used for borrow material and reclaiming those sites to a mixture of cropland and grassland managed specifically to maximize foraging opportunities for Swainson's hawk. Agricultural cropland could also be created or preserved at the Novak and South Sutter, LLC borrow sites to the extent that these areas are used as sources of borrow material for the Phase 4a Project. Crop types and crop rotations will be managed to optimize the seasonal variation of prey availability for Swainson's hawks and other raptors. This upland agriculture will connect areas managed by TNBC to create a larger, more continuous block of high-quality Swainson's hawk foraging habitat. This block of foraging habitat will be adjacent to a 100- to 200-foot-wide zone, with blocks ranging from several hundred to several thousand feet in length, in which SAFCA will create landside woodland habitat (see "Landside Woodlands" section below).

Managed Grasslands on Levee Slopes, Seepage Berms, and Rights-of-Way

The proposed levee improvements will result in landside slopes that are less steep than the existing slopes, and several reaches of the Sacramento River east levee will have adjoining 100- to 300-foot-wide earthen seepage berms with a nearly flat slope (50H:1V or less). Parallel to the landside toe of enlarged levees and seepage berms will be maintenance setbacks, gravel access roads, utility corridors, as well as relief wells in some locations. Additional setback bufferland (sometimes composed of woodland corridors, canal corridors, or field crops) will flank some of these features, and property acquisition for the proposed project may leave SAFCA with remnant portions of acquired parcels that are nonessential to flood control uses. With the exception of the crown of the levee and the seepage berm access road, these areas will be managed as native perennial grassland. Most grassland will be mowed or grazed throughout the growing season, with an emphasis on mowing procedures and stubble height that optimize these areas for Swainson's hawk foraging habitat. This management regime will be in accordance with the Corps and State guidelines for levee inspection. However, the primary purpose and management priority of levees and seepage berms will continue to be flood protection, for which RD 1000 has principal management and maintenance responsibility.

An MMP will be developed for the Phase 4a Project's compensatory habitat components, and will include a monitoring program with performance criteria that will be developed to determine the progress of the managed grasslands toward achieving its goals. The MMP will include methods to create the grasslands, including native-grass mixes that will be seeded along new levee slopes and seepage berms, staging areas, and adjacent maintenance and utility rights-of-way. An initial baseline assessment of managed grassland sites will be conducted after the initial

seeding program, and then a monitoring program with performance criteria will be developed to determine the progress of the grassland habitats and to assess the need for adaptive management.

Landside Woodlands

In the Phase 4a Project, woodlands consisting of native riparian and valley oak woodland species, including elderberry shrubs, will be planted. Landside woodlands will be planted within a 100- to 200-foot-wide corridor adjacent to the relocated Riverside Canal in Reaches 12A–14 of the Sacramento River east levee. The riverside forest that borders the Sacramento River in the vicinity of Fisherman's Lake is patchy and contains considerable gaps. Establishing landside woodland corridors in these reaches will compensate for gaps in the riverside forest community and increase the interface of landside woodlands connected to the riverside riparian forest. SAFCA will also plant woodland groves in Reach 4A of the Sacramento River east levee on the properties shown in Exhibit 2, north and south of the Phase 2 woodland planting area. Combined, the Reach 4A woodland planting areas will create a nearly 40-acre block of nesting habitat south of Riego Road adjacent to both existing woodland habitat on the waterside of the levee and foraging habitat on surrounding farmland.

Groves will generally be at least 50 feet wide and several hundred feet long, depending on location constraints. Portions of the created woodlands will be at least 100 feet wide to promote successful nesting by a variety of native birds deeper within the grove canopy. At maturity, stand structure will vary from closed-canopy woodland to valley oak savanna vegetation types, with a native perennial grassland understory.

Planting sites will require suitable soil conditions, irrigation water during a 3- to 5-year establishment phase, reduced risk of wildfire, and minimal depth to seasonally high groundwater or other natural water sources to sustain trees once irrigation ceases. To provide irrigation water, groundwater wells will likely need to be drilled in the vicinity of the plantings (see "Development of New and Replacement Groundwater Wells" subsection under the "Major Irrigation and Drainage Infrastructure Modifications" section above).

A mixture of native riparian and woodland species will be planted, but the predominant species will be valley oak, the primary tree species that will be affected by the proposed improvements to the Sacramento River east levee; and cottonwood, which is a preferred nest tree for Swainson's hawks in the Basin and is faster growing than valley oak. Establishing woody vegetation will likely require more than one technique, including planting nursery stock, live cuttings, and acorn planting in winter, sustained by flood irrigation, drip, or agricultural-scale spray heads. The woodland planting areas will also accommodate trees and elderberry shrubs that will be removed from existing groves to make way for the proposed flood control system features and transplanted. Taking into account predictable and unavoidable mortality within the first 5 years of establishment, the intent is to have an average stem density of approximately 162 trees and shrubs per acre within 5–10 years of growth. Wherever possible, groves will be bordered by restricted-access public lands and rights-of-way to reduce the risk of vandalism and other inappropriate uses that may threaten wildlife values or risk wildfires from human sources.

The MMP with performance criteria will be developed to determine the progress of the woodland habitats. The criteria for measuring performance will be used to determine if the conservation component is trending toward sustainability (reduced human intervention) and to assess the need for adaptive management (e.g., changes in design or maintenance revisions).

Conservation Measures

Valley Elderberry Longhorn Beetle

The following measures shall be implemented to avoid, minimize, and compensate potential adverse effects on valley elderberry longhorn beetle:

- Worker awareness trainings for construction personnel shall be conducted by a qualified biologist approved by the Service before the commencement of construction activities and as needed when new personnel begin work on the project. The program shall inform all construction personnel about the life history and status of the beetle, the need to avoid damaging the elderberry plants, measures to avoid and minimize impacts on this species and its habitat, the conditions of relevant regulatory permits, and the possible penalties for not complying with these requirements. Written documentation of the training shall be submitted to the Service within 30 days of the completion of training.
- All elderberry shrubs that are located adjacent to construction areas, but can be avoided, shall be protected through establishment of a fenced avoidance area. The high visibility fencing shall be placed at least 20 feet from the dripline of the shrubs, unless otherwise approved by the Service. This fencing shall prevent the encroachment of construction personnel and vehicles and protect the shrubs.
- No insecticides, herbicides, or other chemicals that might harm the beetle or its host plant shall be used within 100 feet of the elderberry shrubs.
- Dirt roadways and disturbed areas within 100 feet of elderberry shrubs shall be watered at least twice a day to minimize dust emissions.

Giant Garter Snake

The following measures shall be implemented to avoid, minimize, and compensate potential adverse effects on giant garter snake:

- Worker awareness trainings for construction personnel shall be conducted by a qualified biologist approved by the Service and California Department of Fish and Game (CDFG) before commencement of construction activities and as needed when new personnel begin work on the project. The program shall inform all construction personnel about the life history and status of the snake, the need to avoid damaging suitable habitat and causing snake mortality, measures to avoid and minimize impacts on this species and its habitats, the conditions of relevant regulatory permits, and the possible penalties for not complying with these requirements.
- Written documentation of the training shall be submitted to the Service and CDFG within 30 days of the completion of training.

- Construction and other ground-disturbing activities within 200 feet of suitable aquatic habitat for the giant garter snake shall not commence before May 1, with initial ground disturbance expected to correspond with the snake's active season (as feasible in combination with minimizing disturbance of nesting Swainson's hawks). Initial ground disturbance shall be completed by October 1.
- Some components of the proposed project may occur prior to the beginning of the defined giant garter snake active season. Activities, such as utility relocations, and removal of residential or agricultural structures, will be conducted before May 1, typically farther than 200 feet from suitable aquatic habitat for giant garter snakes or in habitat unsuitable for estivation.
- Some components of the proposed project may occur beyond the end of the defined giant garter snake active season and up to November 30 of all construction years. For example, demobilization and site restoration (e.g., hydroseeding, gravelling) activities may extend through November of all years. However, these activities will not generally be within 200 feet of potential aquatic habitat. SAFCA does not anticipate any construction activities to occur within potential giant garter snake habitat outside of this species' active season. Should limited construction need to occur in snake habitat outside of the active season, however, SAFCA will coordinate with the Corps, Service, and CDFG. Further, SAFCA recognizes that it may be necessary to implement additional avoidance and minimization measures for project activities that occur beyond October 1 such as dewatering of aquatic habitat, continuous disturbance in construction areas for the last two weeks in September and through completion of construction, installation of exclusionary fencing prior to October 1, or other measures to minimize the potential for giant garter snakes in construction areas.
- Any aquatic habitat for the snake that is dewatered shall remain dry for at least 15 consecutive days after April 15 and before excavating or filling of the dewatered habitat. If complete dewatering is not possible, potential snake prey (e.g., fish and tadpoles) shall be removed so that snakes and other wildlife are not attracted to the construction area.
- Within 24 hours before the commencement of ground-disturbing activities, areas within 200 feet of suitable aquatic habitat for giant garter snakes shall be surveyed for giant garter snakes by a qualified biologist. The biologist shall provide the Service with written documentation of the monitoring efforts within 48 hours after the survey is completed. The action area shall be re-inspected by a qualified biologist whenever a lapse in construction activity of 2 weeks or greater has occurred. A qualified biologist shall be present on-site during initial ground disturbance activities. The biologist shall be available throughout the construction period and shall conduct weekly monitoring visits to ensure avoidance and minimization measures are being properly implemented.
- Before the commencement of construction activities, high-visibility fencing shall be erected to protect suitable giant garter snake habitat that is located adjacent to construction areas, but can be avoided, from encroachment of personnel and equipment. The fencing shall be inspected before the start of each work day and maintained by SAFCA and construction personnel until completion of the project. The fencing shall be removed only when the construction within a given area is completed. This fencing shall conform to the specifications detailed in the measure below.

- Tightly woven fiber netting (mesh size less than 0.25 inch) or similar material shall be used for erosion control and other purposes at the project site to ensure that giant garter snakes are not trapped or become entangled by the erosion control material. Coconut coir matting is an acceptable erosion control material. No plastic mono-filament matting shall be used for erosion control. The edge of the material shall be buried in the ground to prevent giant garter snakes from crawling underneath the material. Erosion control structures shall be constructed so runoff shall be directed away from sensitive habitats, directing water flow into existing drainages or disperse water across vegetated areas to avoid concentrating water.
- The number of access routes, the number and size of staging areas, and the total area of the proposed project activity shall be limited to the minimum necessary. Routes and boundaries shall be clearly demarcated. Movement of heavy equipment to and from the project site shall be restricted to established roadways and designated staging areas to minimize habitat disturbance. Project-related vehicles shall observe a 20-mile-per-hour speed limit within construction areas, except on county roads and on state and Federal highways.
- All snakes encountered shall not be harassed, harmed, or killed and shall be allowed to leave the construction area on their own volition. If any snake is observed retreating into an underground burrow within the project limits, no construction shall be allowed within a 50-foot radius of the burrow. A 50-foot radius nondisturbance buffer zone shall be established until a qualified biologist can make a determination that the snake is or is not a giant garter snake. If a qualified biologist determines that a giant garter snake has retreated into an underground burrow within the project limits, and the area of the burrow cannot be avoided by the project, then under the approval, supervision and direction of the Service and a qualified biologist, the burrow shall be excavated to allow personnel with appropriate authority to capture and handle the giant garter snake to relocate the giant garter snake outside of the action area. The biologist shall notify the Service immediately if any listed species are found on-site, and shall submit a report, including date(s), location(s), habitat description, and any corrective measures taken to protect the species found.
- During construction operations, stockpiling of construction materials, portable equipment, vehicles, and supplies shall be restricted to the designated construction staging areas. All heavy equipment, vehicles, and supplies shall be stored at the designated staging area at the end of each work period.
- To eliminate an attraction to predators of the giant garter snake, all food-related trash items, such as wrappers, cans, bottles, and food scraps, shall be disposed of in closed containers.
- After construction activities are complete, any temporary fill or construction debris shall be removed and temporarily disturbed areas restored to their preproject conditions. An area subject to "temporary" disturbance includes any area that is disturbed during the project, but that, after project completion, shall not be subject to further disturbance and has the potential to be revegetated. All giant garter snake habitats subject to temporary ground disturbances, including storage and staging areas and temporary roads, shall be restored. These areas shall be recontoured, if appropriate, and revegetated with appropriate native plant species to promote restoration of the area to preproject

conditions. Appropriate methods and plant species used to revegetate such areas shall be determined on a site-specific basis in consultation with the Service and CDFG and in accordance with the Service's *Guidelines for the Restoration and/or Replacement of Giant Garter Snake Habitat.*

- SAFCA shall maintain and monitor temporarily disturbed areas of giant garter snake habitat for 1 year following the completion of construction and restoration activities. Monitoring reports documenting restoration of these areas shall be submitted to the Service upon the completion of the restoration implementation and 1 year after the restoration implementation. Monitoring reports shall include photo-documentation and shall describe when restoration was completed, what materials were used, specified plantings, and justifications of any substitutions to the Service-recommended guidelines.
- Unavoidable adverse effects to giant garter snake habitat shall be compensated through the creation and preservation of suitable aquatic and upland habitat for this species.

Jeopardy Determination

In accordance with policy and regulation, the jeopardy analysis in this BO relies on four components: (1) the *Status of the Species*, which evaluates the giant garter snake's and valley elderberry beetle's range-wide condition, the factors responsible for that condition, and their survival and recovery needs; (2) the *Environmental Baseline*, which evaluates the condition of the giant garter snake in the action area, the factors responsible for that condition, and the relationship of the action area to the survival and recovery of the valley elderberry beetle and giant garter snake; (3) the *Effects of the Action*, which determines the direct and indirect impacts of the proposed federal action and the effects of any interrelated or interdependent activities on the giant garter snake and valley elderberry beetle; and (4) the *Cumulative Effects*, which evaluates the effects of future, non-Federal activities in the action area on the giant garter snake and valley elderberry beetle.

In accordance with policy and regulation, the jeopardy determination is made by evaluating the effects of the proposed Federal action in the context of the giant garter snake's and valley elderberry beetle's current status, taking into account any cumulative effects, to determine if implementation of the proposed action is likely to cause an appreciable reduction in the likelihood of both the survival and recovery of the giant garter snake and valley elderberry beetle. The jeopardy analysis in this BO places an emphasis on consideration of the range-wide survival and recovery needs of the giant garter snake and valley elderberry beetle and the role of the action area in the survival and recovery of the giant garter snake and valley elderberry beetle as the context for evaluating the significance of the effects of the proposed Federal action, taken together with cumulative effects, for purposes of making the jeopardy determination.

Status of the Species

The status of the species for the giant garter snake is incorporated by reference from the programmatic BO (pages 45-50 and 54-60).

Environmental Baseline
The environmental baseline for the giant garter snake is incorporated by reference from the programmatic BO (page 50-54 and 61-62).

Effects of the Proposed Action

Giant garter snake

Direct Effects due to Phase 4a Construction

Phase 4a construction includes work along reaches 10-15 along the Sacramento River east levee, woodland corridor creation along reaches 10-14, construction at various pumping plants (Bennett, Northern, Number 3, Number 5, Riverside, and 10 private), relocation of the Riverside Canal, creation of Fisherman's Lake managed marsh complex, and land exchanges and acquisitions. Construction during this phase will occur in 30.64 acres of developed land; 54.39 acres of annual grassland; 304.75 acres of row crop, field crop, and fallow agriculture; 28.92 acres of orchard; 1.84 acres of rice; 4.97 acres of canals, ditches, and marsh; 1.62 acres of seasonal wetlands or riverine wetlands; and 36.27 acres of woodland (including 2.49 acres of Sacramento River riparian). At the end of construction for Phase 4a the proposed land cover types will be 30.68 acres of developed land; 70.68 acres of created woodland; 7.14 acres of preserved woodland; 287.73 acres grassland (primarily levee slope grassland and a small amount of grassland associated with the canals); 10.20 acres of irrigation canals and ditches; and 57.00 acres of fallow land. The newly created cover-types from the project will be protected from future development through either a flood control easement, conservation easement, or drainage easement.

Components of Phase 4a work which will occur outside of the giant garter snake's active season include utility relocation and removal of residential or agricultural structures. These will be conducted before April 15. Giant garter snakes have been observed to overwinter as far as 250 meters from aquatic habitat (Wylie *et.al* 1997). Given that giant garter snakes are generally inactive during the winter months, SAFCA's working during the inactive season will kill giant garter snakes that may be overwintering within the construction footprint. To reduce disturbing and/or killing giant garter snakes that may be overwintering in uplands that will be affected by working out of season, SAFCA has proposed to place exclusionary fencing which will be erected prior to October 1 in areas in which giant garter snakes may overwinter. The fencing will exclude giant garter snakes from entering the area where SAFCA will be constructing during the winter. This fence will be monitored daily prior to and during construction to insure that there are no breaches that a snake could get through. Areas that are unlikely to have overwintering giant garter snakes include areas which have active construction or agricultural activities occurring on them. Effects likely due to construction during the inactive season includes crushing of snakes within their burrows and crushing snakes which are out of the burrow to bask or move short distances but are slower moving due to the temperature.

The remainder of the project will be constructed during the active period (May 1 – October 1) for the snake, resulting in a decreased risk of direct mortality of snakes and will be completed in one

construction season, minimizing the length of the effects to snakes. Effects to snakes are highly likely given the number of acres affected within Phase 4a. Effects will include removal of cover and basking sites and filling or crushing of burrows or crevices due to excavation activities. Snake movements will be obstructed due to construction activities blocking access to aquatic or upland habitat. The large amount of construction equipment and number of workers within the Phase 4a action area will increase the likelihood of running over basking or dispersing snakes. Filling in of aquatic habitat such as rice, marsh and ditches will decrease the prey base for giant garter snakes. All of these effects are likely to result in the direct disturbance, displacement, injury, and/or mortality of snakes. Some of these effects will be minimized through SAFCA's conservation measures. Much of the work will occur during the snake's active season which will reduce snake mortality because the snakes will be able to leave or avoid habitat that is undergoing construction. Dewatering habitat prior to working within in it by at least 2 weeks prior to disturbance will facilitate snakes leaving the construction areas. Speed limits along construction roads as well as worker awareness training should minimize vehicles running over basking or dispersing snakes. SAFCA has proposed to construct new canals and ditches prior to filling the existing ditches. This should allow both an area for the snakes to disperse to as well as help provide prey for snakes.

SAFCA will be removing 1.84 acres of rice when constructing along the NCC south levee pumping plants. Additionally 4.97 acres of drainage ditches and marsh habitat will be converted to grassland habitat primarily because of the Sacramento River East Levee improvements. To compensate for the loss of habitat, SAFCA has proposed to compensate with 6.81 acres of managed marsh with a conservation easement near Fisherman's Lake. There are about 5.93 acres of upland habitat that is associated with the ditches and marsh. Because the aquatic features are going to be filled, this area will no longer serve the same function of adjacent upland habitat for the giant garter snake.

Part of the Phase 4a project involves relocating the Riverside Main Irrigation Canal. The current Riverside Canal is 18,600 linear feet with 2.72 acres of giant garter snake aquatic habitat and 17.98 acres of giant garter snake upland habitat. SAFCA will fill this canal as a result of the levee improvement construction. A new canal will be constructed several hundred feet east of the existing canal. Because the lower 6,000 linear feet of has been abandoned due to lack of agricultural need below Reach 17, SAFCA will not be relocating the lower 6,000 linear feet of the Riverside Canal. The Riverside Canal will be extended 2,869 linear feet northwest of where it currently begins (up to Reach 11B) in order to provide water for the Novak property which will be protected in perpetuity as Swainson's hawk foraging habitat and will require a source of irrigation water. This segment of the canal (Reaches 11B – 13) will be earthen lined and will have vegetation planted along the banks. The first 5,541 linear feet of replacement Riverside Canal (Reaches 13 – mid-14) will also be earthen lined and have vegetation planted along the banks. Aquatic giant garter snake habitat created with the construction of these portions of the Riverside Canal will be 5.74 acres. Upland giant garter snake created along the newly constructed Riverside Canal will be 9.53 acres. The remaining 6,530 linear feet of Riverside Canal (Reaches mid-14 – 16) will be concrete lined. Aquatic giant garter snake habitat within the concrete lined section will be 4.46 acres and upland giant garter snake habitat created along

the concrete lined section will be 7.40 acres. In Phase 4b, SAFCA will construct an additional 4,110 linear feet of concrete lined canal (Reach 17).

While the existing Riverside Canal is concrete lined, years of maintenance and disturbance have caused the concrete to break apart and leaving areas for vegetation to become established as well as crevices and burrows which could be used by giant garter snakes for overwintering. SAFCA will double the amount of aquatic habitat with similar quality (earthen lined segment) as currently exists within the Riverside Canal. Additionally they will replace the aquatic migratory corridor along its entire length. While aquatic connectivity will be replaced the quality of the section of canal which is lined with concrete will be reduced from what is being affected. Concrete lining will limit vegetation establishment and persistence along the canal, and this will subject giant garter snakes using the canal to greater predation because there will not be cover for the snakes to evade predators in. SAFCA is offsetting the degradation of this section of the Riverside Canal by providing twice as much aquatic habitat in between Reaches 11B and mid-14 as exists in the current Riverside Canal. Therefore, the amount of aquatic habitat available to the snake will not have decreased; however, the quality of the habitat within Reaches mid-14 and 17 will be degraded due to the concrete lining of the new canal and the lack of vegetation along the sides of the canal.

SAFCA will be creating 122 acres of managed marsh adjacent to Fisherman's Lake. Creation of marsh within this area will provide long term benefits to the Natomas Basin by permanently protecting and increasing marsh habitat adjacent to Fisherman's Lake, one of the core giant garter snake areas within the Natomas Basin. Creation of managed marsh in these locations will connect two existing TNBC preserves (Cummings and Natomas Farms) hydrologically and with similar cover-types creating a block of 204 acres of managed marsh immediately adjacent to Fisherman's Lake.

There will be short term temporary effects at the sites due to borrow activities and habitat creation. Of the 122 acres proposed for conversion to managed marsh about 74.66 acres are either fallow crops, row and field crops, or ruderal/annual grassland and the remaining 47.34 acres are currently farmed in rice. There will be a loss of aquatic giant garter snake habitat in the form of rice during borrow activities and the construction of the managed marsh. The 122 acres of managed marsh compensates for effects that occurred as part of Phase 2, Phase 3, and Phase 4a. Long term the amount of giant garter snake habitat adjacent to Fisherman's Lake will be increased and connect to existing giant garter snake preserves which will offset the effects of the project on the giant garter snake.

Cumulative Effects

The cumulative effects for the giant garter snake have not changed and are incorporated by reference from the amended programmatic BO (pages 68-70).

Conclusion

After reviewing the current status of the giant garter snake, the environmental baseline for the species, the effects of the proposed project, and the cumulative effects on this species, it is the Service's BO that the proposed Natomas Landside Improvements Project Phase 4a, as described herein, is not likely to jeopardize the continued existence of the giant garter snake.

The Corps and SAFCA have proposed to improve flood protection for the Natomas Basin above what currently exists. Two Habitat Conservation Plans (HCP) currently exist within the Natomas Basin and are based on future development occurring within the permit area of the Metro Air Park Habitat Conservation Plan (MAPHCP) and the NBHCP. The baselines and assumptions for which these HCPs were developed were based on no urban development occurring within the basin outside of these permit areas and landuse practices (primarily agriculture) remaining essentially the same. Sacramento County and the City of Sacramento have been in discussions with the Service about additional development outside of the existing permit areas. As discussed in the Environmental Baseline, the Natomas Basin has experienced a large amount of rice fallowing both in land held by private farmers and leases terminated on Sacramento County Airport property. While the Service has concluded that SAFCA's project will not jeopardize the giant garter snake, it could enable future growth to occur that otherwise will not be allowable but for these actions, which will require additional analysis to determine if this growth could jeopardize any of the 22 species covered by the MAPHCP and NBHCP. However, although future growth in the Natomas Basin outside of the permit area is under discussion, the Service does not consider it to be reasonably foreseeable at this time, as no specific proposals are proposed or under review. If growth outside of the permit areas were to occur within the Natomas Basin, these future projects must have a higher conservation outcome than currently exists in the HCPs and must be closely coordinated with the Service.

INCIDENTAL TAKE STATEMENT FOR PHASE 4A CONSTRUCTION

Section 9 of the Act and Federal regulation pursuant to section 4(d) of the Act prohibit the take of endangered and threatened species, respectively, without special exemption. Take is defined as harass, harm, pursue, hunt, shoot, wound, kill, trap, capture or collect, or to attempt to engage in any such conduct. Harass is defined by the Service as an intentional or negligent act or omission which creates the likelihood of injury to a listed species by annoying it to such an extent as to significantly disrupt normal behavioral patterns which include, but are not limited to, breeding, feeding or sheltering. Harm is defined by the Service to include significant habitat modification or degradation that results in death or injury to listed species by impairing behavioral patterns including breeding, feeding, or sheltering. Incidental take is defined as take that is incidental to, and not the purpose of, the carrying out of an otherwise lawful activity. Under the terms of section 7(b)(4) and section 7(o)(2), taking incidental to and not intended as part of the agency action is not considered to be prohibited taking under the Act, provided that such taking is in compliance with this Incidental Take Statement.

The measures described below are nondiscretionary for listed species in Phase 4a of this opinion and must be implemented by the Corps in order for the exemption in section 7(o)(2) to apply.

The Corps has a continuing duty to regulate the activity that is covered by this incidental take statement. If the Federal agency (1) fails to adhere to the terms and conditions of the incidental take statement, and/or (2) fails to retain oversight to ensure compliance with these terms and conditions, the protective coverage of section 7(o)(2) may lapse.

Amount or Extent of Take

Giant Garter Snake

The Service anticipates that incidental take of the snake will be difficult to detect or quantify for the following reasons: giant garter snakes are cryptically colored, secretive, and known to be sensitive to human activities. Snakes may avoid detection by retreating to burrows, soil crevices, vegetation, or other cover. Individual snakes are difficult to detect unless they are observed, undisturbed, at a distance. Most close-range observations represent chance encounters that are difficult to predict. It is not possible to make an accurate estimate of the number of snakes that will be harassed, harmed or killed during Phase 4a construction activities (staging areas, work on canal banks, soil borrow areas, and vehicle traffic to and from borrow areas) or long-term maintenance of the GGS/Drainage Canal and Brookfield rice. In instances when take is difficult to detect, the Service may estimate take in numbers of individual snakes per acre of habitat lost or affected as a result of the action. Therefore, the Service anticipates that all giant garter snakes inhabiting 56.87 acres of aquatic and 23.91 acres of upland habitat may be harassed, harmed, or 3 giant garter snakes killed by loss and destruction of habitat due to construction of Phase 4a.

Effect of the Take

The Service has determined that this level of anticipated take is not likely to result in jeopardy to the giant garter snake.

Reasonable and Prudent Measures

The following Reasonable and Prudent Measures are necessary and appropriate to minimize the effect of the proposed project on the giant garter snake.

1. All conservation measures as described in the biological assessment, and as re-stated here in the Project Description section of this BO, must be fully implemented and adhered to.

2. Effects of harassment of individual giant garter snakes within the proposed project, and of the loss or degradation of the species' habitat shall be minimized.

Terms and Conditions

In order to be exempt from the prohibitions of section 9 of the Act, the Corps must ensure compliance with the following terms and conditions, which implement the reasonable and prudent measures described above. These terms and conditions are nondiscretionary.

1. The following Terms and Conditions implement Reasonable and Prudent Measure one (1):

    a. The Corps and SAFCA shall minimize the potential for incidental take of the giant garter snake resulting from the project related activities by implementation of the project description as described in the biological assessment and the project description (pages 2 - 37) of this BO.

    The Corps and SAFCA shall include full implementation and adherence to conservation measures as a condition of any permit issued or contract awarded for the project.

    b. If requested, before, during, or upon completion of ground-breaking and construction activities, the project proponents shall allow access by Service and/or California Department of Fish and Game personnel to the project site to inspect the project for effects to giant garter snakes and to determine if the proposed conservation measures are being implemented.

    c. A Service-approved Worker Environmental Awareness Training Program for construction personnel shall be conducted by a Service-approved biologist for all construction workers prior to the commencement of construction activities. As needed, training shall be conducted in Spanish for Spanish language speakers and other languages as needed or necessary.

    d. The Corps and SAFCA shall require that all personnel associated with this project are made aware of the conservation measures and the responsibility to implement them fully. This could be accomplished by including a copy of this BO within its solicitations for design and construction of the proposed project and making the primary contractor responsible for implementing all requirements and obligations included within the BO, as well as and educating and informing all other contractors involved in the project as to the requirements of the BO.

2. The following Terms and Conditions implement Reasonable and Prudent Measure two (2):

    a. At least 30 calendar days prior to initiating construction activities, the project proponents shall submit the names and curriculum vitae of the biological monitor(s) for the proposed project. Monitors shall have the ability to differentiate giant garter snakes from other snakes and the authority to stop construction activities if a snake is encountered during construction until appropriate corrective measures have been completed or until the snake is determined to be unharmed.

b. For Phase 4a work that will occur outside of the giant garter snake active window, (power pole relocations, removal or relocation of residential or agricultural structures, construction of lower GGS/Drainage Canal and portions of Elkhorn Canal, and removal of trees and elderberry shrubs) exclusion fencing shall be placed around upland areas that giant garter snakes could use to overwinter prior to October 1. The exclusionary fencing shall be monitored everyday prior to and during construction to ensure that openings do not develop that would allow the entry of a giant garter snake into the construction area.

c. If it appears that any other construction activity may go beyond October 1, the project proponents shall contact the Service as soon as possible, but not later than July 15 of the year in question, to determine if additional measures are necessary to minimize take. Areas that have not had ground breaking occur prior to September 15 shall not work past October 1.

d. The project proponents shall implement Best Management Practices to prevent sediment from entering areas containing snake habitat, including, but not limited to, silt fencing, temporary berms, no cleaning of equipment in or near snake habitat, installation of vegetative strips, and temporary sediment disposal.

e. Runoff from dust control and oil and other chemicals used in other construction activities shall be retained in the construction site and prevented from flowing into areas containing snake habitat. The runoff shall be retained in the construction areas by creating small earthen berms, installing silt fences or hay-bale dikes, or implementing other measures on the construction site to prevent runoff from entering the habitat of the snake.

f. The biologist shall notify the Service immediately if any listed species are found on-site, and will submit a report, including date(s), location(s), habitat description, and any corrective measures taken to protect the species found. The biologist shall be required to report any take to the Service immediately by telephone at (916) 414-6600 and by electronic mail or written letter addressed to the Division Chief, Endangered Species Program, within one (1) working day of the incident. The project area shall be re-inspected by the monitoring biologist whenever a lapse in construction activity of two weeks or greater has occurred.

g. To the extent feasible, the project proponents shall confine clearing of vegetation and scraping, or digging, of soil to the minimal area necessary to facilitate construction activities.

h. After completion of construction activities, any temporary fill and construction debris shall be removed. A written report regarding restoration of temporarily disturbed sites shall be submitted to the Service within ten (10) working days of the completion of construction at the project site.

i. The Corps and SAFCA shall ensure compliance with the reporting requirements.

j. Prior to commencement of construction on May 1, 2010, the Corps and SAFCA shall have the Phase 4a Mitigation and Monitoring Plan and Site Specific Management Plan completed and approved by the Service.

k. RD 1000 will include the number of giant garter snakes which are taken due to maintenance of the GGS/Drainage Canal in their annual report. Take should be recorded as actual number of snakes harmed, harassed, or killed, and the acreage of habitat affected. Once the incidental take coverage provided for within this BO has been reached, RD 1000 may not conduct any further maintenance activities along the GGS/Drainage Canal for the remainder of the year without consulting with the Service.

l. If spoil from the GGS/Drainage Canal is to be placed on adjacent property during the inactive season (October 1 to May 1), the land should be either active row or orchard (they should have been farmed the previous year). Spoil should not be placed on agricultural fields which have been fallowed for one year or longer, or ruderal/grassland habitat as this may be habitat for overwintering snakes.

m. TNBC shall manage the Brookfield rice in concert with all of the preserves they manage for the NBHCP. Therefore, no more than 10 percent of TNBC managed rice shall be out of production in any given year including Brookfield.

Reporting Requirements

A post-construction compliance report prepared by the monitoring biologists must be submitted to the Deputy Assistant Field Supervisor at the Sacramento Fish and Wildlife Office within thirty (30) calendar days of the completion of construction activity or within thirty (30) calendar days of any break in construction activity lasting more than thirty (30) calendar days. This report shall detail: (i) dates that groundbreaking at the project started and the project was completed; (ii) pertinent information concerning the success of the project in meeting compensation and other conservation measures; (iii) an explanation of failure to meet such measures, if any; (iv) known project effects on the giant garter snake, if any; (v) occurrences of incidental take of any these species; and (vi) other pertinent information.

The Corps must require SAFCA to report to the Service immediately any information about take or suspected take of federally-listed species not authorized in this BO. SAFCA must notify the Service within 24 hours of receiving such information. Notification must include the date, time, and location of the incident or of the finding of a dead or injured animal. In the case of a dead animal, the individual animal should be preserved, as appropriate, and held in a secure location until instructions are received from the Service regarding the disposition of the specimen or the Service takes custody of the specimen. The Service contact persons are, Division Chief,

Endangered Species Program at (916) 414-6600, and the Resident Agent-in-charge of the Service's Law Enforcement Division at (916) 414-6660.

Any contractor or employee who during routine operations and maintenance activities inadvertently kills or injures a listed wildlife species must immediately report the incident to their representative. This representative must contact the CDFG immediately in the case of a dead or

injured listed species. The CDFG contact for immediate assistance is State Dispatch at (916) 445-0045.

CONSERVATION RECOMMENDATIONS

Section 7(a)(1) of Act directs Federal agencies to utilize their authorities to further the purposes of the Act by carrying out conservation programs for the benefit of endangered and threatened species. Conservation recommendations are discretionary agency activities that can be implemented to further the purposes of the Act, such as preservation of endangered species habitat, implementation of recovery actions, or development of information and data bases.

1. The Corps and SAFCA should assist in the implementation of the draft, and when published, the final Recovery Plan for the giant garter snake.

2. The Corps and SAFCA should provide funding to researchers studying topics identified by the Service in the draft, and when published, the final Recovery Plan for the giant garter snake.

3. The Corps should use environmental restoration authorities to acquire and restore garter snake habitat.

To be kept informed of actions minimizing or avoiding adverse effects or benefiting listed and proposed species or their habitats, the Service requests notification of the implementation of any conservation recommendations.

REINITIATION - CLOSING STATEMENT

This concludes formal consultation with the Corps on the Natomas Levee Improvement Project, Phase 4a. As provided in 50 CFR 402.16, re-initiation of formal consultation is required where discretionary Federal agency involvement or control over the action has been maintained (or is authorized by law) and if: (1) the amount or extent of incidental take is exceeded; (2) new information reveals effects of the proposed action may affect listed species or critical habitat in a manner or to an extent not considered in this opinion; (3) the agency action is subsequently modified in a manner that causes an effect to listed species or critical habitat that was not considered in this opinion; or (4) a new species or critical habitat is designated that may be affected by the proposed action. In instances where the amount or extent of incidental take is exceeded, any operations causing such take must cease pending re-initiation.

If you have any questions regarding this BO on the Natomas Landside Improvements Project Phase 4a, please contact Jennifer Hobbs at (916) 414-6541 or Jana Affonso, Chief, Sacramento Valley Branch at (916) 414-6645.

Sincerely,

for Susan K. Moore
Field Supervisor

Subject: Phase 4b Section 7 Appendage to the Programmatic Biological Opinion for the Natomas Levee Improvement Program, Landside Improvements Project, Sacramento and Sutter Counties, California

Dear Ms. Kirchner:

This is in response to your June 30, 2010, request for formal consultation with the U.S. Fish and Wildlife Service (Service) on the Natomas Levee Improvement Program (NLIP), Landside Improvements Project Phase 4b (proposed project) in Sacramento and Sutter Counties, California. Your request was received on June 30, 2010. A programmatic biological opinion (BO) was completed on October 9, 2008 (File 81420-2008-F-0195-5), amended on May 6, 2009 (File 81420-2008-F-0195-R001), October 2, 2009 (81420-2008-F-0195-R002), February 2, 2010 (81420-2008-F-0195-R003), and August 17, 2010 (81420-2008-F-0195-R004). The programmatic BO analyzed the entire proposed project on the landscape level and because details of the project were only available for Phase 2, provided an incidental take statement for only that phase of the project. A BO for the Phase 3 portion of the project was completed on September 28, 2009, (File 81420-2009-F-0890) and amended on October 2, 2009 (File 81420-2009-F-0890-R001), and August 17, 2010 (81420-2009-F-0890-R002). A BO for the Phase 4a portion of the project was completed on May 20, 2010 (81420-2010-F-0446). The Service has reviewed the information submitted by your office requesting formal consultation on the effects of the Phase 4b project on the federally-listed endangered vernal pool tadpole shrimp (*Lepidurus packardi*) the federally-listed threatened vernal pool fairy shrimp (*Branchinecta lynchi*) (collectively, vernal pool crustaceans), valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*), and giant garter snake (*Thamnophis gigas*) (GGS) in accordance with section 7 of the Endangered Species Act of 1973, as amended (16 U.S.C. 1531 *et seq.*) (Act). Critical habitat has been designated for the beetle and vernal pool crustaceans; however, the proposed project is not located within nor will it affect critical habitat for these species or any other federally-listed species. Critical habitat has not been designated for the GGS; therefore, none will be affected.

The programmatic BO (File 81420-2008-F-0195-5) did not include effects to vernal pools or the species that could inhabit them. However, given the level of impacts to vernal pool species in this phase, the Service has determined that the project can be appended to the Service's February 28, 1996, *Programmatic Formal Endangered Species Act Consultation on Issuance of 404 Permits for Projects with Relatively Small Effects on Listed Vernal Pool Crustaceans within the Jurisdiction of the Sacramento Field Office, California (1-1-96-F-001)*(Vernal Pool Programmatic Opinion).

This BO is based on information provided in the U.S. Army Corps of Engineers' (Corps) letter requesting consultation and their biological assessment. A complete administrative record is on file at the Sacramento Fish and Wildlife Office.

CONSULTATION HISTORY FOR PHASE 4b

February 2010. AECOM, the consultant to the Sacramento Area Flood Control Agency (SAFCA), provided the Service with an administrative draft Phase 4b biological assessment.

June 23, 2010. The Service, the Corps, and AECOM met to discuss the draft Phase 4b biological assessment.

June 30, 2010. The Corps initiated section 7 consultation on Phase 4b.

BIOLOGICAL OPINION

Description of Action Area

The NLIP Landside Improvements Project consists of the following phases of construction.

Phase 2, which was discussed in more detail in the Programmatic and Phase 2 BO includes work along:

- 5.3-milelong Natomas Cross Canal (NCC) south levee,
- the Sacramento River east levee from the NCC south levee to 2,000 feet south of the North Drainage Canal,
- the Elkhorn Main Irrigation Canal (Elkhorn Canal) between the North Drainage Canal and the Elkhorn Reservoir settling basin,
- the site of Reclamation District (RD) 1000 Pumping Plant No. 2, and
- adjacent land.

Phase 3, which was discussed in more detail in the Phase 3 BO, includes work along:

- the Sacramento River east levee south of the limits of the Phase 2 improvements to just south of Interstate 5 (I-5),
- the Pleasant Grove Creek Canal (PGCC) west levee,
- the Natomas East Main Drainage Canal (NEMDC) west levee between Elkhorn Boulevard and Northgate Boulevard,

- the area between Elkhorn Reservoir and the West Drainage Canal where a new GGS/Drainage Canal will be constructed,
- the Elkhorn Canal downstream of Elkhorn Reservoir, and
- RD 1000 Pumping Plant No. 2.

Phase 4a, which was discussed in more detail in the Phase 4a BO includes work along:

- improvements to the Sacramento River east levee south of the limits of the Phase 3 improvements to approximately 2.5 miles north of Interstate 80,
- the relocation of the Riverside Main Irrigation Canal (Riverside Canal),
- creation of habitat in the vicinity of Fisherman's Lake, and
- improvements and modifications to a number of pumping plants along the Sacramento River east levee and NCC south levee.

Phase 4b, will include work along:

- the Sacramento River east levee south of the limits of the Phase 4a Project along Reach A:16–20 of the Sacramento River east levee,
- the American River north levee (Reach I:1–4),
- the PGCC (Reach E),
- the NEMDC west levee (Reaches F–H),
- improvements to the West Drainage Canal from I-5 to Fisherman's Lake,
- relocation of the Riego Road Canal along the NEMDC west levee, and
- relocation of the Vestal Drain and Morrison Canal along the NCC.

As greater flood protection will be provided for the entire Natomas Basin, the action area includes the entire Natomas Basin.

Description of Proposed Action

Overview of NLIP Landside Improvements Project

SAFCA is designing the NLIP in coordination with the Federal and state flood control project sponsors, the Corps, and the State of California Central Valley Flood Protection Board (CVFPB), to address the deficiencies in the Natomas levee system with a focus on achieving a 100-year level of flood protection by 2011. This will require improving the following landside conditions along the NCC south levee, the Sacramento River east levee, and the PGCC and NEMDC west levees:

- Inadequate freeboard—The NCC south levee and portions of the Sacramento River east levee are not high enough to provide at least 3 feet of freeboard above the 100-year water surface elevation. Additional reaches do not provide 3 feet of freeboard above the 200-year design water surface elevation.
- Underseepage and through-seepage vulnerability—Most of the levee reaches do not meet recently adopted Federal criteria for safely containing underseepage and through-seepage

when the water surface in the adjacent channel reaches the 100-year elevation or, in some cases, the 200-year elevation.

The NLIP Landside Improvements project encompasses addressing freeboard deficiencies through levee raises; addressing seepage potential using a combination of seepage berms, cutoff walls, and relief wells; and acquiring additional right-of-way to construct the improvements and to prevent encroachment into the flood control system. In addition, the project has been designed to include an enlarged levee embankment (adjacent setback levee) along the landside of the existing Sacramento River east levee to minimize the need for substantial removal of vegetation and structural encroachments on the water side of this levee in compliance with Corps guidance. These improvements will include recontouring the levee slopes where necessary to provide a 3:1 horizontal-to-vertical (3H:1V) waterside slope and a 3H:1V (preferred) or 2H:1V (maximum) landside slope.

The specific goal of the NLIP Landside Improvements Project is to provide at least 100-year flood protection as quickly as possible while laying the groundwork to achieve at least urban-standard (200-year) flood protection over time.

Additional project objectives that influenced SAFCA's project design were to:

(1) use flood control projects in the vicinity of the Sacramento County Airport (Airport) to facilitate better management of Airport lands to reduce hazards to aviation safety, and

(2) use flood control projects to enhance habitat quality and values by increasing the extent and connectivity of the lands in the Natomas Basin being managed to provide habitat for the giant garter snake, the state-listed threatened Swainson's hawk (*Buteo swainsoni*), and other special-status species.

Recognizing the importance of securing maximum Federal support for the flood control project, SAFCA has explored implementation approaches that also advance the achievement of Federal aviation and wildlife protection objectives where complementary opportunities exist. Accordingly, the proposed project includes the following elements:

- The project will include construction of the GGS/Drainage Canal to provide giant garter snake habitat and some drainage infrastructure west of the Airport. Construction of these facilities will allow for dewatering of the ditch running along the western portion of the Airport runway system, which the airport recognizes as a flight safety hazard, by offsetting the effects on drainage and irrigation needs and GGS habitat.

- The project will combine SAFCA's need for levee embankment and berm material with the Sacramento County Airport System's need to modify the condition and management of Airport bufferlands to reduce wildlife hazards affecting Airport operations in a manner that enhances the connectivity of areas managed specifically for their habitat value.

Levee Modifications and Seepage Remediation

Sacramento River East Levee Reach A: 16–20

Phase 4b construction on the Sacramento River east levee will include improvements along Reach A: 16–20, a distance of approximately 3.4 miles. Phase 4b Project work along the Sacramento River east levee includes:

- construct an adjacent levee in Reach A:16–20;
- install either soil-bentonite (SB), cement-bentonite (CB), or SCB cutoff wall through the existing levee or along the landside toe of the existing levee in Reach A:19B–20;
- construct 100- to 300-foot-wide seepage berms in Reach A:16 through a portion of Reach A:19B;
- install relief wells, spaced at 60- to 100-foot intervals, approximately 20 feet beyond the toe of the seepage berm locations in Reach A:16–19B and along some of the entrance channels to the landside pump stations;
- establish a 50-foot-wide operations and maintenance access corridor and a 20-foot-wide utility corridor adjacent to the toe of the adjacent levee or seepage berm in Reach A:16–19A;
- establish a 10-foot-wide operations and maintenance access corridor and a 20-foot-wide utility corridor adjacent to the toe of the adjacent levee or seepage berm in Reach A:19B–20;
- remove trees and elderberry shrubs during the dormant season as needed from the levee improvement footprint (Reach A:16–20), which extends to 120–460 feet from the existing levee centerline.
- fill the portions of the Riverside Canal still used for irrigation (Reach A:16–18A) and the abandoned portion of the Riverside Canal (Reach A:18A–19B); the relocated Riverside Canal was addressed in the Phase 4a Project BA (SAFCA 2010);
- plant up to 10 acres of woodland groves in Reach A:16 on the Marsten and Wang parcel;
- reconstruct the Garden Highway intersections at Orchard Lane and 20 additional private parcel ramps; and
- clear vegetation clearing within the modified levee prism and easement.

The main construction staging areas will be located on parcels located in Reach A: 16–18 of the Sacramento River east levee. These areas will be fenced and used for the contractor's and engineer's construction trailers, parking for personnel, machine maintenance tools and parts, possibly water trucks, and the storage of fuels and other materials to be used for construction. The project right-of-way along the construction area also will be used for staging of construction materials and equipment. This analysis does not include staging areas since they have not been specified at this time. Consultation will need to be reinitiated at a later date to include an effects analysis of these areas if needed.

Site Preparation (Tree Removal, Clearing, Grubbing, and Stripping)

Site preparation will entail clearing structures and woody vegetation from the action area (Reach A:16–20) and stripping the top 12 inches of material from the landside slope of the existing levee and the footprint of the adjacent setback levee and seepage berm (as applicable). All vegetation in the operations and maintenance corridor within 15 feet of the levee toe or seepage berm will

be cleared. However, outside of this 15-foot zone, trees within the utility and operations and maintenance corridors will be avoided where feasible. Where trees cannot be retained, the permanent maintenance access corridor will be cleared but not stripped. Large roots, tree stumps, root balls, deleterious material, and below-ground infrastructure will then be grubbed from the working area. To the extent feasible, trees that must be removed from within the footprint will be removed during winter prior to the construction season to avoid disturbing the nesting behavior of special-status birds in spring. Trees suitable for relocation will be transplanted outside of the footprint to new woodland planting areas, where a substantial number of new trees will also be planted. Excess earth materials (organic soils, roots, and grass from borrow areas and the adjacent levee foundation, and excavated material that does not meet levee embankment criteria) will be re-spread on the surface of the new levee slopes and seepage berms, be used in the reclamation of borrow areas, or hauled off-site to landfills. Debris generated during the clearing and grubbing operations will be hauled off-site to landfills, concrete recycling plants, or cogeneration facilities.

Vegetation, particularly trees and elderberry shrubs, will be removed within the Phase 4b footprint of the Sacramento River east levee (Reach A: 16–20), as needed, during the vegetation dormant season. This footprint consists of the adjacent setback levee, a seepage berm, an operation and maintenance corridor, and a utility corridor, resulting in a total project footprint that ranges from approximately 120 to 460 feet wide. This operation will require removal of some trees and relocation/removal of elderberry shrubs, which occur mostly adjacent to existing roads. During winter, large trees will be felled approximately 3 feet above ground level, with stumps temporarily left in place. Logs will be cut into rounds for removal by contractors with handheld equipment and removed in light vehicles. Small trees and elderberry shrubs, where feasible, will be relocated to woodland conservation corridors that are part of the Phase 4b Project with conservation easements placed on them. A minimal amount of ground disturbance in specific areas will occur. During the GGS active season (after May 1 and before October 1), the stumps will be removed and the footprint cleared and grubbed completely to prepare for construction.

Relocation and Removal of Landside Structures, Irrigation Ditches and Other Facilities

Approximately 21 residences along the Sacramento River east levee and other farm structures that are within the footprint of the levee improvements will have to be removed or relocated farther from the flood damage reduction facilities before the start of levee construction in those areas. About 15 residences identified for removal are in Reach A: 16–18B and approximately 6 residences in Reach A:19A–20. Irrigation facility conveyance features, distribution boxes, wells, and standpipes within the project footprint of will be demolished and replaced as needed.

Power poles that currently exist on the landside slope of the levee and at the landside levee toe will need to be relocated and/or rerouted to accommodate the widened levee footprint. To the extent feasible, mainline utility poles will be relocated beyond the landside levee toe or berms. Should placing poles on top of the seepage berms be required, either raised foundations or steel-reinforced concrete piers will be constructed to prevent the poles from affecting the seepage berms. Some poles may need to be relocated to the water side of the existing levee. Tree

pruning will likely be required in some locations to accommodate the poles and wires. The relocations will be conducted in coordination with the utility companies and the construction operations. The Corps will review where power pole relocations will occur and reinitiate section 7 consultation with the Service if use of these sites may affect federally listed species.

Debris from structure demolition, power poles, utility lines, piping, and other materials requiring disposal will be hauled off-site to a suitable landfill. Wells and septic systems will be abandoned in accordance with the applicable state and county requirements.

Construction of Adjacent Levee, Cutoff Walls, and Seepage Berms

Borrow material from the borrow source will be delivered to the levee construction sites by scrapers or haul trucks where it will be spread by motor graders and compacted by sheepsfoot rollers to build the adjacent levee and seepage berms. The existing levee already meets height requirements, and the top of the new levee will be no higher than the elevation of the existing levee crown. The landside slope of the adjacent levee will be 3H:1V (horizontal feet:vertical feet) in Reach A:16–19A and vary in Reach A:19B–20 between 3H:1V to 2H:1V. In those areas where a cutoff wall is required, the adjacent levee will be built up a height approximately 5 feet above existing grade at the toe of the levee to create a working platform for cutoff wall installation. Three-foot-wide cutoff walls made of SB, CB, or SCB will be installed either through the existing levee or along the landside toe of the existing levee, with the top of the cutoff walls being at least 5 feet above existing ground surface and extending to a maximum depth of 110 feet below ground surface in some areas. Between Reach A: 16–20 borrow material will be spread and compacted for construction of the 120- to 300-foot-wide seepage berms.

Installation of Relief Wells and Monitoring Wells

Relief wells will be constructed at selected locations where the seepage berms cannot be wide enough or cutoff walls deep enough to meet the required seepage remediation design parameters. Relief wells will be constructed along some of the entrance channels to the landside pump stations. Relief wells will be spaced at 60- to 100-foot intervals approximately 20 feet beyond the toe of the berm and will extend to depths of between 60 to 80 feet below the ground surface. Relief well surface discharge near the seepage berm toe will flow into new collection ditches or existing roadside ditches that will convey the water to RD 1000 Pumping Plant Nos. 1A and 1B, or other parts of the interior drainage system.

Reconstruction of Garden Highway at Intersections

Where the cutoff wall will be constructed through the crown of the adjacent levee, reconstruction work on Garden Highway will be required to restore the landside lane of the roadway. Garden Highway intersections at Orchard Lane and 20 private parcel ramps, RD 1000 facility access ramps at RD 1000 Pumping Plants Nos. 1A and 1B, and City Sump 160 will require reconstruction to accommodate the adjacent levee. It is anticipated that Garden Highway will be extended up and onto the widened adjacent levee at these locations to meet with the secondary roads. Approach embankments at the intersections will be enlarged and entire intersections will

be repaved. Intersecting roadway embankments will be designed to meet Sacramento County roadway design criteria, typically extending the approach embankment approximately 600 feet outward from the adjacent levee. Traffic control measures and detours will be required during this phase of construction.

Lands Disturbed

Improvements to Reaches 16-20 of the Sacramento River East Levee will disturb and convert 30.32 acres of developed areas such as homes, roads, and other infrastructure, 33.23 acres of annual grassland, 5.56 acres of row and field crop, 4.16 acres of orchard, 1.37 acres of canals or ditches, and 25.62 acres of woodlands to 28.8 acres of developed area and 71.46 acres of managed grassland on the new levee and seepage berm. Five elderberry shrubs with 44 stems greater than one inch in diameter will be transplanted due to levee and seepage rehabilitation.

American River North Levee Reach I: 1-4

Construction of the proposed action along the American River north levee will include improvements from the Gateway Oaks Drive to Northgate Boulevard, a distance of approximately 2.3 miles. Phase 4b Project work along the American River north levee includes:

- a new levee slope (3H:1V) will be constructed adjoining the existing American River north levee from Station 0+00 to 115+71;
- installation of a SB, CB, or SCB cutoff wall through the existing levee or along the landside toe of the existing levee from Station 0+00 to 115+71;
- establishment of a 20-foot-wide operations and maintenance access corridor and a 10-foot-wide utility corridor adjacent to the levee toe;
- removal and/or transplantation of trees and elderberry shrubs during the dormant season as needed from the levee improvement footprint, which extends 106 feet landward from the existing levee centerline;
- removal of landside woodlands within 15 feet of the new levee slope to comply with Corps levee vegetation standards;
- reconstruction of the Garden Highway intersections at Natomas Park Drive, Truxel Road, Arden Garden Connector, Northgate Boulevard, and four additional private parcel ramps; and
- vegetation clearing within the modified levee prism and easement.

Site Preparation (Tree Removal, Clearing, Grubbing, and Stripping)

Site preparation for the American River North Levee Reach I is the same as described above under the Sacramento River east levee reaches 16-20. The footprint consists of the adjacent setback levee, a seepage berm, an operation and maintenance corridor, and a utility corridor, resulting in a total flood control footprint is approximately 106 feet wide from the existing levee centerline. This operation will require removal of some trees and relocation/removal of elderberry shrubs.

Reconstruction of Garden Highway Intersections

Garden Highway intersections at Natomas Park Drive, Truxel Road, Arden Garden Connector, Northgate Boulevard, and four additional private parcel ramps will require reconstruction to accommodate the installation of the cutoff wall and levee slope flattening. The ramps will be reconstructed to current general ramp and intersection geometry. Where alternate access to the private parcels is available, the private ramps will be removed and not replaced. The design will meet City of Sacramento roadway design criteria. Traffic control measures and detours will be required during this phase of construction.

Lands Disturbed

Improvements to Reaches 1-4 of the American River North Levee will disturb and convert 19.59 acres of developed areas such as homes, roads, and other infrastructure, 0.03 acre of annual grassland, and 6.91 acres of woodlands to 12.69 acres of developed area and 13.84 acres of managed grassland on the new levee and seepage berm. Five elderberry shrubs with 37 stems greater than one inch in diameter will be transplanted due to levee and seepage rehabilitation.

Pleasant Grove Creek Canal West Levee, Reach E

Phase 4b Project construction on the PGCC west levee will include improvements along the entire length of the PGCC, a distance of approximately 3.3 miles. Phase 4b Project work along the PGCC west levee includes:

- raising the west levee by 1–1.5 feet above the existing levee height to provide 3 feet of levee height above the 0.005 AEP water surface profile;
- flattening levee slopes to 3H:1V;
- establishing a 50-foot-wide operations and maintenance access corridor and a 20-foot-wide utility corridor adjacent to the levee toe;
- removing trees and elderberry shrubs during the dormant season as needed from the levee improvement footprint, which extends 313 feet landward from the existing levee centerline; and
- clearing vegetation within the modified levee prism and easement.

Site Preparation

Site preparation is as described above under Sacramento River east levee except trees are generally not present along the landside or waterside toe of the existing toe of the PGCC west levee. If trees are present in the action area of the PGCC, trees will be relocated or avoided as appropriate and described above under the "Sacramento River East Levee – Site Preparation" section.

Levee Raising

Levee raising will be carried out in a manner similar to the work completed on the NCC as part of the Phase 2 Project. To obtain three feet of levee height above the 0.005AEP water surface,

these levee sections will be raised approximately 1–1.5 feet above the existing levee height. The levee will be constructed to a 3H:1V waterside slope and a 5H:1V theoretical landside slope due to the landward setback of the Phase 3 Project construction. The Triangle Properties Borrow Area will be the most likely source for import material.

Lands Disturbed

Improvements to the PGCC will disturb 1.37 acres of developed areas such as homes, roads, and other infrastructure, 3.35 acres of annual grassland, 16.02 acres of rice, and 0.017 acre of landside woodlands. This area will be converted to 20.91 acres of developed area.

Natomas East Main Drainage Canal West Levee, Reaches F-H

Phase 4b Project construction on the NEMDC west levee will include improvements along the entire length of the NEMDC, a distance of approximately 6.8 miles. Phase 4b Project work along the NEMDC west levee includes:

- raising the NEMDC South west levee by 1–1.5 feet above the existing levee height to provide 3 feet of levee height above the 0.005 AEP water surface profile along a 500-foot-long section of the NEMDC west levee south of Elkhorn Boulevard from Station 313+00 to 318+50;
- raising the NEMDC North west levee by 1–2 feet above the existing levee height to provide 3 feet of levee height above the 0.005 AEP water surface profile from Elkhorn Boulevard to a point approximately 1 mile upstream of Elverta Road;
- flattening levee slopes to 3H:1V along the NEMDC North;
- installing either SB, CB, or SCB cutoff wall through the existing levee or along the landside toe of the existing levee along the NEMDC North;
- establishing a 20-foot-wide operations and maintenance access corridor and a 15-foot-wide utility corridor adjacent to the levee toe;
- removing trees and elderberry shrubs during the dormant season as needed from the levee improvement footprint, which extends 313 feet landward from the existing levee centerline; and
- removing riparian woodlands and landside woodlands within 15 feet of the levee toe along NEMDC west levee from Sankey Road south to the intersection with the Arden-Garden Connector.

Levee Raising

Levee raising will be carried out in a manner similar to the work completed on the NCC as part of the Phase 2 Project. To obtain three feet of levee height above the 0.005 AEP water surface, levee sections will be raised approximately 1–2 feet above the existing levee height. The levee will be constructed to a 3H:1V waterside and landside slope. The Triangle Properties Borrow Area and the Krumenacher site will be the most likely source for import material.

Lands Disturbed

Improvements to the NEMDC will disturb 26.72 acres of developed areas such as homes, roads, and other infrastructure, 66.38 acres of annual grassland, 30.79 acres of fallow crops, 0.02 acre of canals or ditches, 0.03 acre of marsh, 22.48 acres of rice, 0.01 acre of seasonal wetlands, 2.09 acres of landside woodlands, and 0.74 acre of waterside woodlands. This area will be converted to 28.8 acres of developed area and 120.46 acres of managed grassland on the new levee and seepage berm.

Major Irrigation and Drainage Infrastructure Modifications

West Drainage Canal

Currently, the West Drainage Canal is characterized by mostly barren, steep banks with little or no cover or foraging habitat for GGS. This condition extends over several miles of the lower canal system. Improvements to the West Drainage Canal will be designed to enhance GGS corridor habitat compared to the existing habitat conditions found on the West Drainage Canal south of I-5 and to increase the functional values of the managed wetlands complex on the west side of Fisherman's Lake. The canal abuts the north and east sides of TNBC's Rosa Preserve for approximately 1.5 miles at the east end of the lower canal.

Improvements to the West Drainage Canal include realignment of an approximately 1 mile portion of the West Drainage Canal near Reach 11A of the Sacramento River east levee and modifications to the existing canal. The proposed realignment of the West Drainage Canal is designed to lessen the canal's potential as a wildlife attraction hazard for Airport operations by relocating the western portion of the canal farther away from the airport operations area. The realigned West Drainage Canal has been designed to improve the continuity of the canal corridor for movement of GGS between Fisherman's Lake managed wetlands and other managed wetlands and rice fields in the northern part of the Natomas Basin by creating a shoreline band of GGS habitat.

Canal Alignment

Habitat features will be designed into the realigned portion of the canal (in the vicinity of Reach 11A of the Sacramento River east levee) and added to the north bank of the existing canal between the realigned portion of the canal and Powerline Road and to the south bank between Powerline Road and the Fisherman's Lake slough. The new alignment will abandon and reroute approximately 4,700 feet of the West Drainage Canal. The modified West Drainage Canal, which will require a right-of-way of up to 150 feet for approximately 1.2 miles, will have a bottom width of up to 30 feet, stable 3H:1V bank slopes on one or both sides, and a narrow, variable width bench on one side of the canal. A 20-foot-wide maintenance and inspection road will flank each side of the canal and will be slightly elevated above adjacent land to improve an all-weather road condition. Culverts will cross under the patrol road to allow continued drainage into the canal from adjacent fields. The realignment will include re-routing of a small section of the West Drainage Canal (starting at the M10 Drain south of I-5, which leads to RD 1000's

Pumping Plant No. 5) to a north-south orientation to improve the management of adjacent agricultural parcels, and to move the canal farther from the Airport Operations Area in the vicinity of the west runway. Regrading of agricultural parcels between new and old canal alignment may be required for drainage. The normal managed water depth for this reach of the West Drainage Canal will be 6–7 feet in winter and 7–8 feet in summer under both existing and proposed conditions.

Opportunities to improve the existing West Drainage Canal are constrained by the existence of a row of power line poles located on the south side of the West Drainage Canal west of Powerline Road and on the north side of the canal east of Powerline Road. Because the poles are close to the top of the canal bank, canal improvements will not be feasible on both sides of the canal unless the power line poles were relocated farther away. Therefore, improvements will be focused on the north bank of the canal west of Powerline Road (east of the realigned portion) and the south bank of the canal east of Powerline Road. No improvements will be made to the south bank west of Powerline Road, and only a 20-foot-wide right-of-way for a maintenance road will be added to the north bank east of Powerline Road.

On the north side of the West Drainage Canal west of Powerline Road and the south side of the canal east of Powerline Road, the steep bank will be laid back to a stable 3H:1V slope to prevent ongoing bank slumping and reduce the need for future bank repairs and sediment removal. In these locations, the easement will be expanded between 25 and 35 feet to accommodate flattening of the banks, widening the maintenance road, and adding a 15- to 20-foot-wide setback between the road and adjacent crop fields to place and dry canal sediment and floating debris. Suitable excavated material from laying back the canal bank will be used to elevate an all-weather road above the existing field grade. Besides flattening to a 3H:1V slope, bank improvements will include creating a 2- to10-foot-wide submerged bench with tule growth to prevent aquatic weeds such as water primrose from attaching to the bank and then expanding across the canal water surface. Bank width will vary depending upon site constraints.

Clearing and Grubbing/Stripping

Prior to construction of the realigned West Drainage Canal, the canal right-of-way surface will be cleared and stripped to a depth of 4 to 6 inches, with removal of low-growing vegetation and loose surface soils. Additional over-excavation up to 3 feet deep may be required if materials not suitable for embankment foundations are encountered. Earthen materials removed during this stage will be stockpiled for reuse in embankments, topsoil re-spread, or adjacent berm construction. Non-earthen materials that are not suitable for reuse in embankments will be wasted and hauled off-site. Natural gas pipelines, gas wells, and other gas facilities will be avoided or reconfigured in design of the new West Drainage Canal.

Erosion Control and Demobilization/Cleanup

Erosion control measures will be installed prior to the start of construction and maintained throughout the duration of the construction to minimize sedimentation of adjacent waterways. A hydroseeding truck will be used at the end of the construction to seed any disturbed area. Water

trucks will be used throughout construction to control dust in any disturbed areas. Following construction, all disturbed areas will be vegetated and the construction site will be generally cleaned up including hauling off unused and waste materials. All construction equipment will be taken off-site.

Lands Disturbed

Modification to the West Drainage Canal will disturb 0.06 acre of annual grassland, 25.36 of row and field crops, 3.10 acres of fallow crops, 12.96 acres of canals or ditches, and 2.06 acres of rice. This area will be converted to 28.06 acres of developed area and 15.48 acres of canals.

Riego Road Canal

A portion of an irrigation canal owned by Natomas Central Mutual Water Company (NCMWC) will be disrupted by the proposed improvements to the NEMDC west levee (Reaches F–G). The affected portion includes approximately 4,000 feet of irrigation canal, approximately 250 feet of buried irrigation piping and culverts, and several irrigation control turn-out structures. These facilities will be relocated outside of the levee footprint as part of the Phase 4b Project. To prevent disruption of irrigation service, the NCMWC irrigation system will be replaced with in-kind facilities compatible with the new levee footprint. The new canal will be a highline canal with 3H:1V side slopes and a maintenance road on each of the embankments. A right-of-way of up to 100 feet beyond the new levee footprint will be required for the new facility.

Lands Disturbed

Modification to Riego Road Canal will disturb 0.70 acre of canals or ditches and 6.43 acres of rice. This area will be converted to 0.70 acre of managed grassland and 6.43 acres of canals.

Private Irrigation Ditches and Groundwater Wells

Sacramento River East Levee Reach A: 16-20

Several private irrigation water wells are located in the vicinity of Bryte Bend Road and Garden Highway. The wells at the southeast end of the Riverside Canal (Reach 18) adjacent to Bryte Bend Road will be disrupted by the proposed levee improvements and will be relocated as part of the proposed action. This well discharges directly to the existing Riverside Canal for irrigation service to the adjacent fields for agricultural use. The water well will be relocated outside of the flood control footprint (by drilling replacement wells and abandoning the existing well) and sited at least 100 feet off of the adjacent levee or seepage berm toe. To prevent disruption of service in the fields, the private irrigation well will be replaced with in-kind facilities compatible with the new levee footprint.

Depths of the proposed new and replacement wells on the landside of the Sacramento River east levee will typically range from 200 to 500 feet. Final depth will be determined after exploratory

drilling to evaluate yield of water-bearing strata. Agricultural wells will generally be 16 inches in diameter.

Well construction will begin with drilling of one exploratory hole (test boring) at each potential well site to identify the water-bearing strata. These data are used to evaluate preliminary design and to select well construction materials. Drilling of the exploratory holes will generally use mud rotary drilling methods which will utilize drilling muds (bentonite). For each test boring, a drill rig will be used to drill a 6- to 8-inch diameter test hole up to 500 feet in depth. Following completion of the test boring, the hole will be backfilled with the boring cuttings and bentonite.

For construction of each well, an outer casing and seal will initially be constructed to stabilize the hole and prevent contamination of lower soil layers during drilling process. An outer casing hole, generally 36-inch or less in diameter, will initially be drilled to approximately 50 to 60 feet deep, lined with a steel casing, and the annular space outside of casing will be filled with grout. After the grout has set, the well hole will be drilled up to 500 feet deep. The well casing will be steel pipe with wire-wrapped well screen or perforated casing set at water bearing layers. After installation, the annular space around the casing and screens will be packed with gravel, and the upper approximately 50 feet will be sealed with grout. For the larger wells, the well casing will be 16-inch diameter or less and the bore holes will be sized for a 4- to 6-inch thick gravel pack in the annular space.

The final phase of construction will be well development, test pumping, and disinfection. Development will consist of swabbing or scouring the well with drilling equipment and pumping to consolidate gravel pack and remove fines and drilling fluid. Test pumping will be performed to establish the well yield and drawdown for final pump selection. Finally, the well will be disinfected with chlorine treatment, and a temporary cap will be installed. Well water from test pumping will be discharged into existing irrigation facilities which the well serves, discharged into drainage ditches, or discharged directly onto adjacent agricultural fields.

Pumps will be installed in each well. For the mitigation wells, submersible pumps will normally be used. For the agricultural wells, a 6- by 6-foot concrete pad will be constructed at ground level to provide for mounting a vertical turbine well pump. A service pole with meter and control panel will need to be installed near each well to provide overhead electrical service.

Demolition of the existing wells will be performed in accordance with Sutter or Sacramento County regulations. Well equipment will be removed and salvaged or hauled away. The well pump bases and casing will be cut below surrounding grade. Abandonment will generally require grouting the well.

Natomas East Main Drainage Canal

Numerous private irrigation facilities along the NEMDC will be disrupted by the proposed levee improvements and will therefore be relocated as part of the proposed action. These private facilities include nine landside water wells that provide irrigation for cultivation of adjacent fields. The water wells will be relocated outside of the Phase 4b Project footprint (by drilling

replacement wells and abandoning existing wells) and sited at least 100 feet off of the future levee toe. In addition to the wells, approximately 1,500 feet of local field irrigation ditches and approximately 2,500 feet of buried irrigation piping will be relocated. To prevent disruption of service in the fields, the private irrigation systems will be replaced with in-kind facilities compatible with the new levee footprint.

Pleasant Grove Creek Canal

Numerous private irrigation facilities along the PGCC west levee will be disrupted by the proposed levee improvements and will be replaced as part of the proposed action. These private structures, consisting of eight landside water wells and one private river pump, service the adjacent fields for agricultural use. The water wells will be relocated outside of the Phase 4b Project footprint (by drilling replacement wells and abandoning the existing wells). The river pump discharge pipes through the levee will be raised and a new positive control valves and an air release/siphon breaker valve will be added. In addition to the wells and river pump, approximately 1,900 feet of local irrigation canals and approximately 2,200 feet of buried irrigation piping will be relocated. To prevent disruption of service in the fields, the private irrigation facilities will be replaced with in-kind structures compatible with the new levee footprint. Some RD 1000 drainage facilities will be relocated prior to PGCC construction, including approximately 5,900 feet of drainage canal and 750 feet of pipe.

Lands Disturbed

Modification to private irrigation relocations will disturb 0.26 acre of developed areas such as homes, roads, and other infrastructure, 2.85 acres of annual grassland, 0.02 acre of canals or ditches, and 13.11 acres of rice. This area will be converted to 16.24 acre of canals.

Natomas Cross Canal South Levee Ditches

Along the NCC south levee, between Stations 19+00 to 97+00, the Vestal Drain ditch runs parallel to the landside toe of the levee. The geotechnical analyses of the ditch in its present location results in unacceptable seepage gradients at the base of the canal. From Stations 199+00 to 244+00, the Morrison Irrigation Canal has similar gradient problems. Both canals will be removed and replaced as part of the proposed action. Replacement canals will be constructed 400 feet from the existing landside toe of slope. The new canal size will be designed with 3H:1V side slopes. It is anticipated that there will be a balance of fill material available to fill the old canal with the material excavated from the new canal. About 125,000 cubic yards will be excavated for the new canals and used to backfill the old canals.

Modification to the Morrison Canal and Vestal Drain will disturb 0.95 acre of developed areas such as homes, roads, and other infrastructure, 2.58 acres of annual grassland, 7.16 acres of fallow crops, 0.15 acre of canals or ditches, and 26.17 acres of rice. These areas will be converted to 37.01 acres of canals.

Modifications to Pumping Plants

Modification of RD 1000's Pumping Plant Nos. 1B, 6, and 8

The existing discharge pipes at RD 1000's Pumping Plant Nos. 1B, 6, and 8, which are within the limits of work for the proposed action, will be raised to cross the levee above the new 0.005 AEP water surface design. All pumping plants will require new discharge pipes and some additional modifications to accommodate the new criteria and levee improvements. The existing pumps will require modification or replacement to allow similar performance after the levee improvements and pipe raising. To mitigate for levee underseepage potential, relief wells and channel modifications to the pumping plant intake channels will be required. As design evaluations continue and the design is refined, additional modifications could be required to maintain the plant's current operations, such as adding relief wells and lining the intake channel with either filter gravel or rock-covered geotextile fabric. In addition, relocating the pump stations may be necessary to accommodate the adjacent levee footprint.

Pumping Plant No. 1B - Pumping Plant No. 1B, located along Garden Highway approximately 1 mile west of Interstate 5 (I-5) and immediately adjacent to the landside levee toe in Reach 19B, consists of six pumps, a control-room building, and associated infrastructure for the pumping plant. Each pump for Pumping Plant No. 1B connects to a buried 48-inch discharge pipe that runs across the existing levee to an outfall structure on the east bank of the Sacramento River. Six air/siphon release valves, one for each pipe, are located close to the crown of the levee in a vault on the waterside of the levee. A metering vault is located on the landside of the levee. The pumping-plant modifications will include raising and replacing the discharge pipes that extend from Pumping Plant No. 1B across the levee within the confines of the planned levee construction to tie into the existing discharge pipes on the waterside. The air/siphon release valves will be replaced and shutoff valves will be added. The valves will be constructed in a new concrete vault in the waterside shoulder of the levee. The metering vault along with the plant access ramp may also be replaced or relocated. The pumps and motors will also be replaced and/or upgraded to account for the higher head associated with the raised discharge pipes.

To facilitate raising of the pump discharge pipes, Garden Highway will require a local raise of several feet in grade over the pipes. The road raise will transition back down to existing grade upstream and downstream of the local raise. This work will require partial regrading of the waterside slope for the length of the raised Garden Highway. The levee will transition upstream and downstream of this site from an adjacent levee to a raise of the existing levee in place. The levee at this site will require degrade and reconstruction with engineered fill.

Modification to Pumping Plant No. 1B will disturb 0.02 acre of waterside woodlands. This area will be converted to 0.02 acre of developed area.

Pumping Plant No. 6 - Pumping Plant No. 6 is located along the NEMDC, approximately three-quarters of a mile north of Elkhorn Boulevard. An excavated intake channel connects to the pumping plant. Four pumps, a control-room building, and associated infrastructure for the pumping plant are located immediately adjacent to the landside levee toe. Each pump for

Pumping Plant No. 6 connects to a buried discharge pipe that crosses the existing levee and connects to an outfall structure on the NEMDC. These pipes consist of one 42-inch pipe, two 36-inch pipes, and one 30-inch pipe. Four air/siphon release valves, one for each pipe, are located close to the NEMDC on the waterside of the levee.

The pumping-plant modifications will include raising and replacing the discharge pipes that extend from Pumping Plant No. 6 across the levee to tie into the existing discharge pipes within the waterside of the levee. The air/siphon release valves will be replaced and shutoff valves will be added. The valves will be constructed in a concrete vault in the waterside shoulder of the levee.

An upgrade to and/or replacement of the pumps, motors, and the electrical service including a new electrical building for Pumping Plant No. 6 will be required to provide the increased horsepower needed to pump over the levee. Use of new pumps could require the excavation of a deeper sump, which may require some associated modifications to the landside intake channel. To facilitate raising of the pump discharge pipes, East Levee Road will require a local raise in grade over the pipes. The road raise will transition back down to existing grade upstream and downstream of the local raise. This work will require partial regrading of the waterside slope for the length of the raised East Levee Road. The levee will transition upstream and downstream of this site from an adjacent levee to a raise of the existing levee in place. The levee at this site will require degrade and reconstruction with engineered fill. Traffic control measures and detours will be required during pipe removal and replacement under East Levee Road.

The pipe raise will require a new outfall to comply with the Corps siphon recovery limits criteria, which limit the distance from the top of the apex of the pipe to the top of the outlet pipe. Construction of a new outfall structure will require dewatering a portion of the NEMDC.

Modification to Pumping Plant No. 6 will disturb 0.86 acre of annual grassland, 0.06 acre of canals or ditches, and 0.04 acre of marsh. This area will be converted to 0.90 acre of developed area and 0.06 acre of canal.

Pumping Plant No. 8 - Pumping Plant No. 8 is located along the NEMDC, approximately two-thirds of a mile north of I-80. An excavated intake channel is located on the west side of Northgate Boulevard, and nine pumps and an equipment building are located immediately adjacent to the pump station on the west side of Northgate Boulevard. Each pump for Pumping Plant No. 8 connects to a buried discharge pipe that runs across the existing levee to an outfall structure on the NEMDC. There are a total of nine pipes, including five 54-inch pipes, three 36-inch pipes, and one 60-inch pipe. Nine air/siphon release valves, one for each pipe, are located close to the NEMDC on the waterside of the levee.

The pumping-plant modifications will include raising and replacing the discharge pipes that extend from Pumping Plant No. 8 across the levee to tie into the existing discharge pipes within the waterside bench. The air/siphon release valves will be replaced and shutoff valves will be added. The valves will be constructed in a concrete vault in the waterside shoulder of the levee.

The pumps will also be replaced and/or upgraded to account for the higher head associated with the raised discharge pipes.

An upgrade to and/or replacement of the pumps, motors, and the electrical service including a new electrical building for Pumping Plant No. 8 will be required to provide the increased horsepower needed to pump over the levee. Use of new pumps could require the excavation of a deeper sump, which may require some associated modifications to the landside intake channel. To facilitate raising of the pump discharge pipes, the existing bike trail will require a local raise in grade over the pipes. The trail raise will transition back down to existing grade upstream and downstream of the local raise. This work will require partial regrading of the waterside slope for the length of the raised bike trail. The levee at this site will require degrade and reconstruction with engineered fill. A detour or closure of the bike trail will be required for up to 30 days. Likewise, the pipes will need to be replaced under Northgate Boulevard.

The pipe raise will require a new outfall to comply with the Corps siphon recovery limits criteria, which limit the distance from the top of the apex of the pipe to the top of the outlet pipe. Construction of a new outfall structure will require dewatering a portion of the NEMDC.

Modification to Pumping Plant No. 8 will disturb 0.29 acre of annual grassland, 0.45 acre of canals or ditches, and 0.39 acre of marsh. This area will be converted to 0.68 acre of developed area and 0.45 ace of canal.

City of Sacramento Sump Pumps

The City of Sacramento owns and operates several storm drainage sump pumps to pump residential and urban stormwater out of the Basin. Under the new levee performance criteria, the discharge pipes are required to cross the levee above the new 0.005 AEP design water surface. Therefore, the discharge pipes will be raised and additional modifications will be made to bring all of the pumping plants into compliance with the new criteria. As design evaluations continue and the design is refined, additional modifications could be required to maintain the City Sump 102's current operations. In addition, relocating the pump stations away from the levee may be necessary to accommodate the adjacent levee footprint. The Corps will review any pump station relocations and reinitiate section 7 consultation with the Service if the relocations may affect federally listed species.

City Sump 160 (Sacramento River East Levee Reach A:19B) - City Sump 160 is located along Reach 19B of the Sacramento River east levee. A 90-inch storm drain carries stormwater drainage from adjacent properties to the pump station. A chain link fence with slats and barbed wire is located approximately 30 feet from the landside toe of the levee and, combined with a concrete block wall, surrounds the pump station. Five pumps, an equipment building, an above-ground diesel fuel storage tank, and electrical transformers are located behind the fence. Each pump for City Sump 160 connects to a buried steel discharge pipe that runs across the existing levee to an outfall structure on the Sacramento River. There are a total of five pipes, including two 54-inch pipes, two 42-inch pipes, and one 12-inch pipe. Five air/siphon release valves, one

for each pipe, are located on the landside of the levee near the top. A concrete pipe support wall is located approximately 100 feet from the outfall on the waterside of the levee.

The pumping-plant modifications will include raising the discharge pipes that extend from City Sump 160 across the levee to tie into the existing discharge pipes on the waterside. The air/siphon release valves will be replaced and shutoff valves will be added. The valves will be constructed in a concrete vault in the waterside shoulder of the levee. If necessary, the concrete pipe support wall will be removed and replaced. An upgrade to the pumps and diesel engines for City Sump 160 will likely be required to provide the increased horsepower needed to pump drainage water through the raised pipes.

To facilitate raising of the pump discharge pipes, Garden Highway will require a local raise in grade over the pipes. The road raise will transition back down to existing grade upstream and downstream of the local raise. This work will require partial regrading of the waterside slope for the raised Garden Highway. The levee will transition upstream and downstream of this site from an adjacent levee to a raise of the existing levee in place. The levee at this site will require degrade and reconstruction with engineered fill.
The pipe raise will require a new outfall to comply with the Corps siphon recovery limits criteria, which limit the distance from the top of the apex of the pipe to the top of the outlet pipe. Construction of a new raised outfall structure will require dewatering a portion of the Sacramento River.

Modification to City Sump 160 will disturb 0.03 acre of seasonal wetland and 0.28 acre of waterside woodlands. This area will be converted to 0.31 acre of developed area.

City Sump 58 (American River North Levee) - City Sump 58 is located along the American River North Levee approximately 0.4 mile east of Truxel Road. A 30-inch storm drain carries stormwater drainage from adjacent properties to the pump station. A chain link fence with slats and barbed wire is located at the landside toe of the levee and surrounds the pump station. Three pumps, an equipment building, trash rack hoist, and electrical transformer are located immediately adjacent to the landside levee toe. Each pump for City Sump 58 connects to a buried discharge pipe that runs across the existing levee to an outfall structure on the NEMDC. There are three pipes, including two 20-inch pipes and one 12-inch pipe. Three air/siphon release valves, one for each pipe, are located close to Garden Highway on the landside of the levee. A concrete cutoff structure located within the pipe trench surrounding the pipes is located on the waterside of the levee.

The pumping-plant modifications will include replacing the discharge pipes that extend from City Sump 58 across the levee to tie into the existing discharge pipes on the waterside. The cutoff structure will be removed. The air/siphon release valves will be replaced and shutoff valves will be added. The valves will be constructed in a concrete vault in the waterside shoulder of the levee. An upgrade to the pumps, motors, and the electrical service for City Sump 58 will be required to provide the increased horsepower needed to pump through the raised pipes.

To facilitate raising of the pump discharge pipes, Garden Highway will require a local raise in grade over the pipes. The road raise will transition back down to existing grade upstream and downstream of the local raise. This work will require partial regrading of the waterside slope for the length of the raised Garden Highway. The levee at this site will require degrade and reconstruction with engineered fill.

The pipe raise will require a new outfall to comply with the Corps siphon recovery limits criteria, which limit the distance from the top of the apex of the pipe to the top of the outlet pipe. Construction of a new raised outfall structure will require dewatering a portion of the low-flow channel of the NEMDC within the American River floodway.

In addition, this pump station may need to be relocated as a seepage and stability mitigation measure because of the proximity of the pumps to the toe of the levee. Any landward shift in the levee toe will impact City Sump 58. The reconstructed City Sump 58 will consist of a cast-in-place concrete sump, with a trash rack and operating deck. An enclosure building will be provided to house the electrical, control, and monitoring equipment. The existing storm drain will need to be modified. Related infrastructure, such as access roads and utilities that serve City Sump 58 and are located within the levee footprint, will be relocated outside the footprint.

Modification to City Sump 58 will disturb 0.08 acre of waterside woodlands. This area will be converted to 0.08 acre of developed area.

City Sump 102 (Natomas East Main Drainage Canal at Gardenland Park) - City Sump 102 is located along the NEMDC west levee adjacent to Gardenland Park north of Bowman Avenue. A 60-inch storm drain carries stormwater drainage from adjacent properties to the pump station. A chain link fence with slats and barbed wire is located at the landside toe of the levee and surrounds the pump station. Four pumps, trash rack hoist, electrical transformer, and an equipment building are located immediately adjacent to the landside levee toe. Each pump for City Sump 102 connects to a buried discharge pipe that runs across the existing levee to an outfall structure on the NEMDC. There are four pipes, including three 36-inch pipes and one 12-inch pipe. Four air/siphon release valves, one for each pipe, are located on the waterside of the levee near the top of the levee.

The pumping-plant modifications will include replacing the discharge pipes that extend from City Sump 102 across the levee to tie into the existing discharge pipes within the waterside bench. The air/siphon release valves will be replaced and shutoff valves will be added. The valves will be constructed in a concrete vault in the waterside shoulder of the levee. An upgrade to the pumps, motors, and the electrical service for City Sump 102 will be required to provide the increased horsepower needed to pump through the raised pipes.

To facilitate raising of the pump discharge pipes, the bike trail will require a local raise in grade over the pipes. The trail raise will transition back down to existing grade upstream and downstream of the local raise. This work will require partial regrading of the waterside slope for the length of the raised bike trail. The levee will transition upstream and downstream of this site

from an adjacent levee to a raise of the existing levee in place. The levee at this site will require degrade and reconstruction with engineered fill.

The pipe raise will require a new outfall to comply with the Corps siphon recovery limits criteria, which limit the distance from the top of the apex of the pipe to the top of the outlet pipe. Construction of a new raised outfall structure will require dewatering a portion of the NEMDC.

In addition, this pump station may need to be relocated as a seepage and stability mitigation measure because of the proximity of the pumps to the toe of the levee. Any landward shift in the levee toe could also require relocation of City Sump 102. The reconstructed City Sump 102 will consist of a cast-in-place concrete sump, with a trash rack and operating deck. An enclosure building will be provided to house the electrical, control, and monitoring equipment. The existing storm drain will need to be modified. Related infrastructure, such as access roads and utilities that serve City Sump 102 and are located within the levee footprint, will be relocated outside the footprint.

Modification to City Sump 102 will disturb 0.09 acre of annual grassland and 0.11 acre of canals or ditches. This area will be converted to 0.09 acre of disturbed area and 0.11 acre of canal.

Bank Protection and Other Waterside Improvements

Erosion repair and rock slope protection are required at locations where erosion around the outfall structures penetrating the PGCC and NEMDC levees has been observed. Additional remediation to protect against damage caused by beavers and burrowing animals is needed along the PGCC west levee and the NCC south levee, from State Route (SR) 99 to Howsley Road. Finally, a portion of the low-flow channel of the NEMDC will reconstructed.

Bank Protection

Along the PGCC and NEMDC, six erosion sites have been identified for levee slope erosion repair, placement of rip rap, and/or channel realignment. All of the locations are at the confluences of tributary streams where the channel of PGCC or NEMDC has migrated to the west and threatens or has damaged the right levee. These include four sites along the PGCC west bank (at Curry Creek, Pleasant Grove Creek, Howsley Road Bridge, and Pierce-Roberts Drain) and two sites along the NEMDC west bank (at Dry Creek and Arcade Creek). As described below, bank protection will be constructed along the PGCC (Reach E) and NEMDC South (Reach H) to address the waterside erosion sites.

The bank protection areas on the west bank of the PGCC at Curry Creek, Pleasant Grove Creek, and Pierce-Roberts Drain range from 300–400 feet in length. At Curry Creek and Pleasant Grove Creek, riprap will be placed on the west levee waterside slopes opposite the confluences with Curry and Pleasant Grove Creeks, extending from the waterside toe to the top of slope for about 50 feet upstream and 100 feet downstream of the confluences. The rock will likely be covered with soil and grass. Riprap armoring will also occur opposite the outlet of the Pierce-Roberts Drain. Rock or other protection will be placed along the Howsley Road Bridge embankment and

along the landside of the PGCC west levee near the Howsley Road gap to prevent erosion from undermining the gap or affecting the landslide slope. Investigations are ongoing to determine if riprap should be placed around the left (west) abutment of the Howsley Road Bridge.

The linear extent of the proposed protection on the west bank of the NEMDC at the confluence with Dry Creek is approximately 2,500 feet. Proposed protection will include rock fill to bring the waterside bench up to existing grade, a rock blanket to stabilize the existing 2:1 bank slope below the bench, and a blanket of rock on the waterside toe to help minimize scour (launchable toe). The linear extent of the proposed protection on the west bank of the NEMDC at the confluence with Arcade Creek is approximately 400 feet. Proposed protection will include a variable width bench, a rock riprap blanket on the slope, and a launchable toe.

Erosion repair at six sites along the PGCC and NEMDC will disturb 2.52 acres of developed areas such as homes, roads, and other infrastructure, 3.35 acres of annual grassland, 1.09 acres of canal or ditch, and 6.12 acres of marsh. These areas will be converted to 13.08 acres of developed area.

Beaver Exclusion Wall

The PGCC west levee and the NCC south levee between SR 99 and Howsley Road also experience a significant problem with beavers and other burrowing animals. To provide low-maintenance mitigation for this concern, a beaver exclusion wall will be constructed in these areas. The wall will be constructed of reinforced concrete or steel or vinyl sheet piling, and will be located at the waterside levee toe at a distance of about 50 feet from the levee centerline. The top of the wall will be located above the ordinary high water mark, and the bottom of the wall will reach as deep as 20 feet. The wall will be completely submerged in the levee.

Modification to the PGCC west levee and NCC south levee to create a beaver wall will disturb 0.57 acre of developed areas such as homes, roads, and other infrastructure, 17.28 acres of annual grassland, 2.05 acres of marsh, and 0.37 acre of stream. This area will be converted to 20.27 acres of developed area.

Low-Flow Channel Restoration

The NEMDC low-flow channel beneath and downstream of I-80 has been disturbed by the City of Sacramento Pump Station 157 outfall structure. The outfall has caused the low-flow channel to meander towards the west (right) bank of the channel, which could eventually weaken the existing NEMDC west levee. To fix this problem, the low-flow channel will be reconstructed at the middle of the channel. This reconstruction will be accomplished by creating a diversion for the existing stream flow, filling the existing low-flow channel, and excavating a new low-flow channel. The total length of the channel realignment will be about 1,000 feet. A rock berm will be placed between the low-flow channel and Sump 157 to minimize the impact of the pump station discharge on the west levee.

Natomas Cross Canal Bridge Remediation at State Route 99

The undersides of the SR 99 bridges over the NCC will be affected by high river stages in a flood event. The southern abutment for both bridges is supported by the NCC south levee. The Phase 4b Project includes the construction of a moveable barrier system or a stop log gap at the south end of the SR 99 bridges to be used at high river stages to prevent overflow from reaching the landside of the NCC south levee. The bridge deck connections to the supporting piers and abutments will be modified as needed to resist uplift pressure during high water stages and additional seepage remediation, consisting of seepage cutoff walls where the bridges cross the NCC south levee (Reach D:6), will be installed.

Providing closure at SR 99 will entail constructing a removable barrier that will be stored off-site and installed across the roadway on the south side of the bridge when the NCC stage reached a pre-established elevation. To support the removable barrier, a permanent structure constructed at and adjacent to the highway will be constructed. The permanent support system will tie into levee raising work completed as part of the Phase 2 Project.

Underseepage mitigation at the bridges will be provided by a SCB cutoff wall constructed by the Deep-Mix Method (DMM) through the highway road section, The cutoff wall will be constructed through the centerline of the levee through the SR 99 roadway section to a depth of up to 95 feet.

Modification to the SR 99 bridges will disturb 0.76 acre of developed areas such as homes, roads, and other infrastructure, 0.92 acre of annual grassland, and 0.69 acre of canals or ditches. This area will be converted to 2.37 acres of developed area.

Reclamation of Borrow Sites

The South Fisherman's Lake, Triangle Properties Borrow Area, and the West Lakeside School Site are areas that have been identified as sources of soil borrow for construction of the Phase 4b Project. However, additional borrow sites already described in the biological assessments for the Phase 3 and 4a Projects, including the Fisherman's Lake Borrow Area, Krumancher Borrow Site, and the Twin Rivers Unified School District Stockpile Site, may be utilized if the borrow sites are not able to supply all of the required fill material. Borrow material will be excavated from primarily agricultural lands that either are currently fallow or produce row or field crops. These sites may also contain scattered rural housing, drainage and irrigation features, and woodlands. The excavation limits on the borrow sites will provide a minimum buffer of 50 feet from the edge of the borrow site boundary. However in areas with adjacent drainage features the borrow sites grading may extend into the canal bank with a new patrol road constructed along the top of bank. From the property line boundary setback, the slope from existing grade down to the bottom of the excavation will be no steeper than 3H:1V. After excavation, disturbed areas will be finish graded in compliance with criteria for drainage of reclaimed land uses. Excavated soils not used for borrow material, such as the organic surface layer or soils considered unsuitable for levee construction, will be stockpiled and re-spread on-site after excavation. For areas planned to be returned to agricultural use, approximately 1 foot of topsoil will be removed and stockpiled for reuse during reclamation of the site. Sites will be reclaimed for use and either returned to

agriculture or used for detention basin creation in the Triangle Properties Borrow Area. Revegetation activities will include erosion control on excavated slopes (i.e., hydroseeding), application of fertilizer, and seeding.

Fisherman's Lake Borrow Area, Krumenacher Borrow Site, and the Twin Rivers Stockpile Site

The 469-acre Fisherman's Lake Borrow Area consists of multiple parcels beginning at Powerline Road and extending south to and beyond Radio Road. Impacts associated with use of the Fisherman's Lake Borrow Area were addressed in the Phase 4a Project BA.

The 118-acre Krumenacher Borrow Site and the Twin Rivers Stockpile Site are located south of Elkhorn Boulevard, adjacent to the NEMDC South west levee. Impacts associated with use of these areas as a borrow source and stockpiling area were addressed in the Phase 3 Project BA.

Triangle Properties Borrow Area

The 1,808-acre Triangle Properties Borrow Area consists of multiple parcels along the east levee of the PGCC extending west toward the Union Pacific Railroad line. Existing land uses include developed, pasture, orchard, field crops, and rice cultivation. Some undeveloped lands in the Triangle Properties Borrow Area contain vernal pool habitat; these areas will not be used for borrow operations. Approximately 143 acres of the Triangle Properties Borrow Area will be available for excavation of borrow material. This area is currently in rice cultivation. Borrow activities would not remove the area from production for longer than once season. The areas excavated for borrow material will be reclaimed as rice. The Corps will place a conservation easement on half of the total area used for borrow.

South Fisherman's Lake Borrow Area

The 269-acre South Fisherman's Lake Borrow Area is located north and south of San Juan Road and east of the Sacramento River east levee. Existing land use is agricultural production of field crops. A small portion of the site is comprised of unimproved roads and irrigation ditches. Approximately 267 acres of the South Fisherman's Lake Borrow Area will be available for excavation of borrow material. The areas excavated for borrow material will be reclaimed as agricultural land.

West Lakeside School Site

The 43-acre West Lakeside School Site is located north of Del Paso Road and east of the West Drainage Canal/ Fisherman's Lake. Existing land use is agricultural production of field crops. A small portion of the site is comprised of unimproved roads and irrigation ditches. Approximately 42 acres of the West Lakeside School Site will be available for excavation of borrow material. The areas excavated for borrow material will be reclaimed as agricultural land.

Habitat Enhancement, Development, and Management

Several Phase 4b Project components involve the replacement and/or creation of habitat for listed species, including: landside woodland, the construction of the relocated West Drainage Canal, the creation of managed marsh at the Brookfield Property (or another ServiceUSFWS-approved location), the creation of managed grasslands on the newly constructed levee slopes, seepage berms, access rights-of-ways, canal embankments, and the preservation and establishment of landside woodlands along the Sacramento River east levee in Reach A:16, east of the NEMDC, and along Lower Dry Creek. The construction of the West Drainage Canal is described above in more detail. Refer to the *Mitigation and Monitoring Plans for Phases 2 and 3, Natomas Levee Improvement Program, Landside Improvements Project* document for a more complete summary of the strategy for creating, enhancing, preserving, protecting, and managing habitats in the Natomas Basin in perpetuity. A draft Mitigation and Management Plan (MMP) for Phase 4a is in review by the Corps, Service, and California Department of Fish and Game (CDFG). A Programmatic Long-Term Management Plan (LTMP) for all phases of the Project has been developed and approved by the Corps, Service, and CDFG. As the compensatory habitat components are developed, site-specific management plans and associated easements and management agreements are being created and incorporated into the LTMP.

Canal Habitat Enhancement

The West Drainage Canal will be enhanced to provide improved habitat for GGS. Bank slopes will be flattened reducing bank erosion and associated water quality problems. Besides flattening to a 3H:1V slope, bank improvements will include creating a 2- to 10-foot-wide submerged bench with tule growth to prevent aquatic weeds such as water primrose from attaching to the bank and then expanding across the canal water surface. Bank width will vary depending upon site constraints. Tule benches will provide cover for GGS as well as a source of prey.

The western portion of the West Drainage Canal, which is discussed above in more detail under the "Major Irrigation and Drainage Infrastructure Modifications" section, will be relocated farther away from the Airport operations area in an effort to lessen the canal's potential as a wildlife attraction hazard for Airport operations. The realigned section of the canal will have a bottom width of up to 30 feet, stable 3H:1V bank slopes on one or both sides, and a narrow, variable width bench on one side of the canal. A 20-foot-wide maintenance and inspection road will flank each side of the canal and will be slightly elevated above adjacent land to improve an all-weather road condition.

The West Drainage Canal will continue to be managed for drainage function, as culverts will cross under the patrol road to allow continued drainage into the canal from adjacent fields. The West Drainage Canal will be maintained and operated in the same manner as the Lower GGS/Drainage Canal as described in the Site Specific Management Plan (SSMP).

Giant Garter Snake Habitat/Managed Marsh Complex

To compensate for adverse project effects on GGS habitat, 94.36 acres of managed marsh will be created within the Brookfield borrow site that is currently in rice production, and the adjacent Chappell Ditch and Drain will be improved. The site, which is located in the eastern portion of the Natomas Basin, south of Howsley Road and east of SR 99, will provide managed marsh in an area that is dominated by rice cultivation. As a component of the Phase 2 Project, approximately 160 acres of the 200-acre site was excavated to about 5 feet below existing grade to supply borrow material for NCC south levee improvements and about 80 acres had a conservation easement placed on it and will be left in rice in perpetuity. The Corps will also create managed marsh on this acreage.

In Phase 4b, the Brookfield Borrow Site will be finish graded and planted with native marsh vegetation by the project proponent to create approximately 174.63 acres of managed marsh complex (including approximately 30–40 percent upland and 60–70 percent wetland habitats) that will benefit the GGS. This habitat, consisting of open-water channels, freshwater marshes, and upland plant communities, will provide GGS with basking areas, vegetative cover from predators, and foraging habitat. After establishment of the managed marsh complex, the Corps and SAFCA will grant a conservation easement to and enter into a stakeholder-specific management agreement with TNBC, ensuring the permanent protection and management of these sites as habitat and open space.

Managed Marsh Creation

About 94.36 acres of managed marsh habitat will be created on cultivated rice fields at the Brookfield property (or another Service-approved borrow location). The marsh will consist of a mosaic of aquatic and upland habitats, and an upland buffer between the restoration sites and adjacent roads. This created marsh will maximize habitat edge transitions to provide for shorter distances between burrow, basking, and foraging areas.

Design of the GGS marsh will follow the templates established by TNBC on recent projects and experience with the design, construction, and management of the Airport System's Willey mitigation site in the northeast part of the basin and its existing marsh mitigation project at Prichard Lake. These design templates feature a combination of uplands and shallow water bodies, sinuosity of swales, and water control structures to manage target water levels at different times of the year. The marsh will have perimeter fences to control and protect grazing animals, such as goats. Grazing by goats is a management technique successfully used to reduce invasions of weedy thatch and exotic plants while retaining sufficient cover for GGS and other semi-aquatic species that rely on grassy uplands adjoining the wetland ponds. A firm, reliable water supply consisting of good water quality throughout the GGS's active season of April–October will be procured for the site.

The Brookfield property is adjacent to NCMWC's Chappell Ditch and RD 1000's CH1 Drain. Drainage improvements are proposed as part of the borrow site marsh design, which will improve drainage and irrigation to the Brookfield site. Currently, the Brookfield site's water

supply comes from on-site wells, some of which are located within the footprint of the PGCC levee improvements. To provide irrigation to the site following the marsh creation and to eliminate the need to replace all of the on-site wells, the Chappell Ditch and CH1 Drain will be widened and extended to provide surface water to the Brookfield marsh and adjacent rice fields to the south and east. The side slopes will be graded at a 3:1 slope which will require less maintenance of the canal and more aquatic GGS habitat. This improvement will be designed to provide irrigation to approximately 940 acres formerly supplied by groundwater irrigation wells.

General Construction Plan for the Managed Marsh Complex

The excavation limits for the borrow sites will be a minimum of 50 feet from the edge of the site boundary. From this setback, the slope from existing grade down to the bottom of the excavation will be no steeper than 3H:1V. After excavation, disturbed areas will be finish graded to allow creation of the marsh complex. Finish grading and installation of operational facilities and habitat features will take place from August through October.

Excavated soils that were not used for borrow material in Phase 2, such as the 1-foot-deep organic surface layer or soils considered unsuitable for levee construction, were stockpiled and will be re-spread on-site after excavation. Soil graded back into the site will result in a finish grade elevation somewhat higher than the final design grades. The borrow-site excavation operations will use water for dust control and to maintain proper moisture content in the borrow material. Any excess groundwater generated during temporary dewatering activities will be discharged into adjacent irrigation and drainage canals after application of appropriate water quality best management practices (BMPs). Revegetation activities will include erosion control on excavated slopes (e.g., straw mulch, hydroseeding), application of fertilizer as needed, and seeding of an initial cover crop on the finish grade of the bottom of the borrow site. Marsh plantings will then be installed and the borrow site flooded. It is anticipated that no unsuitable soil material will be hauled off-site. Debris encountered during excavation will be hauled off-site.

The Chappell Ditch and CH1 Drain will be upgraded for approximately 5,000 feet from SR 99 east and extended east to the PGCC and south along the PGCC for approximately 6,500 feet, making the total length of improvements approximately 11,500 feet. The Chappell Ditch will have 3H:1V side slopes, a bottom width of 18 feet, a depth of 6 feet, and two 15-foot-wide access roads, one on each embankment. The Chappell Drain, which provides drainage for agricultural fields to the north, will have 3H:1V side slopes, a bottom width of 12 feet, and variable depth. The construction footprint varies in width from 90 to 165 feet, plus a 20-foot temporary construction easement on each side.

Other construction components are as follows:

- **Maintenance and access roads.** All-weather roads up to 15 feet wide will be constructed away from the open-water channels and between the upland areas in 25-foot-wide maintenance access areas.

- **Water supply and control facilities.** An essential component of the managed marsh complex will be procurement of a firm, reliable water supply and good water quality throughout the GGS's active season (i.e., April–October). A well to provide a backup source of water will be installed in a location where it could supply water to the network of channels if it is needed to replace or supplement the surface-water supply. Water control facilities, such as riser boards, will be installed at key points in the channels to allow maintenance of desired water levels.

- **Habitat features for giant garter snake.** At points along the channels, clusters of rocks will be installed above the water line to provide basking areas for the snakes. Tule benches will be planted between upland areas and the channels to provide cover for the snakes.

Managed Grassland on Levee Slopes, Seepage Berms, and Rights-of-Way

The proposed levee improvements will result in landside slopes that are less steep than the existing slopes, and several reaches of the Sacramento River east levee will have adjoining 100- to 300-foot-wide earthen seepage berms with a nearly flat slope (50H:1V or less). Parallel to the landside toe of enlarged levees and seepage berms will be maintenance setbacks, gravel access roads, utility corridors, as well as relief wells in some locations. Additional setback bufferland (sometimes composed of woodland corridors, canal corridors, or field crops) will flank some of these features, and property acquisition for the proposed action may leave the project proponent with remnant portions of acquired parcels that are nonessential to flood control uses. With the exception of the crown of the levee and the seepage berm access road, these areas will be managed as native perennial grassland. Most grassland will be mowed or grazed throughout the growing season, with an emphasis on mowing procedures and stubble height that optimize these areas for Swainson's hawk foraging habitat as described in the . This management regime will be in accordance with Corps and state guidelines for levee inspection. Longterm management of the grassland in Phase 4b will be included in the managed grassland SSMP and the Corps will review reinitiate section 7 consultation with the Service if management may affect federally listed species. However, the primary purpose and management priority of levees and seepage berms will continue to be flood damage reduction, for which RD 1000 has principal management and maintenance responsibility.

The forthcoming Phase 4b MMP will include methods to create the grasslands, including native-grass mixes that will be seeded along new levee slopes and seepage berms, staging areas, and adjacent maintenance and utility rights-of-way. An initial baseline assessment of managed grassland sites will be conducted after the initial seeding program, and then a monitoring program with performance criteria will be developed to determine the progress of the grassland habitats and to assess the need for adaptive management.

Landside Woodlands

Under the proposed action, woodlands consisting of native riparian and valley oak woodland species, including elderberry shrubs will be planted within a 10-acre area along Reach A:16 of the Sacramento River east levee and up to 60 acres along Lower Dry Creek C. Lower Dry Creek,

a 420-acre open space area located north of Main Avenue and east of the NEMDC, consists of Hansen Park, owned by the City of Sacramento, and the Coyle Property, which is owned by SAFCA. SAFCA has a conservation easement on Hansen Park (the western portion of the Lower Dry Creek area), and a conservation easement could also be placed on the Coyle property to the east. Existing woodland corridors along Dry Creek channels will be preserved, and additional woodland will be created by filling in gaps and widening these existing riparian corridors. Opportunities to create new woodland corridors may be available on historic stream channels that the creek has migrated away from over time. Created woodland will be designed to avoid vernal pools, seasonal wetlands, and relatively permanent water.

Groves will generally be at least 50 feet wide and several hundred feet long, depending on location constraints. Portions of the created woodlands will be at least 100 feet wide to promote successful nesting by a variety of native birds deeper within the grove canopy. At maturity, stand structure will vary from closed-canopy woodland to valley oak savanna vegetation types, with a native perennial grassland understory.

Planting sites will require suitable soil conditions, irrigation water during a 3- to 5-year establishment phase, reduced risk of wildfire, and minimal depth to seasonally high groundwater or other natural water sources to sustain trees once irrigation ceases. To provide irrigation water, groundwater wells will likely need to be drilled in the vicinity of the plantings.
A mixture of native riparian and woodland species will be planted, but the predominant species will be valley oak, the primary tree species that will be affected by the proposed improvements to the Sacramento River east levee; and cottonwood, which is a preferred nest tree for Swainson's hawks in the Basin and is faster growing than valley oak. Establishing woody vegetation will likely require more than one technique, including planting nursery stock, live cuttings, and acorn planting in winter, sustained by flood irrigation, drip, or agricultural-scale spray heads. The woodland planting areas will also accommodate trees and elderberry shrubs that will be removed from existing groves to make way for the proposed flood damage reduction system features and transplanted. Taking into account predictable and unavoidable mortality within the first 8 years of establishment, the intent is to have an average planted tree survival rate of 65 percent, transplanted tree survival rate of 60 percent, and a relative canopy cover of 35 percent. Wherever possible, groves will be bordered by restricted-access public lands and rights-of-way to reduce the risk of vandalism and other inappropriate uses that may threaten wildlife values or risk wildfires from human sources.

The forthcoming Phase 4b MMP will identify performance criteria that will be used to determine the progress of the woodland habitats. The criteria for measuring performance will be used to determine if the conservation component is trending toward sustainability (reduced human intervention) and to assess the need for adaptive management (e.g., changes in design or maintenance revisions).

Creation of the woodland corridor in Reach 16 and woodland groves near lower Dry Creek will disturb 50 acres of annual grassland and 10 acres of row and field crop. This areas will be converted to 60 acres of woodland.

Conservation Measures

Vernal Pool Crustaceans

The following measures shall be implemented to avoid, minimize, and compensate potential adverse effects on vernal pool crustaceans including the vernal pool fairy shrimp and the vernal pool tadpole shrimp:

- Worker awareness trainings for construction personnel shall be conducted by a qualified biologist approved by the Service before the commencement of construction activities and as needed when new personnel begin work on the project. The program shall inform all construction personnel about the life history and status of vernal pool crustaceans, measures to avoid and minimize impacts on this species and its habitat, the conditions of relevant regulatory permits, and the possible penalties for not complying with these requirements. Written documentation of the training shall be submitted to the Service within 30 days of the completion of training.
- All vernal pool crustacean habitat that is located adjacent to construction areas, but can be avoided, shall be protected through establishment of a fenced avoidance area. The 250-foot buffers shall be clearly identified by staking or flagging and high-visibility fencing shall be placed around sensitive habitat. This fencing shall prevent the encroachment of construction personnel and vehicles and protect vernal pool crustacean habitat. Suitable habitat for federally listed vernal pool crustaceans will be avoided at the Triangle Properties Borrow Area and the Lower Dry Creek woodland planting area.
- No insecticides, herbicides, or other chemicals that might harm vernal pool crustacean shall be used within 250 feet of the suitable habitat.
- Dirt roadways and disturbed areas within 250 feet of suitable habitat for vernal pool crustaceans shall be watered at least twice a day to minimize dust emissions.
- If loss of potential habitat occurs it will be compensated for at a Service-approved mitigation bank, at a preservation ratio of 2:1 and a creation ratio of 1:1.

Valley Elderberry Longhorn Beetle

The following measures shall be implemented to avoid, minimize, and compensate potential adverse effects on valley elderberry longhorn beetle:

- Prior to the commencement of construction of the proposed project, surveys shall be conducted for elderberry shrubs throughout the action area. The Corps shall re-initiate formal consultation with the Service if additional elderberry shrubs are found.
- Worker awareness trainings for construction personnel shall be conducted by a qualified biologist approved by the Service before the commencement of construction activities and as needed when new personnel begin work on the project. The program shall inform all construction personnel about the life history and status of the beetle, the need to avoid damaging the elderberry plants, measures to avoid and minimize impacts on this species and its habitat, the conditions of relevant regulatory permits, and the possible penalties for

not complying with these requirements. Written documentation of the training shall be submitted to the Service within 30 days of the completion of training.

- All elderberry shrubs that are located adjacent to construction areas, but can be avoided, shall be protected through establishment of a fenced avoidance area. The high visibility fencing shall be placed at least 20 feet from the dripline of the shrubs, unless otherwise approved by the Service. This fencing shall prevent the encroachment of construction personnel and vehicles and protect the shrubs.
- No insecticides, herbicides, or other chemicals that might harm the beetle or its host plant shall be used within 100 feet of the elderberry shrubs.
- Dirt roadways and disturbed areas within 100 feet of elderberry shrubs shall be watered at least twice a day to minimize dust emissions.
- Elderberry shrubs that require removal shall be transplanted to the woodland corridors and woodland restoration/creation areas. If areas of suitable habitat to be created as part of the proposed action will not be available before the impact will occur, alternative transplantation locations (e.g., TNBC preserves, NLIP woodland corridors) shall be identified and provided to the Service for their approval.
    - If feasible, based on Service authorization, elderberry shrubs shall be transplanted when the plants are dormant (November through the first 2 weeks of February) to increase the success of transplanting. If it is not feasible to transplant elderberry shrubs during their dormant season, compensation will be increased by 2.5 times. Transplantation will not occur during the beetle's flight season (March 15–June 15). A qualified biologist shall be available to monitor transplanting activity.
    - Elderberry shrubs to be transplanted shall be cut back 3 to 6 feet from the ground or to 50% of their height (whichever is taller) by removal of branches and stems. The trunk and all stems measuring 1 inch in diameter or greater at ground level that are removed shall be replanted. All leaves on the shrubs shall be removed.
    - Shrubs shall be removed with a truck-mounted hydraulic tree spade, backhoe, front-end loader, or other suitable equipment. When a shrub is being excavated, as much of the root ball as possible shall be removed and replanted immediately at the mitigation site. Care shall be taken to ensure that the soil is not dislodged from the root ball. Typically, the transplant hole is first excavated by the tree spade and deep-watered. Then the shrubs are transplanted with the same tree spade and immediately transported to the planting hole.
    - The planting area shall be at least 1,800 square feet (0.04 acre) for every transplanted elderberry shrub. In this 1,800-square-foot area, associated tree and shrub species for each elderberry shrub shall also be planted. The root ball shall be planted so that the top is level with the existing ground and the soil shall be compacted so that settlement is minimized.
    - A watering basin measuring at least 3 feet in diameter with a continuous berm (approximately 8 inches wide at the base and 6 inches high) shall be constructed around each transplanted elderberry shrub. Upon completion of planting, soil shall be saturated with water. No fertilizers or other

supplements or paint shall be used on the shrubs. The frequency of watering shall be determined based on soil conditions present at the mitigation site. Either a drip irrigation system or watering truck shall be used to provide water to the site.

- Each elderberry stem measuring 1 inch or greater in diameter at ground level that is adversely affected (i.e., transplanted) shall be replaced with elderberry seedlings and seedlings of associated species, in accordance with the Service's Conservation Guidelines (USFWS 1999). Elderberry seedlings or cuttings shall be replaced at ratios ranging from 1:1 to 8:1 (new plantings to affected stems), depending on the diameter of the affected elderberry stems and the presence of beetle exit holes. Native plants shall be planted, in association with the replacement elderberry shrub seedlings or cuttings, at 1:1 (for shrubs without evidence of beetle exit holes) or 2:1 (for shrubs with evidence of beetle exit holes) ratios. Stock of seedlings and/or cuttings shall be obtained from local sources. Table 1 lists the number of elderberry stems that will be affected and the proposed compensation plantings.
- An MMP and LTMP shall be prepared and implemented. These plans shall specify how the woodland/elderberry habitat creation areas will be managed to ensure that the appropriate habitat conditions are provided. The plans shall, at a minimum, describe requirements for transplantation of shrubs that require removal; specify the number of replacement elderberry shrubs and associated native plants to be established and associated success criteria; specify remedial measures to be undertaken if mitigation success criteria are not met; and describe short- and long-term maintenance and management. Long-term protection of the planting area for elderberry and associated species, and funding for its management, shall be provided through appropriate mechanisms to be determined by the Corps, Service, and other entities cooperating in implementation of the proposed action. The plan shall be reviewed and approved by the Service prior to implementation.

Table 1. Elderberry Stem Sizes and Compensation

Location	Stems (maximum diameter at ground level)	Exit Hole on Shrub (Yes or No)	Elderberry Seedling Ratio	Associated Native Plant Ratio	Number of Stems Observed	Required Elderberry Plantings	Required Associated Native Plant Plantings
Non-riparian	stems ≥1" & ≤3"	No	1:1	1:1	33	33	33
		Yes	2:1	2:1	25	50	100
Non-riparian	stems > 3" & <5"	No	2:1	1:1	4	8	8
		Yes	4:1	2:1	9	36	72
Non-riparian	stems > 5"	No	3:1	1:1	2	6	6
		Yes	6:1	2:1	8	48	96
Total replacement plantings						181	315
Total Elderberry shrubs to be transplanted						10	
496 /10 = 49.6 valley elderberry longhorn beetle credits or 2.05 acres							

Giant Garter Snake

The following measures shall be implemented to avoid, minimize, and compensate potential adverse effects on GGS:

- Worker awareness trainings for construction personnel shall be conducted by a qualified biologist approved by the Service and CDFG before commencement of construction activities and as needed when new personnel begin work on the project. The program shall inform all construction personnel about the life history and status of the snake, the need to avoid damaging suitable habitat and causing snake mortality, measures to avoid and minimize impacts on this species and its habitats, the conditions of relevant regulatory permits, and the possible penalties for not complying with these requirements. Written documentation of the training shall be submitted to the Service and CDFG within 30 days of the completion of training.
- Construction activities and ground-disturbing activities other than those discussed in the following bullet within 200 feet of suitable aquatic habitat for the GGS shall not commence before May 1, with initial ground disturbance expected to correspond with the snake's active season (as feasible in combination with minimizing disturbance of nesting Swainson's hawks). Construction shall be completed by October 1.
- Some components of the proposed project may occur prior to the beginning of the defined GGS active season. Activities, such as utility relocations, and removal of residential or agricultural structures, will be conducted before May 1, typically farther than 200 feet from suitable aquatic habitat for GGSs or in habitat unsuitable for estivation.
- Some components of the proposed action may occur beyond the end of the defined GGS active season of all construction years. Major levee construction (site grading, compacting, etc.) begun in the summer months must halt no later than October 1 of each construction year. Some other activities such as demobilization and site restoration (e.g., hydroseeding, gravelling), may extend past October 1. The project proponent also acknowledges that unanticipated construction delays could occur and result in the need to extend construction work into the GGS inactive season. Should construction need to occur in snake habitat outside of the active season the Corps will notify the Service and CDFG by August 15 to reinitiate consultation. Further, the project proponent recognizes that it may be necessary to implement additional avoidance and minimization measures for project activities that occur beyond October 1.
- Any aquatic habitat for the snake that is dewatered shall remain dry for at least 15 consecutive days after April 15 and before excavating or filling of the dewatered habitat. If complete dewatering is not possible, potential snake prey (e.g., fish and tadpoles) shall be removed so that snakes and other wildlife are not attracted to the construction area.
- Within 24 hours before the commencement of ground-disturbing activities, areas within 200 feet of suitable aquatic habitat for GGS shall be surveyed for GGS by a qualified biologist. The biologist shall provide the Service with written documentation of the monitoring efforts within 48 hours after the survey is completed. The action area shall be re-inspected by a qualified biologist whenever a lapse in construction activity of 2 weeks or greater has occurred. A qualified biologist shall be present on-site during initial

ground disturbance activities. The biologist shall be available throughout the construction period and shall conduct weekly monitoring visits to ensure avoidance and minimization measures are being properly implemented.

- Before the commencement of construction activities, high-visibility fencing shall be erected to protect suitable GGS habitat that is located adjacent to construction areas, but can be avoided, from encroachment of personnel and equipment. The fencing shall be inspected before the start of each work day and maintained by SAFCA and construction personnel until completion of the project. The fencing shall be removed only when the construction within a given area is completed. This fencing shall conform to the specifications detailed in the measure below.
- Tightly woven fiber netting (mesh size less than 0.25 inch) or similar material shall be used for erosion control and other purposes at the project site to ensure that GGS are not trapped or become entangled by the erosion control material. Coconut coir matting is an acceptable erosion control material. No plastic mono-filament matting shall be used for erosion control. The edge of the material shall be buried in the ground to prevent GGS from crawling underneath the material. Erosion control structures shall be constructed so runoff shall be directed away from sensitive habitats, directing water flow into existing drainages or disperse water across vegetated areas to avoid concentrating water.
- The number of access routes, the number and size of staging areas, and the total area of the proposed project activity shall be limited to the minimum necessary. Routes and boundaries shall be clearly demarcated. Movement of heavy equipment to and from the project site shall be restricted to established roadways and designated staging areas to minimize habitat disturbance. Project-related vehicles shall observe a 20-mile-per-hour speed limit within construction areas, except on county roads and on state and Federal highways.
- All snakes encountered shall not be harassed, harmed, or killed and shall be allowed to leave the construction area on their own volition. If any snake is observed retreating into an underground burrow within the project limits, no construction shall be allowed within a 50-foot radius of the burrow. A 50-foot radius nondisturbance buffer zone shall be established until a qualified biologist can make a determination that the snake is or is not a GGS. If a qualified biologist determines that a GGS has retreated into an underground burrow within the project limits, and the area of the burrow cannot be avoided by the project, then under the approval, supervision and direction of the Service and a qualified biologist, the burrow shall be excavated to allow personnel with appropriate authority to capture and handle the GGS to relocate the GGS outside of the action area. The biologist shall notify the Service immediately if any listed species are found on-site, and shall submit a report, including date(s), location(s), habitat description, and any corrective measures taken to protect the species found.
- During construction operations, stockpiling of construction materials, portable equipment, vehicles, and supplies shall be restricted to the designated construction staging areas. All heavy equipment, vehicles, and supplies shall be stored at the designated staging area at the end of each work period.
- To eliminate an attraction to predators of the GGS, all food-related trash items, such as wrappers, cans, bottles, and food scraps, shall be disposed of in closed containers.

- After construction activities are complete, any temporary fill or construction debris shall be removed and temporarily disturbed areas restored to their preproject conditions. An area subject to "temporary" disturbance includes any area that is disturbed during the project, but that, after project completion, shall not be subject to further disturbance and has the potential to be revegetated. All GGS habitats subject to temporary ground disturbances, including storage and staging areas and temporary roads, shall be restored. These areas shall be recontoured, if appropriate, and revegetated with appropriate native plant species to promote restoration of the area to preproject conditions. Appropriate methods and plant species used to revegetate such areas shall be determined on a site-specific basis in consultation with the Service and CDFG and in accordance with the Service's *Guidelines for the Restoration and/or Replacement of Giant Garter Snake Habitat.*
- The Corps shall maintain and monitor temporarily disturbed areas of GGS habitat for 1 year following the completion of construction and restoration activities. Monitoring reports documenting restoration of these areas shall be submitted to the Service upon the completion of the restoration implementation and 1 year after the restoration implementation. Monitoring reports shall include photo-documentation and shall describe when restoration was completed, what materials were used, specified plantings, and justifications of any substitutions to the Service-recommended guidelines.
- Unavoidable adverse effects to GGS habitat shall be compensated through the creation and preservation of suitable aquatic and upland habitat for this species.

Evaluation under Programmatic Consultation for Vernal Pool Crustaceans

This letter is an agreement by the Service to append the proposed project to the Vernal Pool Programmatic Opinion, and represents the Service's biological opinion on the effects of the proposed action. By appending the project to the vernal pool programmatic the Corps acknowledges and accepts all of the conservation measures outlined within the vernal pool programmatic, including, but not limited to, the measures to minimize adverse impacts. The Corps will also follow all reasonable and prudent measures, and all terms and conditions as directed by the programmatic.

The proposed project will result in direct effects to 0.3 acre of habitat for vernal pool crustaceans. The agreed upon conservation responsibilities of the applicant are as follows:

1. Prior to the start of construction, the project applicant will purchase vernal pool preservation credits sufficient to preserve 0.6 acre (0.3 acre at a 2:1 ratio = 0.6 acre) at a Service-approved vernal pool crustacean conservation bank(s) with a service area covering the project. Proof of purchase of these credits shall be provided to the Service and the Corps before groundbreaking occurs for the proposed project.

2. Prior to the start of construction, the project applicant will purchase vernal pool creation credits sufficient to restore/create 0.3 acre (0.3 acre at a 1:1 ratio = 0.3 acre) at a Service-approved vernal pool crustacean conservation bank(s) with a service area covering the

project. Proof of purchase of these credits shall be provided to the Service and the Corps before groundbreaking occurs for the proposed project.

Jeopardy Determination

In accordance with policy and regulation, the jeopardy analysis in this BO relies on four components: (1) the *Status of the Species*, which evaluates the valley elderberry longhorn beetle's vernal pool crustaceans', and GGS's range-wide condition, the factors responsible for that condition, and their survival and recovery needs; (2) the *Environmental Baseline*, which evaluates the condition of the valley elderberry longhorn beetle, vernal pool crustaceans, and GGS in the action area, the factors responsible for that condition, and the relationship of the action area to the survival and recovery of the valley elderberry longhorn beetle, vernal pool crusaceans, and GGS; (3) the *Effects of the Action*, which determines the direct and indirect impacts of the proposed federal action and the effects of any interrelated or interdependent activities on the valley elderberry longhorn beetle, vernal pool crustaceans, and GGS; and (4) the *Cumulative Effects*, which evaluates the effects of future, non-Federal activities in the action area on the valley elderberry longhorn beetle, vernal pool crustaceans, and GGS.

In accordance with policy and regulation, the jeopardy determination is made by evaluating the effects of the proposed Federal action in the context of the valley elderberry longhorn beetle's, vernal pool crustaceans', and GGS's current status, taking into account any cumulative effects, to determine if implementation of the proposed action is likely to cause an appreciable reduction in the likelihood of both the survival and recovery of the valley elderberry longhorn beetle, vernal pool crustaceans and GGS.

The jeopardy analysis in this BO places an emphasis on consideration of the range-wide survival and recovery needs of the valley elderberry longhorn beetle, vernal pool crustaceans, and GGS and the role of the action area in the survival and recovery of the valley elderberry longhorn beetle, vernal pool crustaceans and GGS as the context for evaluating the significance of the effects of the proposed Federal action, taken together with cumulative effects, for purposes of making the jeopardy determination.

Status of the Species

The status of the species for the valley elderberry longhorn beetle and GGS is incorporated by reference from the programmatic BO (pages 45-50 and 54-60).

Environmental Baseline

The environmental baseline for the valley elderberry longhorn beetle and GGS is incorporated by reference from the programmatic BO (page 50-54 and 61-62).

Effects of the Proposed Action

Vernal Pool Fairy Shrimp and Vernal Pool Tadpole Shrimp

The proposed project will directly affect listed crustaceans inhabiting a total of 0.3 acre of vernal pool crustacean habitat. Direct effects of this project are due to the filling of seasonal wetlands for the construction of the proposed levee improvements. During construction, vernal pool crustaceans and cysts will be crushed, buried, or otherwise destroyed.
In addition to the adverse effects above, the proposed project will contribute to a local and range-wide trend of habitat loss and degradation, the principal reasons that the vernal pool fairy shrimp and vernal pool tadpole shrimp population numbers have declined. The proposed project will contribute to the fragmentation and reduction of the acreage of the remaining listed vernal pool crustacean habitat located in Sacramento and Sutter Counties and throughout the range of these two listed vernal pool crustaceans.

The applicant has proposed to offset the effects on the listed vernal pool crustaceans inhabiting the 0.3 acre of suitable habitat that will be directly affected by the proposed project by purchasing preservation and creation credits at a Service-approved conservation bank(s). Contributing to the long-term preservation and management of the vernal pool habitat is critical for the species' survival and recovery.

Valley Elderberry Longhorn Beetle

The proposed project will result in the transplantation, outside of the action area, of the 10 elderberry shrubs within the action area with stems greater than 1.0 inch in diameter. The 10 shrubs affected shrubs have 58 stems between 1 and 3 inches, 13 stems between 3 and 5 inches and 10 stems greater than 5 inches at ground level.

Loss of an elderberry shrub or even a stem can affect valley elderberry longhorn beetle breeding and feeding because adult valley elderberry longhorn beetles rely solely on elderberry foliage and flowers for food and must lay their eggs on elderberry stems to successfully reproduce.

Transplantation of elderberry shrubs that are or could be used by beetle larvae is expected to adversely affect the beetle. Valley elderberry longhorn beetle larvae may be killed or the valley elderberry longhorn beetles' life cycle interrupted during or after the transplanting process. For example:

1. Transplanted elderberry shrubs may experience stress or become unhealthy due to changes in soil, hydrology, microclimate, or associated vegetation. This may reduce their quality as habitat for the valley elderberry longhorn beetle, or impair their production of habitat-quality stems in the future.

2. Elderberry shrubs may die as a result of transplantation.

3. Branches containing larvae may be cut, broken, or crushed as a result of the transplantation process.

Temporal loss of habitat may occur. Although conservation measures for effects on the valley elderberry longhorn beetle will involve creation or restoration of habitat, it generally takes five or more years for elderberry plants to become large enough to support beetles, and it may take 25 years or longer for riparian habitats to reach their full value. Temporal loss of habitat may cause fragmentation of habitat and isolation of subpopulations.

Habitat creation and transplantation of the shrubs will minimize the effect of permanent and temporary habitat loss on the valley elderberry longhorn beetle. Success of a restoration sites has been linked to presence of transplanted elderberry shrubs that have served to colonize a newly created riparian habitat. Transplants also provide an older larger shrubs within the plantings of young small elderberry seedlings that are planted as compensation. Elderberry shrubs will be transplanted and seedlings planted within the 10-acre woodland corridor that the Corps is constructing within the project area. This corridor will be managed in perpetuity for riparian habitat including valley elderberry longhorn beetle habitat, through the site specific management plan.

Giant garter snake

Phase 4b construction includes levee rehabilitation along Sacramento River east levee reaches 16-20, slope flattening and seepage remediation along American River north levee reaches 1-4, levee raising and seepage remediation along the PGCC west levee and NEMDC west levee, improvements to irrigation and drainage infrastructure, bank protection along PGCC and NEMDC, culvert remediation along the PGCC and detention basins, NCC bridge remediation at SR 99, creation of managed marsh at Brookfield borrow site, woodland corridor creation along reach 16 and along Lower Dry Creek, and land acquisitions. Construction during this phase will occur in 83.06 acres of developed land; 181.27 acres of annual grassland; 81.97 acres of row crop, field crop, and fallow agriculture; 4.16 acres of orchard; 86.16 acres of rice; 26.25 acres of canals, ditches, and marsh; 0.41 acre of seasonal wetlands or riverine wetlands; and 35.91 acres of landside and waterside woodland. At the end of construction for Phase 4b the proposed land cover types will be 157.06 acres of developed land; 60 acres of created woodland; 206.46 acres grassland (levee slope grassland); and 75.78 acres of canals and ditches. The newly created cover-types from the project will be protected from future development through either a flood control easement, conservation easement, or drainage easement.

Components of Phase 4b work that will occur outside of the GGS's active season include utility relocation, removal of residential or agricultural structures, and transplantation and planting of trees and elderberry shrubs. These will be conducted before April 15. GGS have been observed to overwinter as far as 250 meters from aquatic habitat (Wylie *et.al* 1997). Given that GGS are generally inactive during the winter months, SAFCA's working during the inactive season will kill GGS that may be overwintering within the construction footprint. To reduce disturbing and/or killing GGS that may be overwintering in uplands that will be affected by working out of season, SAFCA has proposed to place exclusionary fencing, which will be erected prior to

October 1 in areas in which GGS may overwinter and SAFCA is proposing to remove/plant trees or elderberries. The fencing will exclude GGS from entering the area where SAFCA will be constructing during the winter. This fence will be monitored daily prior to and during construction to insure that there are no breaches that a snake could get through. Excluding snakes from these areas will affect the GGS by limiting its ability to utilize suitable upland habitat for winter hibernation and by changing its dispersal behavior. Increased construction activity in areas where GGS are known to occur could expose snakes to increased risks of injury and mortality from predation, exposure, vehicular traffic, and construction equipment. It may be forced to disperse through and/or around the construction sites in response to habitat changes and seasonal indicators at a time when snakes are slower moving due to temperatures. Areas that are unlikely to have overwintering GGS include areas which have active construction or agricultural activities occurring on them.

The remainder of the project will be constructed during the active period (May 1 – October 1) for the snake, resulting in a decreased risk of direct mortality of snakes and construction within any given area will be completed in one construction season, minimizing the length of the effects to snakes. Effects to snakes are highly likely given the number of acres affected within Phase 4b and given that work will occur and given that numerous rice fields border the eastern portion of the Natomas basin. Effects will include removal of cover and basking sites and filling or crushing of burrows or crevices due to excavation activities. Snake movements will be obstructed due to construction activities blocking access to aquatic or upland habitat. The large amount of construction equipment and number of workers within the Phase 4b action area will increase the likelihood of running over basking or dispersing snakes. Filling in of aquatic habitat such as rice, marsh and ditches will decrease the prey base for GGS. All of these effects are likely to result in the direct disturbance, displacement, injury, and/or mortality of snakes. Some of these effects will be minimized through the Corps' conservation measures. Much of the work will occur during the snake's active season, which will reduce snake mortality because the snakes will be able to leave or avoid habitat that is undergoing construction. Dewatering habitat prior to working within in it by at least 2 weeks prior to disturbance will facilitate snakes leaving the construction areas. Speed limits along construction roads as well as worker awareness training should minimize vehicles running over basking or dispersing snakes. The Corps will to construct the realigned portion of the West Drainage Canal prior to filling the current alignment and will enlarge the canal and provide increased vegetated habitat for the GGS within the West Drainage Canal. Having RD 1000 maintain the canal in a similar manner to the Lower GGS/Drainage Canal will also provide long-term benefits to snakes in the area, as channel maintenance will be done less frequently and with built in conservation measures that will reduce harm or harassment of GGS. The bench that is included in the design should allow both an area for the snakes to take cover in as well as help provide prey for snakes. Other irrigation improvements such as Riego Road Canal, Vestal Drain, and Morrison Canal all provide more canal habitat then will be affected once construction is completed.

To acquire material for levee work in the northeastern portion of the project area, the Corps will borrow from 143 acres of rice fields in the Triangle Area, outside of the Natomas Basin. Borrow activities will preclude the area from being planted in rice and therefore, reduce the amount of habitat available for GGS. To minimize effects to GGS the Corps will only borrow from any one

area for no more than one growing season and the field will be placed back into production and available to GGS the following season. Additionally, the Corps has proposed to place a conservation easement on half of the total area of rice fields used for borrow. This will provide long term protection to this area and preclude this area from being developed in the future.

The Corps will be removing 86.16 acres of rice when constructing along the NEMDC levee, the PGCC levee, and irrigation canal construction. Additionally 8.63 acres of marsh habitat will be removed primarily during construction of the beaver wall, and erosion repair along the PGCC and NEMDC. To compensate for the loss of habitat, the Corps has proposed to compensate with 94.36 acres of managed marsh with a conservation easement on the Brookfield Borrow Site, which is in rice cultivation.

The Corps will be creating 94.36 acres of managed marsh in the northeastern portion of the Natomas Basin. Creation of marsh within this area will provide long term benefits to the Natomas Basin by permanently protecting and increasing marsh habitat within the Natomas Basin. In addition the canal improvements that the Corps will make at the Chappell Ditch and CH1 Drain will provide improved connectivity of the managed marsh to other locations within the Natomas Basin than currently exists. There will be a loss of aquatic GGS habitat in the form of rice during borrow activities and the construction of the managed marsh. Long term the amount of GGS habitat within the Natomas Basin will be increased and connectivity within the northeastern portion of the basin will be improved, which will offset the effects of the project on the GGS.

Cumulative Effects

The cumulative effects for the GGS have not changed and are incorporated by reference from the amended programmatic BO (pages 68-70).

Conclusion

After reviewing the current status of the vernal pool fairy shrimp, vernal pool tadpole shrimp, valley elderberry longhorn beetle, and GGS, the environmental baseline for the species, the effects of the proposed project, and the cumulative effects on this species, it is the Service's BO that the proposed Natomas Landside Improvements Project Phase 4b, as described herein, is not likely to jeopardize the continued existence of the these species. Although critical habitat has been designated for the vernal pool crustaceans and valley elderberry longhorn beetle, the proposed action will not affect critical habitat.

The Corps and SAFCA have proposed to improve flood protection for the Natomas Basin above what currently exists. Two Habitat Conservation Plans (HCP) currently exist within the Natomas Basin and are based on future development occurring within the permit area of the Metro Air Park Habitat Conservation Plan (MAPHCP) and the NBHCP. The baselines and assumptions for which these HCPs were developed were based on no urban development occurring within the basin outside of these permit areas and landuse practices (primarily agriculture) remaining essentially the same. Sacramento County and the City of Sacramento have been in discussions

with the Service about additional development outside of the existing permit areas. As discussed in the Environmental Baseline, the Natomas Basin has experienced a large amount of rice fallowing both in land held by private farmers and leases terminated on Sacramento County Airport property. While the Service has concluded that the Corps and SAFCA's project will not jeopardize the GGS, it could enable future growth to occur that otherwise will not be allowable but for these actions, which will require additional analysis to determine if this growth could jeopardize any of the 22 species covered by the MAPHCP and NBHCP. However, although future growth in the Natomas Basin outside of the permit area is under discussion, the Service does not consider it to be reasonably foreseeable at this time, as no specific proposals are proposed or under review. If growth outside of the permit areas were to occur within the Natomas Basin, these future projects must have a higher conservation outcome than currently exists in the HCPs and must be closely coordinated with the Service.

INCIDENTAL TAKE STATEMENT FOR PHASE 4B CONSTRUCTION

Section 9 of the Act and Federal regulation pursuant to section 4(d) of the Act prohibit the take of endangered and threatened species, respectively, without special exemption. Take is defined as harass, harm, pursue, hunt, shoot, wound, kill, trap, capture or collect, or to attempt to engage in any such conduct. Harass is defined by the Service as an intentional or negligent act or omission which creates the likelihood of injury to a listed species by annoying it to such an extent as to significantly disrupt normal behavioral patterns which include, but are not limited to, breeding, feeding or sheltering. Harm is defined by the Service to include significant habitat modification or degradation that results in death or injury to listed species by impairing behavioral patterns including breeding, feeding, or sheltering. Incidental take is defined as take that is incidental to, and not the purpose of, the carrying out of an otherwise lawful activity. Under the terms of section 7(b)(4) and section 7(o)(2), taking incidental to and not intended as part of the agency action is not considered to be prohibited taking under the Act, provided that such taking is in compliance with this Incidental Take Statement.

The measures described below are nondiscretionary for listed species in Phase 4b of this opinion and must be implemented by the Corps in order for the exemption in section 7(o)(2) to apply. The Corps has a continuing duty to regulate the activity that is covered by this incidental take statement. If the Federal agency (1) fails to adhere to the terms and conditions of the incidental take statement, and/or (2) fails to retain oversight to ensure compliance with these terms and conditions, the protective coverage of section 7(o)(2) may lapse.

Amount or Extent of Take

Vernal Pool Fairy Shrimp and Vernal Pool Tadpole Shrimp

The Service anticipates incidental take of the listed vernal pool crustaceans will be difficult to detect for the following reasons: (1) these species have small body size, therefore finding a dead or injured specimen is unlikely; (2) these species occur in habitats that makes detection difficult; and (3) losses may be masked by seasonal and annual fluctuations in numbers, chance events, changes in water regime, or additional environmental disturbance. Due to the difficulties in

quantifying the number of individuals that will be taken as a result of the proposed action, the Service is quantifying take incidental to this project as the number of acres of suitable habitat for the vernal pool crustaceans that will become unsuitable for this species as a result of the action. The Service estimates that all vernal pool fairy shrimp and vernal pool tadpole shrimp inhabiting 0.3 acre of vernal pool habitat will be harassed, harmed, injured, or killed, as a result of the levee expansion. The incidental take associated with the proposed action on vernal pool fairy shrimp and vernal pool tadpole shrimp is hereby exempted from prohibitions of take under section 9 of the Act.

Valley Elderberry Longhorn Beetle

The Service expects that incidental take of the valley elderberry longhorn beetle will be difficult to detect or quantify. The cryptic nature of these species and their relatively small body size make the finding of an injured or dead specimen unlikely. The species occurs in habitats that make them difficult to detect. Due to the difficulty in quantifying the number of beetles that will be taken as a result of the proposed action, the Service is quantifying take incidental to the project as the number of elderberry stems one inch or greater in diameter at ground level (beetle habitat) that will become unsuitable for beetles due to direct or indirect effects as a result of Phase 3 construction. Therefore, the Service estimates that all beetles inhibiting 10 elderberry plants containing stems 1 inch or greater at ground level (58 stems between 1-3 inches, 13 stems between 3 and 5 inches and 10 stems $\geq$5 inches; see Table 1 in the text) will become unsuitable as a result of the proposed action.

Giant Garter Snake

The Service anticipates that incidental take of the snake will be difficult to detect or quantify for the following reasons: GGS are cryptically colored, secretive, and known to be sensitive to human activities. Snakes may avoid detection by retreating to burrows, soil crevices, vegetation, or other cover. Individual snakes are difficult to detect unless they are observed, undisturbed, at a distance. Most close-range observations represent chance encounters that are difficult to predict. It is not possible to make an accurate estimate of the number of snakes that will be harassed, harmed or killed during Phase 4b construction activities (staging areas, work on canal banks, soil borrow areas, and vehicle traffic to and from borrow areas). In instances when take is difficult to detect, the Service may estimate take in numbers of individual snakes per acre of habitat lost or affected as a result of the action. Therefore, the Service anticipates that all GGS inhabiting 112.41 acres of aquatic and 263.24 acres of upland habitat may be harassed, harmed, or 3 GGS killed by loss and destruction of habitat due to construction of Phase 4b.

Effect of the Take

The Service has determined that this level of anticipated take is not likely to result in jeopardy to the valley elderberry longhorn beetle or GGS and that the proposed project, as described, fits within the parameters of the level of take anticipated in the vernal pool crustacean programmatic opinion and is not likely to cause an appreciable reduction in the likelihood of both the survival and recovery of the vernal pool crustaceans in the wild.

Reasonable and Prudent Measures

The following Reasonable and Prudent Measures are necessary and appropriate to minimize the effect of the proposed project on the GGS.

1. All conservation measures as described in the biological assessment, and as re-stated here in the Project Description section of this BO, must be fully implemented and adhered to.

2. Effects of harassment of individual GGS within the proposed project, and of the loss or degradation of the species' habitat shall be minimized.

3. Effects of harassment of individual valley elderberry longhorn beetle, and of the loss and degradation of the species' habitat shall be minimized.

Terms and Conditions

In order to be exempt from the prohibitions of section 9 of the Act, the Corps must ensure compliance with the following terms and conditions, which implement the reasonable and prudent measures described above. These terms and conditions are nondiscretionary.

1. The following Terms and Conditions implement Reasonable and Prudent Measure one (1):

    a. The Corps and SAFCA shall minimize the potential for incidental take of vernal pool crustaceans, valley elderberry longhorn beetles, and GGS resulting from the project related activities by implementation of the project description as described in the biological assessment and the project description (pages 2 - 37) of this BO.

    The Corps and SAFCA shall include full implementation and adherence to conservation measures as a condition of any permit issued or contract awarded for the project.

    b. If requested, before, during, or upon completion of ground-breaking and construction activities, the project proponents shall allow access by Service and/or California Department of Fish and Game personnel to the project site to inspect the project for effects to GGS and to determine if the proposed conservation measures are being implemented.

    c. A Service-approved Worker Environmental Awareness Training Program for construction personnel shall be conducted by a Service-approved biologist for all construction workers prior to the commencement of construction activities. As needed, training shall be conducted in Spanish for Spanish language speakers and other languages as needed or necessary.

d. The Corps and SAFCA shall require that all personnel associated with this project are made aware of the conservation measures and the responsibility to implement them fully. This could be accomplished by including a copy of this BO within its solicitations for design and construction of the proposed project and making the primary contractor responsible for implementing all requirements and obligations included within the BO, as well as and educating and informing all other contractors involved in the project as to the requirements of the BO.

e. The Corps shall provide quarterly construction activity updates which include what areas have been under construction, what construction activities have been occurring, estimates on completion dates, and what activities are planned for the next quarter.

2. The following Terms and Conditions implement Reasonable and Prudent Measure two (2):

a. At least 30 calendar days prior to initiating construction activities, the project proponents shall submit the names and curriculum vitae of the biological monitor(s) for the proposed project. Monitors shall have the ability to differentiate GGS from other snakes and the authority to stop construction activities if a snake is encountered during construction until appropriate corrective measures have been completed or until the snake is determined to be unharmed.

b. For Phase 4b work that will occur outside of the GGS active window, (power pole relocations, removal or relocation of residential or agricultural structures, construction of lower GGS/Drainage Canal and portions of Elkhorn Canal, and removal of trees and elderberry shrubs) exclusion fencing shall be placed around upland areas that GGS could use to overwinter prior to October 1. The exclusionary fencing shall be monitored everyday prior to and during construction to ensure that openings do not develop that will allow the entry of a GGS into the construction area.

c. If it appears that any other construction activity may go beyond October 1, the project proponents shall contact the Service as soon as possible, but not later than July 15 of the year in question, to determine if additional measures are necessary to minimize take. Areas that have not had ground breaking occur prior to September 15 shall not work past October 1.

d. The project proponents shall implement Best Management Practices to prevent sediment from entering areas containing snake habitat, including, but not limited to, silt fencing, temporary berms, no cleaning of equipment in or near snake habitat, installation of vegetative strips, and temporary sediment disposal.

e. Runoff from dust control and oil and other chemicals used in other construction activities shall be retained in the construction site and prevented from flowing into

areas containing snake habitat. The runoff shall be retained in the construction areas by creating small earthen berms, installing silt fences or hay-bale dikes, or implementing other measures on the construction site to prevent runoff from entering the habitat of the snake.

f. The biologist shall notify the Service immediately if any listed species are found on-site, and will submit a report, including date(s), location(s), habitat description, and any corrective measures taken to protect the species found. The biologist shall be required to report any take to the Service immediately by telephone at (916) 414-6600 and by electronic mail or written letter addressed to the Division Chief, Endangered Species Program, within one (1) working day of the incident. The project area shall be re-inspected by the monitoring biologist whenever a lapse in construction activity of two weeks or greater has occurred.

g. To the extent feasible, the project proponents shall confine clearing of vegetation and scraping, or digging, of soil to the minimal area necessary to facilitate construction activities.

h. After completion of construction activities, any temporary fill and construction debris shall be removed. A written report regarding restoration of temporarily disturbed sites shall be submitted to the Service within ten (10) working days of the completion of construction at the project site.

i. The Corps and SAFCA shall ensure compliance with the reporting requirements.

3. The following Terms and Conditions implement Reasonable and Prudent Measure three (3):

a. A biological monitor will be present on site when work will encroach on the 20-foot elderberry buffer. The monitor will have the authority to stop construction within 20 feet of the shrub if unauthorized take of the beetle occurs. The monitor shall contact the Service immediately to determine what corrective measures need to be taken.

b. Compensation plantings shall occur within the same year as the transplantation of the elderberry shrubs.

Reporting Requirements

A post-construction compliance report prepared by the monitoring biologists must be submitted to the Deputy Assistant Field Supervisor at the Sacramento Fish and Wildlife Office within thirty (30) calendar days of the completion of construction activity or within thirty (30) calendar days of any break in construction activity lasting more than thirty (30) calendar days. This report shall detail: (i) dates that groundbreaking at the project started and the project was completed; (ii) pertinent information concerning the success of the project in meeting compensation and other

conservation measures; (iii) an explanation of failure to meet such measures, if any; (iv) known project effects on the GGS, if any; (v) occurrences of incidental take of any these species; and (vi) other pertinent information.

The Corps must require SAFCA to report to the Service immediately any information about take or suspected take of federally-listed species not authorized in this BO. SAFCA must notify the Service within 24 hours of receiving such information. Notification must include the date, time, and location of the incident or of the finding of a dead or injured animal. In the case of a dead animal, the individual animal should be preserved, as appropriate, and held in a secure location until instructions are received from the Service regarding the disposition of the specimen or the Service takes custody of the specimen. The Service contact persons are, Division Chief, Endangered Species Program at (916) 414-6600, and the Resident Agent-in-charge of the Service's Law Enforcement Division at (916) 414-6660.

Any contractor or employee who during routine operations and maintenance activities inadvertently kills or injures a listed wildlife species must immediately report the incident to their representative. This representative must contact the CDFG immediately in the case of a dead or injured listed species. The CDFG contact for immediate assistance is State Dispatch at (916) 445-0045.

CONSERVATION RECOMMENDATIONS

Conservation recommendations are suggestions of the Service regarding discretionary measures to minimize or avoid adverse effects of a proposed action on listed species or critical habitat or regarding the development of new information. These measures may serve to further minimize or avoid the adverse effects of a proposed action on listed, proposed, or candidate species, or on designated critical habitat. They may also serve as suggestions on how action agencies can assist species conservation in furtherance of their responsibilities under section 7(a)(1) of the Act, or recommend studies improving an understanding of a species' biology or ecology. Wherever possible, conservation recommendations should be tied to tasks identified in recovery plans. The Service is providing you with the following conservation recommendations:

1. The Corps and SAFCA should assist in the implementation of the draft, and when published, the final Recovery Plan for the GGS.

2. The Corps and SAFCA should provide funding to researchers studying topics identified by the Service in the draft, and when published, the final Recovery Plan for the GGS.

3. The Corps should use environmental restoration authorities to acquire and restore garter snake habitat.

To be kept informed of actions minimizing or avoiding adverse effects or benefiting listed and proposed species or their habitats, the Service requests notification of the implementation of any conservation recommendations.

REINITIATION - CLOSING STATEMENT

This concludes formal consultation with the Corps on the Natomas Levee Improvement Project, Phase 4b. As provided in 50 CFR 402.16, re-initiation of formal consultation is required where discretionary Federal agency involvement or control over the action has been maintained (or is authorized by law) and if: (1) the amount or extent of incidental take is exceeded; (2) new information reveals effects of the proposed action may affect listed species or critical habitat in a manner or to an extent not considered in this opinion; (3) the agency action is subsequently modified in a manner that causes an effect to listed species or critical habitat that was not considered in this opinion; or (4) a new species or critical habitat is designated that may be affected by the proposed action. In instances where the amount or extent of incidental take is exceeded, any operations causing such take must cease pending re-initiation.

If you have any questions regarding this BO on the Natomas Landside Improvements Project Phase 4b, please contact Jennifer Hobbs at (916) 414-6541 or Micelle Tovar, Acting Chief, Sacramento Valley Branch at (916) 414-6645.

Sincerely,

for Susan K. Moore
Field Supervisor

D2 USACE Jurisdictional Determinations

DEPARTMENT OF THE ARMY
U.S. ARMY ENGINEER DISTRICT, SACRAMENTO
CORPS OF ENGINEERS
1325 J STREET
SACRAMENTO CA 95814-2922

REPLY TO
ATTENTION OF

November 17, 2009

Regulatory Division SPK-2009-00238

Lizette Crosbie
Sacramento Area Flood Control Agency
1007 7th Street, 7th Floor
Sacramento, California 95814

Dear Ms. Crosbie:

We are responding to your request for a preliminary jurisdictional determination (JD), in accordance with our Regulatory Guidance Letter (RGL) 08-02, for the Robla Creek site. The approximately 711.01-acre site is located near Dry Creek, east of the Natomas Basin, in Sections 5, 6, 7 and 9 of Township 9 & 10 North, Range 5 East, Latitude 38.66722° North, Longitude -121.46115° West, Sacramento County, California.

Based on available information, we concur with the estimate of potential waters of the United States, as depicted on EDAW's November 5, 2009 drawings *Robla Creek Wetland Delineation – Map 1 & 2* (copies enclosed). The approximately 144.21-acres of wetlands and other water bodies present within the survey area (as depicted on the map and summarized on the table provided on both *Map 1* and *2*) may be jurisdictional waters of the United States. These waters may be regulated under Section 404 of the Clean Water Act.

A copy of our RGL 08-02 Preliminary Jurisdictional Determination Form for this site is enclosed. Please sign and return a copy of the completed form to this office. Once we receive a copy of the form with your signature we can accept and process a Pre-Construction Notification or permit application for your proposed project.

You should not start any work in any potentially jurisdictional waters of the United States unless you have Department of the Army permit authorization, or if you intend to request an approved JD for this site. In certain circumstances, as described in RGL 08-02, an approved JD may later be necessary.

This preliminary determination has been conducted to identify the potential limits of wetlands and other water bodies which may be subject to Corps of Engineers' jurisdiction for the particular site identified in this request. This determination may not be valid for the wetland conservation provisions of the Food Security Act of 1985. If you or your tenant are USDA program participants, or anticipate participation in USDA programs, you should request a certified wetland determination from the local office of the Natural Resources Conservation Service, prior to starting work.

We appreciate your feedback. At your earliest convenience, please tell us how we are doing by completing the customer survey on our website under *Customer Service Survey.*

Please refer to identification number SPK-2009-00238 in any correspondence concerning this project. If you have any questions, please contact Mary Pakenham-Walsh at U.S. Army Corps of Engineers Regulatory Division, California Delta Branch, 1325 J Street, Room 1480, Sacramento, CA 95814-2922, email *Mary.R.Pakenham-Walsh@usace.army.mil*, or telephone 916-557-7718. For more information regarding our program, please visit our website at *www.spk.usace.army.mil/regulatory.html.*

Regulatory Division (SPK-2007-00211)

Sarah Bennett
EDAW, Inc.
2022 J Street
Sacramento, California 95811

Dear Ms. Bennett:

We are responding to your request, on behalf of the Sacramento Area Flood Control Agency, for an approved jurisdictional determination for a portion of the Natomas Levee Improvement Program Landside Improvements Project (NLIP) site. This approximately 5,283-acre site is located in the Natomas Basin in Northern Sacramento and Southern Sutter Counties, California.

Based on available information, we concur with the estimate of waters of the United States, as depicted on your June 4, 2008, revised Maps 1-19. Approximately 212.3 acres of waters of the United States, including wetlands, are present within the survey area. These waters are regulated under Section 404 of the Clean Water Act, since they are tributary and adjacent to navigable waters of the United States, in particular the Sacramento River.

The 7.04 acres of features identified as Field Ditches on the above drawings appear to have been constructed wholly in and drain only uplands. As such, we do not consider these to be waters of the United States. This disclaimer of jurisdiction is only for Section 404 of the Federal Clean Water Act. Other Federal, State, and local laws may apply to activities in these features. In particular, authorization from the California State Water Resources Control Board and/or the U.S. Fish and Wildlife Service may be necessary.

This verification is valid for five years from the date of this letter, unless new information warrants revision of the determination before the expiration date. This letter contains an approved jurisdictional determination for your subject site. If you object to this determination, you may request an administrative appeal under Corps regulations at 33 CFR Part 331.

A Notification of Appeal Process (NAP) fact sheet and Request for Appeal (RFA) form is enclosed. If you request to appeal this determination you must submit a completed RFA form to the South Pacific Division Office at the following address: Administrative Appeal Review Officer, Army Corps of Engineers, South Pacific Division, CESPD-PDS-O, 1455 Market Street, San Francisco, California 94103-1399, Telephone: 415-503-6574, FAX: 415-503-6646.

In order for an RFA to be accepted by the Corps, the Corps must determine that it is complete, that it meets the criteria for appeal under 33 CFR Part 331.5, and that it has been

received by the Division Office within 60 days of the NAP. Should you decide to submit an RFA form, it must be received at the above address by 60 days from the date of this letter. It is not necessary to submit an RFA form to the Division Office if you do not object to the determination in this letter.

You should provide a copy of this letter and notice to all other affected parties, including any individual who has an identifiable and substantial legal interest in the property.

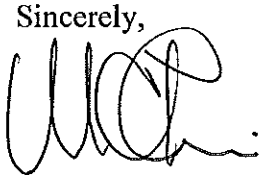
This determination has been conducted to identify the limits of Corps of Engineers' Clean Water Act jurisdiction for the particular site identified in this request. This determination may not be valid for the wetland conservation provisions of the Food Security Act of 1985. If you or your tenant are USDA program participants, or anticipate participation in USDA programs, you should request a certified wetland determination from the local office of the Natural Resources Conservation Service, prior to starting work.

The extent of waters on other portions of the approximately 9,661-acre project site was separately verified under our identification numbers 200300776, 200600332, and 200600795. Based on available information, there are a total of approximately 610 acres of waters of the United States, in the overall NLIP area. This total does not include the Sacramento River itself which is outside of this project site.

We appreciate your feedback. At your earliest convenience, please complete our customer survey at *http://www.spk.usace.army.mil/customer_survey.html*. Your passcode is "conigliaro".

Please refer to identification number SPK-2007-00211 in any correspondence concerning this project. If you have any questions, please contact Mike Finan at our California North Branch , 1325 J Street, Room 1480, Sacramento California 95814-2922, email *michael.c.finan@usace.army.mil*, or telephone (916) 557-5324. You may also use our website: *www.spk.usace.army.mil/regulatory.html*.

Sincerely,



Mike Finan

DEPARTMENT OF THE ARMY PERMIT

Permittee: Grant Joint Union High School District

Permit Number: SPK-2005-01087

Issuing Office: U.S. Army Engineer District, Sacramento
Corps of Engineers
1325 "J" Street
Sacramento, California 95814-2922

NOTE: The term "you" and its derivatives, as used in this permit, means the permittee or any future transferee. The term "this office" refers to the appropriate district or division office of the Corps of Engineers having jurisdiction over the permitted activity or the appropriate official of that office acting under the authority of the commanding officer.

You are authorized to perform work in accordance with the terms and conditions specified below. A notice of appeal options is enclosed.

Project Description:

To place fill material into 1.8734 acres of waters of the United States, including 0.9 acre of stock pond, 0.22 acre of vernal pools, 0.72 acre of seasonal wetland swales and 0.03 acre of jurisdictional drainage ditch for the construction of a joint middle/high school, and associated infrastructure.

All work is to be completed in accordance with the attached plan(s).

Project Location:

South of Elkhorn Boulevard and north of Del Paso Road in Section 36, Township 10 North, Range 4 East, in Sacramento County, California, USGS Topographic Quadrangle Rio Linda; Latitude 38.6770° North, Longitude 121.4903° West.

Permit Conditions:

General Conditions:

1. The time limit for completing the work authorized ends on **May 23, 2013**. If you find that you need more time to complete the authorized activity, submit your request for a time extension to this office for consideration at least one month before the above date is reached.

2. You must maintain the activity authorized by this permit in good condition and in conformance with the terms and conditions of this permit. You are not relieved of this requirement if you abandon the permitted activity, although you may make a good faith transfer to a third party in compliance with General Condition 4 below. Should you wish to cease to maintain the authorized activity or should you desire to abandon it without a good faith transfer, you must obtain a modification of this permit from this office, which may require restoration of the area.

3. If you discover any previously unknown historic or archeological remains while accomplishing the activity authorized by this permit, you must immediately notify this office of what you have found. We will initiate the Federal

and state coordination required to determine if the remains warrant a recovery effort or if the site is eligible for listing in the National Register of Historic Places.

4. If you sell the property associated with this permit, you must obtain the signature of the new owner in the space provided and forward a copy of the permit to this office to validate the transfer of this authorization.

5. If a conditioned water quality certification has been issued for your project, you must comply with the conditions specified in the certification as special conditions to this permit. For your convenience, a copy of the certification is attached if it contains such conditions.

6. You must allow representatives from this office to inspect the authorized activity at any time deemed necessary to ensure that it is being or has been accomplished in accordance with the terms and conditions of your permit.

Special Conditions:

1. To mitigate for the loss of 1.8734 acres of waters of the United States, including 0.9 acre of stock pond, 0.22 acre of vernal pools, 0.72 acre of seasonal wetland swales and 0.03 acre of jurisdictional drainage ditch, you shall purchase 3.9 acre vernal pool creation and 0.2 seasonal wetland creation credits at a Corps approved wetland mitigation bank. Evidence of this purchase shall be provided to this office prior to proceeding with any activity otherwise authorized by this permit. A list of approved mitigation banks has been included for your reference.

2. This Corps permit does not authorize you to take an endangered species, in particular the vernal pool fairy shrimp (*Branchinecta lynchi*), vernal pool tadpole shrimp (*Lepidurus packardi*), or designated critical habitat. In order to legally take a listed species, you must have separate authorization under the Endangered Species Act (e.g., an Endangered Species Act Section 10 permit, or a Biological Opinion under Endangered Species Act Section 7, with "incidental take" provisions with which you must comply). The enclosed Fish and Wildlife Service Biological Opinion, (Number 1-1-0+-F-0294), dated July 25, 2007, and (Number 1-1-07-F-0140, dated April 5, 2007, and the December 18, 2007 revision, contains mandatory terms and conditions to implement and reasonable and prudent measures that are associated with "incidental take" that is also specified in the Biological Opinion. Your authorization under this Corps permit is conditional upon your compliance with all of the mandatory terms and conditions associated with incidental take of the attached Biological Opinion, which terms and conditions are incorporated by reference in this permit. Failure to comply with the terms and conditions associated with the incidental take statement in the Biological Opinion, where a take of the listed species occurs, would constitute an unauthorized take, and it would also constitute non-compliance with your Corps permit. The Fish and Wildlife Service is the appropriate authority to determine compliance with the terms and conditions of its Biological Opinion, and with the Endangered Species Act. You must comply with all conditions of this Biological Opinion.

3. To document pre and post-project construction conditions, you shall submit pre-construction photos of the project site prior to project implementation and post-construction photos of the project site within 30 days after completion of authorized activities.

4. You must allow representatives from the Corps of Engineers to inspect the authorized activity and any mitigation, preservation, or avoidance areas at any time deemed necessary to ensure that it is being or has been accomplished in accordance with the terms and conditions of your permit.

5. You shall employ construction best management practices (BMPs) onsite to prevent degradation to on-site and off-site waters of the U.S. You shall submit photodocumentation of your BMPs to our office within 30 days of commencement of construction. Photos may be submitted electronically to regulatory-info@usace.army.mil.

6. You shall stabilize and protect against erosion any unstable fills in or adjacent to wetlands and other waters of the U.S. by using appropriate erosion controls such as the use of matting, seeding, or other effective methods. The erosion controls shall remain in place until all exposed areas are permanently stabilized.

7. You shall clearly identify the project limits in the field by using survey markers and/or construction fencing, prior to beginning any construction activities to ensure waters of the United States outside of the project footprint are not impacted. Identification of these areas shall be maintained until construction is complete. No heavy equipment or work is permitted in waters of the United States beyond those authorized through this permit.

Further Information:

1. Congressional Authorities: You have been authorized to undertake the activity described above pursuant to:

( ) Section 10 of the Rivers and Harbors Act of 1899 (33 U.S.C. 403).

(X) Section 404 of the Clean Water Act (33 U.S.C. 1344).

( ) Section 103 of the Marine Protection, Research and Sanctuaries Act of 1972 (33 U.S.C. 1413).

2. Limits of this authorization.

a. This permit does not obviate the need to obtain other Federal, state, or local authorizations required by law.

b. This permit does not grant any property rights or exclusive privileges.

c. This permit does not authorize any injury to the property or rights of others.

d. This permit does not authorize interference with any existing or proposed Federal projects.

3. Limits of Federal Liability. In issuing this permit, the Federal Government does not assume any liability for the following:

a. Damages to the permitted project or uses thereof as a result of other permitted or unpermitted activities or from natural causes.

b. Damages to the permitted project or uses thereof as a result of current or future activities undertaken by or on behalf of the United States in the public interest.

c. Damages to persons, property, or to other permitted or unpermitted activities or structures caused by the activity authorized by this permit.

d. Design or construction deficiencies associated with the permitted work.

e. Damage claims associated with any future modification, suspension, or revocation of this permit.

4. Reliance on Applicant's Data. The determination of this office that issuance of this permit is not contrary to the public interest was made in reliance on the information you provided.

5. Reevaluation of Permit Decision. This office may reevaluate its decision on this permit at any time the circumstances warrant.

Circumstances that could require a reevaluation include, but are not limited to, the following:

a. You fail to comply with the terms and conditions of this permit.

b. The information provided by you in support of your permit application proves to have been false, incomplete, or inaccurate (see 4 above).

c. Significant new information surfaces which this office did not consider in reaching the original public interest decision.

Such a reevaluation may result in a determination that it is appropriate to use the suspension, modification, and revocation procedures contained in 33 CFR 325.7 or enforcement procedures such as those contained in 33 CFR 326.4 and 326.5. The referenced enforcement procedures provide for the issuance of an administrative order requiring you comply with the terms and conditions of your permit and for the initiation of legal action where appropriate. You will be required to pay for any corrective measures ordered by this office, and if you fail to comply with such directive, this office may in certain situations (such as those specified in 33 CFR 209.170) accomplish the corrective measures by contract or otherwise and bill you for the cost.

6. Extensions. General Condition 1 establishes a time limit for the completion of the activity authorized by this permit. Unless there are circumstances requiring either a prompt completion of the authorized activity or a reevaluation of the public interest decision, the Corps will normally give favorable consideration to a request for an extension of this time limit.

Your signature below, as permittee, indicates that you accept and agree to comply with the terms and conditions of this permit.

Permittee

May 23, 2008
Date

This permit becomes effective when the Federal official, designated to act for the Secretary of the Army, has signed below.

Kathleen A. Dadey, PhD, Chief,
Sacramento Office
(For the District Engineer)

June 29, 2005

Regulatory Branch (200300776)

Greg Rowe
Sacramento County Airport System
6900 Airport Boulevard
Sacramento, California 95837-1109

Dear Mr. Rowe:

We are responding to your consultant's request for an approved jurisdictional determination for the Sacramento Airport Land Management area. This approximately 2,838-acre site is located on or near the Sacramento River, in Sections 19, 30 & 31, Township 10 North, Range 4 East, and Sections 24, 25 & 36, Township 10 North, Range 3 East, M.D.B.&M., approximate Latitude 38° 41′ 19.7″ & Longitude 121° 35′ 56.7″, Sacramento County, California.

Based on available information and with the exception of the jurisdictional determinations on the map, we concur with the estimate of waters of the United States, as depicted on the **May 5, 2005, SMF LMP Wetland Delineation Maps 1-4** drawings prepared by **EDAW, Inc.** Approximately 27.86 acres of waters of the United States, including wetlands, are present within the survey area. These waters are regulated under Section 404 of the Clean Water Act since they are tributary, or adjacent to a tributary, to the Sacramento River.

You have determined that hydrology for wetlands FM4 and FM5 are solely supported by a "leaky-pipe" and based on Regulatory Branch Memorandum (RBM) 2004-03 the wetlands are not jurisdictional. Although RBM 2004-03 only addressed "leaky-ditch" wetlands, for this case we believe RBM 2004-03 and RBM 2003-04 ("Irrigated" Wetlands) are applicable to this situation. Based on the available information, including topography, we believe there is uncertainty regarding the source of hydrology for these wetlands. In accordance with the above RBMs, we will assume that these wetlands are supported, at least partially, by natural hydrology, unless clearly demonstrated otherwise. Therefore, at this time, we consider these wetlands jurisdictional. If practical, we recommend you consider closing the valve to this pipe and monitoring the hydrology to clearly demonstrate the source of hydrology. Detailed topography and the exact location of the pipe relative to wetlands may also be helpful in determining the source of hydrology.

The wetlands identified as Swales 4, 5 and 9, acreages 0.04, 0.04 and 0.01 respectively, on the above drawings are intrastate isolated waters with no apparent interstate or foreign commerce connection. As such, these waters are not currently regulated by the Corps of Engineers. This disclaimer of jurisdiction is only for Section 404 of the Federal Clean Water Act. Other Federal, State, and local laws may apply to your activities. In particular, you may need authorization from the California State Water Resources Control Board and/or the U.S. Fish and Wildlife Service.

This verification is valid for five years from the date of this letter, unless new information warrants revision of the determination before the expiration date. A *Notification of Administrative Appeal Options and Process and Request for Appeal* form is enclosed. If you wish to appeal this approved jurisdictional determination, please follow the procedures on the form. You should provide a copy of this letter and notice to all other affected parties, including any individual who has an identifiable and substantial legal interest in the property.

This determination has been conducted to identify the limits of Corps of Engineers' Clean Water Act jurisdiction for the particular site identified in this request. This determination may not be valid for the wetland conservation provisions of the Food Security Act of 1985. If you or your tenant are USDA program participants, or anticipate participation in USDA programs, you should request a certified wetland determination from the local office of the Natural Resources Conservation Service, prior to starting work.

Please refer to identification number 200300776 in any correspondence concerning this project. If you have any questions, please contact Justin Cutler at our Sacramento Office, 1325 J Street, Room 1480, Sacramento, California 95814-2922, email *Justin.Cutler@usace.army.mil*, or telephone 916-557-5258. March 21, 2006

Regulatory Branch (200300776)

Tim Hawkins
Associate Environmental Analyst
Department of Environmental Review and Assessment
827 7th Street, Suite 220
Sacramento, California 95814

Dear Mr. Hawkins:

We are responding to your request for an approved jurisdictional determination for the Sacramento International Airport Parcel South of I-5 site. This approximately 300-acre site is located on or near Section 19, 24, 25, 30, 31, 36, Township 10 North, Range 3, 4 East, MDB&M, Latitude 38° 41′ 19.7″, Longitude 121° 35′ 56.7″, Sacramento County, California.

Based on available information, we concur with the estimate of waters of the United States, as depicted on the map included in your February 8, 2006 submittal to Kathleen Dadey of our office. Approximately 3.72 acres of waters of the United States, including wetlands, are present within the survey area. These waters are regulated under Section 404 of the Clean Water Act since they are tributary to the Sacramento River, or adjacent to a tributary of the River.

The water identified as an agricultural ditch in the February 8, 2006 report (shown as a yellow line in the north central portion of the aforementioned map) is an intrastate isolated water with no apparent interstate or foreign commerce connection. As such, this water is not currently regulated by the Corps of Engineers. This disclaimer of jurisdiction is only for Section 404 of the Federal Clean Water Act. Other Federal, State, and local laws may apply to your activities. In particular, you may need authorization from the California State Water Resources Control Board and/or the U.S. Fish and Wildlife Service.

This verification is valid for five years from the date of this letter, unless new information warrants revision of the determination before the expiration date. This letter contains an approved jurisdictional determination for the airport's potential expansion (parking lot). If you object to this verification, you may request an administrative appeal under Corps regulations at 33 CFR Part 331. Enclosed you will find a Notification of Appeal Process (NAP) fact sheet and Request for Appeal (RFA) form. If you request to appeal this verification, you must submit a completed RFA form to the South Pacific Division Office at the following address:

Doug Pomeroy, Administrative Appeal Review Officer
Army Corps of Engineers, South Pacific Division
CESPD-PDS-O
333 Market Street, Room 923
San Francisco, California 94105-2195
Telephone: 415-977-8035
FAX: 415-977-8129

In order for an RFA to be accepted by the Corps, the Corps must determine that it is complete, that it meets the criteria for appeal under 33 CFR Part 331.5, and that it has been received by the Division Office within 60 days of the NAP. Should you decide to submit an RFA form, it must be received at the above address by May 20, 2006. It is not necessary to submit an RFA form to the Division Office if you do not object to the verification in this letter.

You should provide a copy of this letter and notice to all other affected parties, including any individual who has an identifiable and substantial legal interest in the property.

This determination has been conducted to identify the limits of Corps of Engineers' Clean Water Act jurisdiction for the particular site identified in this request. This determination may not be valid for the wetland conservation provisions of the Food Security Act of 1985. If you or your tenant are USDA program participants, or anticipate participation in USDA programs, you should request a certified wetland determination from the local office of the Natural Resources Conservation Service, prior to starting work.

Please refer to identification number 200300776 in any correspondence concerning this project. If you have any questions, please contact Ms. Kathleen Dadey at our Sacramento Office, 1325 J Street, Room 1480, Sacramento, California 95814-2922, email *kathleen.a.dadey@usace.army.mil*, or telephone 916-557-7253. Regulatory Branch (200600332)

Greg Rowe
Sacramento County Airport System
6900 Airport Boulevard
Sacramento, California 95837

Dear Mr. Rowe:

We are responding to your consultant's request for an approved jurisdictional determination for the Sacramento Intl Airport North site. This approximately 900-acre site is located adjacent to the Sacramento River, north of the Sacramento International Airport, in Township 10N, Range 3E, MDB&M, Latitude 38.722, Longitude 121.594, Sacramento County, California.

Based on available information, we concur with the estimate of waters of the United States, as depicted on Exhibit 3, Elverta North Wetland Delineation, dated August 23, 2006 prepared by EDAW, Inc.. Approximately 94.57 acres of waters of the United States, including wetlands, are present within the survey area. These waters are regulated under Section 404 of the Clean Water Act since they are adjacent and/or tributary to the Sacramento River or are adjacent to one of a number of ditches which are tributary to the Sacramento River. The Sacramento River is a navigable water of the United States.

This verification is valid for five years from the date of this letter, unless new information warrants revision of the determination before the expiration date. This letter contains an approved jurisdictional determination for your subject site. If you object to this determination, you may request an administrative appeal under Corps regulations at 33 CFR Part 331. Enclosed you will find a Notification of Appeal Process (NAP) fact sheet and Request for Appeal (RFA) form. If you request to appeal this determination you must submit a completed RFA form to the South Pacific Division Office at the following address: Doug Pomeroy, Administrative Appeal Review Officer, Army Corps of Engineers, South Pacific Division, CESPD-PDS-O, 333 Market Street, Room 923, San Francisco, California 94105-2195, Telephone: 415-977-8035 FAX: 415-977-8129.

In order for an RFA to be accepted by the Corps, the Corps must determine that it is complete, that it meets the criteria for appeal under 33 CFR Part 331.5, and that it has been received by the Division Office within 60 days of the NAP. Should you decide to submit an RFA form, it must be received at the above address by November 28, 2006. It

is not necessary to submit an RFA form to the Division Office if you do not object to the determination in this letter.

You should provide a copy of this letter and notice to all other affected parties, including any individual who has an identifiable and substantial legal interest in the property.

This determination has been conducted to identify the limits of Corps of Engineers' Clean Water Act jurisdiction for the particular site identified in this request. This determination may not be valid for the wetland conservation provisions of the Food Security Act of 1985. If you or your tenant are USDA program participants, or anticipate participation in USDA programs, you should request a certified wetland determination from the local office of the Natural Resources Conservation Service, prior to starting work.

Please refer to identification number 200600332 in any correspondence concerning this project. If you have any questions, please contact at our Sacramento Valley Office, 1325 J Street, Room 1480, Sacramento, California 95814-2922, email kathleen.a.dadey@usace.army.mil, or telephone 916-557-7253. Regulatory Branch (200600795)

John Bassett
Sacramento Area Flood Control Agency
1007 7th Street 7th Floor
Sacramento, California 95814

Dear Mr.:

We are responding to your consultant's request for an approved jurisdictional determination for the Natomas Cross Canal site. This approximately 340.0-acre site is located on or near Sacramento River in Section , Township 11 North, Range 4 East, MDB&M, Latitude 038° 48′ 25.4″, Longitude 121° 33′ 59.4″, Sutter County, California.

Based on available information, we concur with the estimate of waters of the United States, as depicted on the **October 18, 2006, Natomas Cross Canal** drawing prepared by **EDAW**. Approximately **271.22** acres of waters of the United States, including wetlands, are present within the survey area. These waters are regulated under Section 404 of the Clean Water Act since they are **a broad continuum of wetland features adjacent to the Natomas Cross Canal, which is a tributary to the Sacramento River.**

This verification is valid for five years from the date of this letter, unless new information warrants revision of the determination before the expiration date. This letter contains an approved jurisdictional determination for your subject site. If you object to this determination, you may request an administrative appeal under Corps regulations at 33 CFR Part 331. Enclosed you will find a Notification of Appeal Process (NAP) fact sheet and Request for Appeal (RFA) form. If you request to appeal this determination you must submit a completed RFA form to the South Pacific Division Office at the following address: Doug Pomeroy, Administrative Appeal Review Officer, Army Corps of Engineers, South Pacific Division, CESPD-PDS-O, 333 Market Street, Room 923, San Francisco, California 94105-2195, Telephone: 415-977-8035 FAX: 415-977-8129.

In order for an RFA to be accepted by the Corps, the Corps must determine that it is complete, that it meets the criteria for appeal under 33 CFR Part 331.5, and that it has been received by the Division Office within 60 days of the NAP. Should you decide to submit an RFA form, it must be received at the above address by January 7, 2007. It is not necessary to submit an RFA form to the Division Office if you do not object to the determination in this letter.

You should provide a copy of this letter and notice to all other affected parties, including any individual who has an identifiable and substantial legal interest in the property.

This determination has been conducted to identify the limits of Corps of Engineers' Clean Water Act jurisdiction for the particular site identified in this request. This determination may not be valid for the wetland conservation provisions of the Food Security Act of 1985. If you or your tenant are USDA program participants, or anticipate participation in USDA programs, you should request a certified wetland determination from the local office of the Natural Resources Conservation Service, prior to starting work.

Please refer to identification number 200600795 in any correspondence concerning this project. If you have any questions, please contact Tom Cavanaugh at our Sacramento Valley Office, 1325 J Street, Room 1480, Sacramento, California 95814-2922, email *Brian.E.Vierria@usace.army.mil*, or telephone 916-557-7728. Regulatory Division SPK-2008-01039

John Bassett
Sacramento Area Flood Control Agency
1007 7th Street, 7th Floor
Sacramento, California 95814

Dear Mr. Bassett:

We are responding to your consultant's January 13, 2010, request, on your behalf, for a preliminary jurisdictional determination (JD), in accordance with our Regulatory Guidance Letter (RGL) 08-02, for the Natomas Levee Improvement Program *Phase 3 Landside Improvements Project, Supplement to the Phase 3 Landside Improvement Project* and *Phase 4 Landside Improvements Project.* These sites total approximately 2695.4-acres and are located in the Natomas Basin in various Sections in Townships 9, 10 and 11 North and Ranges 4 and 5 East in Sacramento County, California.

Based on available information, we concur with the estimate of potential waters of the United States, as depicted on the September 2008, March 29, 2009 (revised June 15, 2009) and August 12, 2009, respectively, drawings prepared by EDAW. The approximately 290.58 acres of wetlands and 111.92 acres of other water bodies present within the surveyed areas may be jurisdictional waters of the United States. These waters may be regulated under Section 404 of the Clean Water Act.

A copy of our RGL 08-02 Preliminary Jurisdictional Determination Form for this site is enclosed. Please sign and return a copy of the completed form to this office. Once we receive a copy of the form with your signature we can accept and process a Pre-Construction Notification or permit application for your proposed project.

You should not start any work in potentially jurisdictional waters of the United States unless you have Department of the Army permit authorization. You may request an approved JD for these sites at any time prior to starting work within waters. In certain circumstances, as described in RGL 08-02, an approved JD may later be necessary.

A copy of our Notice of Appeal Options form is also enclosed. You should provide a copy of this letter and notice to all other affected parties, including any individual who has an identifiable and substantial legal interest in the property.

This preliminary determination has been conducted to identify the potential limits of wetlands and other water bodies which may be subject to Corps of Engineers' jurisdiction for the particular site identified in this request. A Notification of Appeal Process and Request for Appeal (RFA) form is enclosed to notify you of your options with this determination. This determination may not be valid for the wetland conservation provisions of the Food Security Act of 1985. If you or your tenant are USDA program participants, or anticipate participation in USDA programs, you should request a certified wetland determination from the local office of the Natural Resources Conservation Service, prior to starting work.

We appreciate your feedback. At your earliest convenience, please tell us how we are doing by completing the customer survey on our website under *Customer Service Survey*.

Please refer to identification number SPK-2008-01039 in any correspondence concerning this preliminary jurisdictional determination. If you have any questions concerning this preliminary jurisdictional determination, please contact Michael Finan at Sacramento District Regulatory Division, email *Michael.C.Finan@usace.army.mil*, or telephone 916 557-5324. Otherwise, you may contact me directly. For more information regarding our program, please visit our website at *www.spk.usace.army.mil/regulatory.html*.

Sincerely,

NMFS Letter

UNITED STATES DEPARTMENT OF COMMERCE
National Oceanic and Atmospheric Administration
NATIONAL MARINE FISHERIES SERVICE
Southwest Region
501 West Ocean Boulevard, Suite 4200
Long Beach, California 90802-4213

JAN 8 2009

In response refer to:
2009/01731

Mr. Francis C. Piccola
Chief, Planning Division
U.S. Army Corps of Engineers
1325 J Street
Sacramento, California 95814

Dear Mr. Piccola:

This is in response to your April 2, 2009, letter requesting the initiation of formal section 7 consultation with NOAA's National Marine Fisheries Service (NMFS) pursuant to the Endangered Species Act (ESA) for the proposed Natomas Levee Improvement project, Phases 3 and 4a. Specifically, the U.S. Army Corps of Engineers (Corps) has determined that the implementation of project related activities may have an adverse affect to federally listed endangered Sacramento River winter-run Chinook salmon (*Oncorhynchus tshawytscha*), threatened Central Valley spring-run Chinook salmon (*O. tshawytscha*), threatened Central Valley steelhead (*O. mykiss*), the threatened Southern Distinct Population Segment (DPS) of North American green sturgeon (*Acipenser medirostris*), or their respective designated critical habitat. In addition, the Corps has requested consultation on the impacts of the proposed project to the Essential Fish Habitat (EFH) for Pacific salmon pursuant to provisions of the Magnuson-Stevens Fishery Conservation and Management Act (MSA). This letter also serves as consultation under the authority of and in accordance with the provisions of the Fish and Wildlife Coordination Act (FWCA) of 1934, as amended.

On April 2, 2009, NMFS received a biological assessment from the Corps consultant, EDAW/AECOM, as well as several supporting memorandnms on September 14, 30, and October 1, 2009, respectively. The memorandums addressed the revegetation plan and the Corps Engineering Technical Letter 1110-2-271 (ETL). The Corps, in cooperation with Sacramento Area Flood Control Agency (SAFCA), modified their design plans to meet the Corps ETL. The Corps and SAFCA plan to replace the loss of vegetation on-site at a 1:1 ratio where feasible. Where on-site replacement of vegetation is not feasible, vegetation would be planted at a 3:1 ratio off-site. If it is determined that the area is not large enough to accommodate all of the replacement vegetation necessary for the loss of Shaded Riverine Aquatic (SRA) habitat, SAFCA shall purchase SRA credits at a NMFS approved conservation bank.

Action

The Corps and SACFCA plan to improve the Natomas levee system located in northern Sacramento and southern Sutter Counties. The project area is bordered by the Natomas Cross Canal on the north, the Sacramento River on the west, the American River on the south, and the Pleasant Grove Creek Canal and Natomas East Main Drainage/Steelhead Creek on the east. The general plan for Phase 3 and 4a includes raising the levee from the levee crown with some removal of vegetation on the waterside of the levee slope from the toe to the crown of the levee, constructing a slnrry wall, re-contouring the levee slopes from the landside, and improving the drainage structures on the landside of the levee for wildlife habitat. The activities will result in the loss of 1.986 acres of SRA habitat above the Ordinary High Water Mark (OHWM) and 0.244 acres below the OHWM. Other activities include the installation of a coffer dam with a vibratory hammer in order to rebnild the intake pumps. In-water construction activities for Phases 3 and 4a will occur between July 1 and October 1. The Corps and SAFCA expect the activities behind the coffer dam, as well as its removal, to be completed before October 1. Disturbed areas on the waterside will be restored using biotechnical remediation techniques. Removal of Instream Woody Material (IWM) will be avoided where possible. If the removal of IWM is necessary, the IWM will be replaced. Although some levee grading and minor tree removal will occur below the OHWM, revegetation with native species will be designed to compensate for the temporal loss of riparian vegetation on the water side of the slope. Permanent impacts to riparian vegetation will be replaced at a 1:1 ratio, on-site where feasible. Where on-site replacement is not feasible, vegetation will be planted at a 3:1 ratio off-site. If it is determined that the area is not large enough to accommodate all of the replacement vegetation necessary for the loss of SRA habitat, SAFCA shall pnrchase SRA credits at a NMFS approved conservation bank. During all phases of construction, Best Management Practices (BMP) and conservations measures for erosion control and water quality will be implemented.

ESA Consultation

Based on our review of the information provided in your April 2, 2009, biological assessment and letter requesting the initiation of ESA section 7 consultation, and the September 14, 30, and October 1, 2009 memorandums, NMFS finds that the proposed activities do not require formal section 7 consultation. We have determined that the proposed project is not likely to adversely affect federally listed Central Valley steelhead, endangered Sacramento River winter-run Chinook salmon, threatened Central Valley spring-run Chinook salmon, threatened Southern DPS of North American green sturgeon, or their respective designated critical habitats. This determination is based largely on the fact that in-water construction will be minimal and will occur during a time of the year when sensitive life history stages (rearing or smolting juveniles) of listed fish will not be present in the action area; the project proposal includes using biotechnical remediation designs and techniques for work conducted on the waterside of the levee in order to minimize the loss of ripariau vegetation and replace any lost vegetation with native riparian species; the action includes a fish relocation plan for fish that may become trapped behind the coffer dam, as well as a slurry spill contingency plan to minimize the risk of bentonite slurry entering the aquatic environment; the utilization of a vibratory hammer for the placement of the coffer dam to minimize any potential acoustic effects to listed species; and the implementation of BMPs for water quality and erosion control. Based on the incorporation of

these conservation measures into the project description, NMFS has concluded that potential adverse effects of the proposed project to listed species have been minimized to the point of being discountable or insignificant.

This concludes ESA section 7 consultation for the proposed project. This concurrence does not provide incidental take authorization pursuant to section 7(b) (4) and section 7(o) (2) of the ESA. Reinitiation of consultation is required where discretionary Federal agency involvement or control over the action has been retained (or is authorized by law) and if: (1) new information reveals effects of the action that may affect listed species or critical habitat in a manner or to an extent not previously considered; (2) the action is subsequently modified in a manner that causes an effect to the listed species or critical habitat not considered; or (3) a new species is listed or critical habitat designated that may be affected by the action.

EFH

With regards to EFH consultation, the action area has been identified as EFH for all races of Central Valley Chinook salmon (*O. tshawytscha*), including the fall-/late-fall-run in Amendment 14 of the Pacific Salmon Fishery Management Plan pursuant to the MSA. Federal action agencies are mandated by the MSA [section 305(b)(2)] to consult with NMFS on all actions that may adversely affect EFH, and NMFS must provide EFH conservation recommendations to those agencies [section 305(b)(4)(A)]. Because the proposed project would implement conservation measures which are expected to avoid adverse impacts to Chinook salmon habitat, additional EFH Conservation Recommendations are not being provided at this time, however, if there is substantial revision to the action, the lead Federal agency will need to re-initiate EFH consultation.

FWCA

The purpose of the FWCA is to ensure that wildlife conservation receives equal consideration and is coordinated with other aspects of water resources development [16 U.S.C. 661]. The FWCA establishes a consultation requirement for Federal departments and agencies that undertake any action that proposes to modify any stream or other body of water for any purpose, including navigation and drainage [16 U.S.C 662(a)]. Consistent with this consultation requirement, NMFS provides recommendations and comments to Federal action agencies for the purpose of conserving fish and wildlife resources. The FWCA provides the opportunity to offer recommendations for the conservation of species and habitats beyond those currently managed under the ESA and MSA. Because the proposed project is designed to avoid and minimize environmental impacts to aquatic habitat within the action area, NMFS has no additional FWCA comments to provide.

Please contact Madelyn Martinez at (916) 930-3605, or via e-mail at Madelyn.Martinez@noaa.gov if you have any questions regarding this letter.

Sincerely,

for Rodney R. McInnis
Regional Administrator

D3 Clean Water Act Section 404(b)(1) Evaluation

APPENDIX D3
CLEAN WATER ACT SECTION 404(b)(1) EVALUATION

I. PROJECT DESCRIPTION, PROJECT PURPOSE, AND NEED

The U.S. Army Corps of Engineers (USACE), Sacramento District and the Sacramento Area Flood Control Agency (SAFCA), the local sponsor, propose to construct the Natomas Levee Improvement Program (NLIP), Phase 4b Landside Improvements Project (Phase 4b Project or the project), which consists of levee improvements to the remaining portions of the Natomas Basin's perimeter levee system in the City of Sacramento and in Sutter and Sacramento Counties, California. The overall purpose of the multi-phase NLIP is to bring the entire 42-mile Natomas Basin perimeter levee system into compliance with applicable Federal and state standards for levees protecting urban areas through a program of proposed levee improvements to address levee height deficiencies, levee seepage potential, and streambank erosion conditions along the Natomas Basin perimeter levee system. The Landside Improvements Project, which is a component of the NLIP, consists of four phases (1, 2, 3, and 4a and 4b). For a complete summary of the NLIP phasing, see Chapter 2, "Alternatives," in the Environment Impact Statement/Environmental Impact Report (EIS/EIR). Also, see Section 4.18, "Summary of Environmental Impacts and Mitigation Measures from Previous Natomas Levee Improvement Program Landside Improvements Project Phases 1–4a," in the EIS/EIR for a summary of impacts and mitigation measures associated with the Phase 1–4a Projects.

The Phase 4b Project builds upon a program of improvements analyzed in previous environmental documents for achieving flood risk damage reduction for the 53,000-acre Natomas Basin. The project is the final phase of the Landside Improvements Project and the subject of the EIS/EIR. The proposed improvements consist of levee improvements, associated landscape and irrigation/drainage infrastructure modifications, and habitat creation and management.

A description of all of the alternatives to the Phase 4b Project can be found in Chapter 2, "Alternatives," of the EIS/EIR. The EIS/EIR includes a screening of all of the alternatives considered for analysis, including criteria and rationale for those alternatives carried forward and those alternatives not carried forward in EIS/EIR (see Sections 2.1.5, "Alternatives Considered, But Eliminated from Further Consideration," and 2.1.6, "Alternatives Carried Forward for Evaluation in this EIS/EIR"). This 404(b)(1) analysis focuses on the alternatives carried forward for analysis in the EIS/EIR: the No-Action Alternative, the Adjacent Levee Alternative (Proposed Action), and the Fix-in-Place Alternative.

- **No-Action Alternative**—The expected future without-project conditions.
- **Adjacent Levee Alternative (Proposed Action)**—An adjacent levee would be constructed along the Sacramento River east levee Reach A:16–20; and, where required for this levee, cutoff walls, seepage berms, and relief wells would be installed for seepage remediation. A cutoff wall would be installed in the American River north levee east of Gateway Oaks Drive to Northgate Boulevard, and the landside slope would be flattened. The Natomas East Main Drain Canal (NEMDC) west levee would be raised in place or widened from just south of Elkhorn Boulevard to Sankey Road, and the landside slope would be flattened and seepage remediation would be constructed as necessary. Waterside erosion protection would be constructed in locations along the Pleasant Grove Creek Canal (PGCC) and NEMDC (south of Elkhorn Boulevard). Culverts located beneath the PGCC would be upgraded or removed, and replacement flood storage would be provided as needed. At the State Route (SR) 99 crossing of the Natomas Cross Canal (NCC), seepage remediation would be installed and a moveable barrier system would be constructed to prevent overflow from reaching the landside of the NCC south levee. The western portion of the West Drainage Canal would be realigned to the south, and the remaining portion of the existing canal would be improved to reduce bank erosion and sloughing, decrease aquatic weed infiltration,

improve Reclamation District 1000 (RD 1000) maintenance access, and enhance giant garter snake habitat connectivity. Irrigation canals and ditches would be relocated either to make room for expanded levee sections or to reduce underseepage potential. Discharge pipes for RD 1000 pumping plants and City of Sacramento sump pumps would be raised to cross the levee above design flood water surface elevation. Parcels in the South Fisherman's Lake and Triangle Properties Borrow Areas and at the West Lakeside School Site would be excavated and reclaimed as agricultural land. Woodland groves would be established to compensate for impacts along the Sacramento River east levee Reach A:16–20, American River north levee Reach I:1-4, and NEMDC.

- **Fix-in-Place Alternative**—The Sacramento River east levee would be improved in place in Reach A:16–20 and seepage remediation would be implemented. The Fix-in-Place Alternative would be the same as described for the Adjacent Levee Alternative (Proposed Action) except that the crown of the Sacramento River east levee would not be widened. This type of levee improvement would narrow the overall landside footprint by 15 feet but would require a greater extent of levee degrade to construct cutoff walls and a greater extent of encroachment removal along the Sacramento River east levee compared to the Adjacent Levee Alternative (Proposed Action).

The above three alternatives are described in detail in Chapter 2, "Alternatives," of the EIS/EIR. The Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative were developed for consideration with a focus on improvements to the Sacramento River east levee Reach A:16–20. Phase 4b Project improvements to the American River north levee Reach I:1-4, NEMDC west levee, PGCC west levee, NCC south levee, West Drainage Canal, and modifications to the landscape and irrigation/drainage system would be similar under the Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative.

As noted above, the Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative would use differing methods to achieve flood damage reduction objectives for the Sacramento River east levee Reach A:16–20. Therefore, the differences between the Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative, including effects on habitats, are the result of these differences in design of the Sacramento River east levee.

a. Location

The 53,000-acre Natomas Basin in northern Sacramento and southern Sutter Counties, California, including a portion of the city of Sacramento (**Plate 1-1** in the EIS/EIR), is bounded by a levee system. Originally constructed in the early part of the 20th century, this levee system is bordered by the NCC to the north, the Sacramento River to the west, the American River to the south, and the PGCC and NEMDC/Steelhead Creek to the east.

b. General Description

The American River Watershed Common Features/Natomas Post-authorization Change Report (Common Features/Natomas PACR) includes all four project phases (1, 2, 3, and 4a and 4b) of the NLIP Landside Improvements Project. These project phases are summarized in Chapter 1, "Purpose and Need," of the EIS/EIR. This information will become part of the overall request for congressional review and approval of the Common Features/Natomas PACR.

USACE's overall purpose of the project is to develop and select an alternative that would reduce the risk of flood damage in the Natomas Basin. Some residual risk will always remain, however, in any flood damage reduction system. Ultimately, Congress must authorize the Common Features/Natomas PACR, which includes the Phase 4b Project. If not authorized by Congress, USACE must make decisions on whether or not to grant permission to SAFCA to alter the Natomas Basin levee system (Federal project levees) under Section 408 of the Rivers and Harbors Act (RHA), and issue permits

under Sections 404 of Clean Water Act (CWA) and 10 of RHA, for SAFCA to implement the Phase 4b Project without Federal participation.

The Natomas Basin floodplain is occupied by over 83,000 residents and $8.2 billion in damageable property. Although improvements to the Natomas Basin perimeter levee system, completed as part of the Sacramento Urban Levee Reconstruction Project and the North Area Local Project, have significantly reduced flood risk for the area, the Natomas Basin remains vulnerable to flooding in a less than 100-year (0.01 annual exceedance probability [AEP]) flood event. Uncontrolled flooding in the Natomas Basin floodplain in a flood exceeding a 100-year (0.01 AEP) event could result in $7.4 billion in damage (this excludes Sacramento International Airport [Airport] facilities) (SAFCA 2007). Flooding could also release toxic and hazardous materials, contaminate groundwater, and damage the metropolitan power and transportation grids. The disruption in transportation that could result from a major flood could affect the Airport and interstate and state highways. In addition, displacement of residents, businesses, agriculture, and recreational areas could occur. Resulting damage could hinder community growth, stability, and cohesion.

The NLIP was initially outlined in the *Natomas Levee Evaluation Study Final Report Prepared for SAFCA in Support of the Natomas Basin Components of the American River Common Features* (SAFCA 2006). This evaluation was based on the engineering studies and reports that were included as appendices to the above-referenced report, which are available for review at SAFCA's office at 1007 7th Street, 7th Floor, Sacramento, California. These studies and reports indicate that segments of the Natomas perimeter levee system reflect the following problems for both the Federal Emergency Management Agency (FEMA) 100-year (0.01 AEP) and the 200-year (0.005 AEP) design water surface elevations:

- inadequate levee height,
- through-levee seepage and foundation underseepage with excessive hydraulic gradients,
- embankment instability, and
- susceptibility to riverbank erosion and scour.

Although not highlighted in the levee evaluation report, portions of the perimeter levee system, particularly along the east levee of the Sacramento River, are also subject to vegetative and structural encroachments into the levee prism.

In January 2008, FEMA remapped the Natomas Basin as an AE zone, and the flood zone designation took effect in December 2008. FEMA defines AE zones as areas with a 0.01 AEP of flooding. The designation requires mandatory flood insurance purchases by homeowners and requires that the bottom floor of all new buildings be constructed at or above base flood elevation—as little as 3 feet above ground level in some of the Natomas Basin but up to 20 feet above ground level in much of the Basin. This designation and the associated constraints effectively stopped all projects that were not issued building permits before the new maps took effect.

Additional concerns include levee height deficiency, seepage, riverbank erosion, levee encroachments, aviation safety, habitat conservation, agricultural irrigation, and drainage infrastructure.

c. Authority and Purpose

The Common Features/Natomas PACR is being prepared by USACE to consider the level of Federal participation in flood risk management for the Natomas Basin.

USACE plans to implement the project; however, in the event the Common Features/Natomas PACR is not approved by Congress, the EIS/EIR will support SAFCA's implementation of the Phase 4b Project, should SAFCA choose to proceed without additional Federal participation.

The need for flood risk management is discussed in more detail in Chapter 1, "Introduction and Statement of Purpose and Need," of the EIS/EIR.

d. General Description and Quantity of Dredged or Fill Material

(1) General Characteristics of Material

No-Action Alternative. Without project improvements to the Natomas Basin perimeter levee system, the risk of levee failure would still remain high because to achieve the full benefits of flood damage reduction in the Natomas Basin, all phases of NLIP must be implemented. A levee failure in the Natomas Basin could result in flooding that could adversely or beneficially affect waters of the United States that occupy approximately 930 acres, or 1.7%, of the Basin (The Natomas Basin Conservancy [TNBC] 2007). Because the exact level of impact would be dependent on the flooding duration, depth, rate, timing, and location, acreages are not displayed below in **Table 1** because estimating such acreages would be too speculative for meaningful consideration.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. Construction of the levee improvements, borrow activities, and improvements and relocations of irrigation and drainage infrastructure would require the permanent placement of fill material in jurisdictional waters of the United States. A delineation of jurisdictional waters of the majority of the Phase 4b Project area was completed by AECOM and verified by USACE in 2007 through 2009 (USACE Reference IDs #20081039, #200700211, #200600795, #200900238).

Table 1 displays the potential direct and indirect impacts of the Project Alternatives to jurisdictional Waters of the United States and wetlands.

Three primary borrow sources have been identified for the project: West Lakeside School Site, the South Fisherman's Lake Borrow Area, and the Triangle Properties Borrow Area. The project could also use borrow material from sources analyzed as part of the Phase 4a Project—the Twin River Unified School District Stockpile Site, the Krumenacher Borrow Site, and the Fisherman's Lake Borrow Area. Under both the Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative, use of new project borrow sites would require the permanent fill of waters of the United States including drainage ditches, irrigation canals, and irrigated wetlands. Because design has not yet been completed, the final total acreage of fill is not known at this time. Impacts associated with haul road construction across various drainage canals would be temporary, and these resources would be restored to pre-project conditions after project completion.

A wetland delineation has not been completed for the Triangle Properties Borrow Area; however, it is expected that the rice fields in the Triangle Properties Borrow Area could contain irrigated wetlands. For the purposes of this analysis, the impacts described above are considered permanent. Vernal pools are present within the Triangle Properties Borrow Area on approximately 85 acres; areas with vernal pool complex would not be used for borrow source material and this habitat would remain undisturbed. The total acreage for temporary impacts noted in **Table 1** is the potential acreage of temporary impacts if all borrow sites are completely disturbed within their excavation footprints, which is up to 290 acres (worst-case) within the larger borrow area.

Construction of the adjacent levee along the Sacramento River east levee Reach A:16–20 under both the Adjacent Levee Alternative (Proposed Action) and the Fix-in-Place Alternative would result in potential impacts to waters of the United States, including wetlands (fill of irrigation and drainage ditches). Impacts to waters of the United States, including wetlands, would also occur from:

Table 1
Estimated Potential Direct and Indirect Impacts of the Phase 4b Project on Jurisdictional Waters of the United States

Project Feature	Functional Value[1]	Adjacent Levee Alternative (Proposed Action)		Fix-in-Place Alternative	
		Temporary Impact (acres)	Permanent Impact (acres)	Temporary Impact (acres)	Permanent Impact (acres)
Construction of Sacramento River east levee, American River north levee, NEMDC west levee[2], and PGCC west levee[2] Improvements					
Irrigation and drainage ditches (fill)[2]	Low	-	1.40	-	1.40
Wetlands (fill)[2]	Low	-	0.3	-	0.3
Construction of Erosion Repair					
Irrigation and drainage ditches (fill)[2]	Low	-	-	-	-
PGCC waterside erosion control rip rap (fill)	High	-	14.50	-	14.50
NEMDC waterside erosion control rip rap (fill)	High	-	5.49	-	5.49
Erosion repair (dewatering of PGCC)	High	14.50	-	14.50	-
Erosion repair (dewatering of NEMDC)	High	5.49	-	5.49	-
Construction of Relocated West Drainage Canal					
Irrigation and drainage ditches (fill)	Low	-	0.19	-	0.19
Irrigation ditches (dewatering of existing West Drainage Canal)[3]	Low	12.96	-	12.96	-
Construction of Relocated Riego Road Canal Vestal Drain, Morrison Canal, Chappell Ditch, and Private Irrigation					
Irrigation and drainage ditches (fill)	Low	-	0.02	-	0.02
Dewater of existing Riego Road canal	Low	-	0.68	-	0.68
Construction of Flood Protection at SR 99					
Dewater and fill of NCC	Low	0.69	0.69	0.69	0.69
Fill of seasonal wetland	Low	-	0.43	-	0.43
Fill of irrigated wetland[4]	Low		<27		<27
Replacement of RD 1000's Pumping Plant Nos. 6 and 8 and City Sump Pumps 102 and 160					
Intake channel modification (dewater)	High	-	0.50	-	0.50
Sacramento River waterside outfall construction (fill)[5]	High	-	0.03	-	0.03
NEMDC waterside outfall construction (fill)	High	-	0.76	-	0.76
Borrow Site and Haul Road Construction					
South Fisherman's Lake drainage ditches and canals (fill/dewater)	Low	-	1.38	-	1.38
West Lakeside School Site Borrow Area	Low	0.26	-	0.26	-
Irrigated wetlands in Triangle Properties Borrow Area (fill)[6]	Low	<290	<147	<290	<147
Total (approximate)		**324**	**199**	**324**	**199**

Notes: NCC = Natomas Cross Canal; NEMDC = Natomas East Main Drainage Canal; PGCC = Pleasant Grove Creek Canal; RD = Reclamation District; SR = State Route

[1] Functional value definitions: High = Natural structure and function of biotic community maintained, with minimal changes evident. Moderate = Moderate changes in structure and function of biotic community—i.e., moderate level of disturbance. Low = Severe changes in structure and/or function of biotic community evident—i.e., high level of disturbance. See Section 3.3.7 in Chapter 3, "Affected Environment," of the EIS/EIR for additional information.

[2] A portion of the project area along the PGCC west levee overlaps within the footprint previously analyzed in the Phase 3 EIS and EIR. Only impacts unique to the Phase 4b Project are reported in this table.

[3] The entire West Drainage Canal would be dewatered for improvements; however, only a 3.99-acre/4,700-foot-long section would be relocated.

[4] Chappell Ditch and Drain improvements would occur in areas that are currently in rice production; irrigated wetlands are generally a small component of actively farmed rice fields.

[5] Section 404 of the Clean Water Act and Section 10 of the Rivers and Harbors Act authorizations are required for work on the waterside of the levee.

[6] Approximately 290 acres of rice is present on the Triangle Properties Borrow Area; irrigated wetlands are generally a small component of actively farmed rice fields. Permanent impact assumes the worst-case scenario that 147 acres of shallow detention basins could not be returned to rice production.

Source: Data provided by Wood Rodgers in 2009 and Mead & Hunt in 2009; data compiled by AECOM in 2010

- raising and widening the west levee of NEMDC North;
- bank protection in the PGCC and NEMDC (including relocation of the low-flow channel in NEMDC South);
- relocating irrigation ditches along the NCC south levee and the west levees of PGCC and NEMDC North; and
- removing culverts under the PGCC.

Fill associated with levee modifications would occur in irrigated wetlands along the PGCC and NEMDC. Fill of seasonal wetlands and vernal pools would occur along NEMDC North as a result of levee raising and widening. Relocation and extension of the West Drainage Canal, Riego Road Canal, Vestal Drain, and Morrison Canal would result in permanent fill of drainage and irrigation ditches, and irrigated wetlands in rice fields.

Under the Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative, the discharge pipes associated with RD 1000's Pumping Plant Nos. 1A and 1B along the Sacramento River east levee, Pumping Plant No. 6 along the NEMDC North, Pumping Plant No. 8 along the NEMDC South, City Sump 160 along the Sacramento River east levee, City Sump 102 along the NEMDC South, and City Sump 58 along the American River north levee would be replaced. Additionally, dewatering and new outfall construction would be required for all pumping plants except RD 1000 Pumping Plant Nos. 1A and 1B. Most of the outfalls would be placed above the OHWM and would not be expected to qualify as fill of waters of the United States under Section 404 of the CWA. Outfall installation, however, would result in temporary impacts due to dewatering within waters of the United States. The installation of these outfalls would result in the removal of some minor amounts of riparian vegetation.

Replacement of the discharge pipes would consist of raising the pumping plants' discharge pipes, extending the pipes to tie into existing discharge pipes within the waterside bench, and replacing or modifying pumps and motors. Seepage remediation in these locations may be required, including relocating the landside stations away from the levee to accommodate the raised discharge pipes. Modifications to the landside intake channel of RD 1000 Pumping Plant Nos. 6 and 8 may also be required. The waterside levee slope of RD 1000 Pumping Plant No. 8 would require partial regrading to accommodate the raised pump discharge pipes.

Lower Dry Creek, located east of the NEMDC, has been identified as a planting area to compensate for the Phase 4b Project's removal of landside and potentially waterside trees. Seasonal wetlands, vernal pools, freshwater marsh, and intermittent drainages are present within the planting area. Woodland mitigation plantings would not result in fill to waters of the United States; however, temporary impacts may occur from hauling woodland plantings and associated materials to planting sites.

(2) Source of Material

For levee improvements along the Sacramento River east levee Reach A:16–20 and the American River north levee Reach I:1–4, the proposed South Fisherman's Lake Borrow Area (**Plate 2-7a** in the EIS/EIR) and the West Lakeside School Site (**Plate 2-17** in the EIS/EIR) are anticipated to be the primary source of soil borrow material. A portion of the Fisherman's Lake Borrow Area (identified on **Plate 2-6** in the EIS/EIR), which was fully analyzed in the Phase 4a EIS/EIR, could provide additional borrow material for these improvements. The proposed Triangle Properties Borrow Area (**Plate 2-13** in the EIS/EIR) would be the primary source of borrow material for levee improvements along the PGCC (Reach E) and NEMDC North (Reaches F–G). The Krumenacher borrow site and Twin Rivers Unified School District stockpile site (**Plate 2-14** in the EIS/EIR), which were fully analyzed in previous environmental documents, would be the source of borrow material for improvements to NEMDC South

and back-up sources for NEMDC North (Reaches F–G). The South Fisherman's Lake Borrow Area, the West Lakeside School Site, and the Triangle Properties Borrow Area are fully analyzed in the EIS/EIR.

e. Description of the Proposed Discharge Site(s)

No-Action Alternative. There is no construction proposed as part of the No-Action Alternative, therefore there would be no discharge of fill materials.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. The locations of the discharge sites are in various locations around the perimeter and adjacent lands within the Natomas Basin where levee improvements are proposed. Primarily, the project activities would occur near the Sacramento River east levee, NCC south levee, NEMDC west levee, the American River north levee, and the PGCC west levee in the Natomas Basin. These are described in more detail in Chapter 2, "Alternatives," Chapter 3, "Affected Environment," and Chapter 4, "Environmental Consequences and Mitigation Measures," of the EIS/EIR.

(2) Size (acres)

No-Action Alternative. There is no construction proposed as part of the No-Action Alternative, therefore there would be no discharge of fill materials.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. Acres of impact are described above in Section D 1. Acres of impacts due to discharge of fill material for the Adjacent Levee Alternative (Proposed Action) and the Fix-in-Place Alternative would be similar.

(3) Type of Site (confined, unconfined, open water)

The fill areas for the project would take place in confined, unconfined areas, and open water.

(4) Type(s) of Habitat

No-Action Alternative, Adjacent Levee Alternative (Proposed Action), and Fix-in-Place Alternative. Based on the methodology for previously verified wetland delineations, irrigation/drainage canals and ditches in the Phase 4b Project area are anticipated to be considered waters of the United States and subject to regulation under CWA Section 404, though not all of the Phase 4b Project area has been verified by USACE. Other permanently and/or seasonally wet habitats, such as freshwater marsh, seasonal wetland, and vernal pool, could qualify as jurisdictional waters of the United States subject to Section 404 regulation if they are adjacent or abutting other jurisdictional waters of the United States. In the Phase 4b Project area, vernal pools are known to occur along the NEMDC, the Triangle Properties Borrow Area, and along Lower Dry Creek.

Previous delineation reports verified by USACE that cover portions of the Phase 4b Project footprint include a wetland delineation completed in 2008 that covers the PGCC and the NEMDC South (USACE Reference ID #20081039), a 2007 delineation that covers areas on the landside of the Sacramento River east levee Reaches 1–20 (C:1–4B, B:5A–15, and A:16–20) (USACE Reference ID #200700211), a delineation completed in 2006 for the NCC within the NLIP footprint (USACE Reference ID #200600795), and a delineation for the proposed woodland planting area at Lower Dry Creek east of the NEMDC (USACE Reference ID #200900238). These delineations identified the following features that fall within the Phase 4b Project area as jurisdictional: irrigation/drainage ditches and canals along the landside toe of the levee, irrigated wetlands in rice fields, freshwater marsh habitat, seasonal wetlands, and vernal pools. A delineation of jurisdictional waters of the United States covering the South Fisherman's Lake Borrow Area, the landside of the American River north levee, and the NEMDC North was submitted to USACE in September 2009 for review and verification and a preliminary jurisdictional determination is expected by summer 2010; a separate delineation for the West Lakeside

School Site has also been submitted to USACE and is currently under review. A delineation has not yet been completed for the West Drainage Canal east of Powerline Road, nor for the Triangle Properties Borrow Area (these will be completed by USACE). Jurisdictional features within these areas are expected to include primarily irrigation/ drainage ditches and irrigated wetlands in rice fields; seasonal wetlands and vernal pools are known to occur in the Triangle Properties Borrow Area.

In addition, the installation of an outfall at City of Sacramento Sump Pump No. 160 in Reach A:19B along the Sacramento River east levee would be within USACE jurisdictional areas. Discharge pipes and outfalls conveying filtered stormwater drainage from the east levee to the east bank of the Sacramento River under the Adjacent Levee Alternative (Proposed Action) might extend to areas within the jurisdiction of CWA Section 404 and/or RHA Section 10.

The functional quality of an aquatic resource is considered by USACE as part of the CWA Section 404 regulatory process. Habitat quality may be generally categorized as low, moderate, or high, defined herein as follows:

- **Low**: High levels of disturbance (e.g., vegetation disking for fire clearance purposes, dominance of monotypic stands of nonnative vegetation, presence of human-made structures).
- **Moderate**: Moderate levels of disturbance (e.g., natural plant communities intact with some evidence of nonnative vegetation, low-intensity developments such as trails, selective vegetation management for flood damage reduction purposes).
- **High**: Natural structure and function of biotic community exists, with minimal changes in structure or function evident—i.e., zero to low levels of human disturbance (e.g., natural plant communities intact, no artificial structures present, sensitive plant and/or wildlife species utilization).

(5) Timing and Duration of Discharge

No-Action Alternative. As described above, there would be no construction proposed and therefore no discharge of fill materials under the No-Action Alternative.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. The timing of the discharge for both the Adjacent Levee Alternative (Proposed Action) and the Fix-in-Place Alternative would be similar. Discharge of fill material (borrow materials or new structures) would occur during grading, placement of fill prior to and during levee construction, construction of replacement and/or new irrigation and drainage infrastructure (e.g., canals, ditches, pump plants), throughout the calendar year, but mainly during the work period between May 1 and September 30 of each year.

f. Description of Disposal Method (hydraulic, drag line)

All of the fill work would be done with dozers, dump trucks, motor graders, and rollers.

II. Factual Determinations (Section 230.11)

a. Physical Substrate Determinations (consider items in Section 230.11(a# and 230.20 Substrate)

(1) Substrate Elevation and Slope

No-Action Alternative, Adjacent Levee Alternative (Proposed Action), and Fix-in-Place Alternative. The substrate elevation is roughly at sea level and the Natomas Basin is generally flat in slope. The topography of the Natomas Basin is flat, with dominant landscape features formed by the perimeter levees. The Phase 4b Project occurs in primarily agricultural and urban areas with little or no natural slopes. The substrate elevation and slope is the same for all alternatives. None of the proposed

modifications associated with the project would change the substrate characteristics of the landscape, because non-native substrates from outside the basin would not be introduced, nor would construction alter the underlying drainage or soil characteristics under the proposed features except to improve protection from levee under- and through-seepage.

(2) Sediment Type

No-Action Alternative, Adjacent Levee Alternative (Proposed Action), and Fix-in-Place Alternative. The soils in the project area are sediments adjacent to the Sacramento and American Rivers. These sediments are composed of Recent (Holocene) alluvial floodplain deposits (see Section 3.9.2.1 of the EIS/EIR). In general, these deposits consist primarily of unconsolidated sand and silt. Holocene alluvial deposits overlay an older alluvial fan system composed of Pleistocene-age sediments. Construction activities that would occur within alluvial floodplain or basin deposits would be located within Holocene sediments.

Riverbank and Modesto Formations. Piper et al. (1939) were the first to publish detailed geologic maps in the southern Sacramento and northern San Joaquin Valley areas, and they designated the older alluvial Pleistocene deposits as the Victor Formation. However, Davis and Hall (1959) proposed a subdivision of the Victor Formation into the Turlock Lake (oldest), Riverbank (middle), and Modesto (youngest) Formations. Marchand and Allwardt (1981) proposed that the Victor Formation be replaced by the Turlock Lake, Riverbank, and Modesto Formations as formal nomenclature for Quaternary deposits in the Sacramento and San Joaquin Valleys. Most researchers have followed this recommendation.

In the Sacramento Valley, the Modesto Formation consists of alluvial terraces, some alluvial fans, and some abandoned channel ridges of the Sacramento River. The Modesto Formation can be divided into upper and lower members. The upper member consists primarily of unconsolidated, unweathered, coarse sand and sandy silt. The age of this member has been placed at approximately 12,000–26,000 years Before Present (B.P.) (Atwater cited in Helley and Harwood 1985). The lower member of the Modesto Formation consists of consolidated, slightly weathered, well-sorted silt and fine sand, silty sand, and sandy silt. Age estimates for the lower member range from 29,000 to 42,000 years B.P. (Marchand and Allwardt 1981, cited in Helley and Harwood 1985).

Sediments in the Riverbank Formation consist of weathered reddish gravel, sand, and silt that form alluvial terraces and fans. In the Sacramento Valley, this formation tends toward soil-profile developments that are more easily distinguishable from the Modesto Formation (Helley and Harwood 1985). The Riverbank Formation is Pleistocene in age (Wagner et al. 1987), but it is considerably older than the Modesto Formation; estimates place the age of the Riverbank between 130,000 and 450,000 years B.P. (Helley and Harwood 1985). The Riverbank Formation forms alluvial fans and terraces of the Sacramento River. The Riverbank's fans and terraces are higher in elevation and generally have a more striking topography than those formed by the Modesto Formation.

(3) Dredged/Fill Material Movement

No-Action Alternative. Under the No-Action Alternative, no construction activities would occur; therefore, no potential exists for this alternative to affect dredged/fill material movement. There would be no impact under this alternative.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. The fill material needed for the levee construction, replacement of new irrigation and drainage infrastructure, and other construction, would be moved from the borrow sites and placed in the construction areas. Once there, the material would typically be graded and compacted according to the feature that is being constructed, and is not expected to move after construction is completed.

(4) Physical Effects on Benthos (burial, changes in sediment type, etc.)

No-Action Alternative. Under the No-Action Alternative, no construction activities would occur; therefore, no potential exists for this alternative to physically affect benthos. There would be no impact under this alternative.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. The fill material needed for the levee construction, replacement of new irrigation and drainage infrastructure, and other construction, would be moved from the borrow sites and placed in the construction areas, often permanently affecting irrigation and drainage canals and ditches, and in some cases small seasonal wetlands. Adverse affects on benthos due to discharge of fill materials would be temporary in nature, until the filled features can be replaced or restored. Therefore, there would be no adverse effect on benthos.

(5) Other Effects

No-Action Alternative. No other effects would occur as a result of the No-Action Alternative.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. The effects to the physical substrate of the drainages and fill areas would be permanent. Habitat quality would improve in most of the borrow areas because of the conversion from low to moderate quality natural habitats to higher quality managed habitat.

(6) Actions Taken to Minimize Impacts (Subpart H)

No-Action Alternative. Under the No-Action Alternative, no actions are proposed to minimize impacts.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. A number of measures would be taken to minimize impacts to the various environmental resources (e.g., agricultural land, sensitive aquatic habitats including USACE jurisdictional features, wildlife habitat, and cultural resources) that would be affected by the Phase 4b Project. These are described in detail in Chapter 4, “Environmental Consequences and Mitigation Measures,” of the EIS/EIR.

b. Water Circulation, Fluctuation, and Salinity Determinations

(1) Water (refer to section 230.11(b), 230.22 Water, and 230.25 Salinity Gradients; test specified in subpart G may be required). Consider effects on:

(a) Salinity.

No-Action Alternative. No fill would occur as part of the No-Action Alternative and therefore there would be no impact on salinity.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. The fill areas are not in or near saline water. The fill areas get water from rain events and do not connect with any saline waters. This water is fresh water and therefore, filling these areas would not adversely affect salinity.

(b) Water Chemistry (pH, etc.)

No-Action Alternative. No fill would occur as part of the No-Action Alternative and therefore there would be no impact on water chemistry.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. Planned construction activities for both alternatives would coincide with part of the rainy season. These activities

have the potential to temporarily impair water chemistry if disturbed and eroded soil, petroleum products, or construction-related wastes (e.g., cement and solvents) are discharged into receiving waters or onto the ground where they can be carried into receiving waters. Soil and associated contaminants that enter receiving waters through stormwater runoff and erosion can increase turbidity, stimulate algae growth, increase sedimentation of aquatic habitat, and introduce compounds that are toxic to aquatic organisms. Accidental spills of construction-related substances such as oils and fuels can contaminate both surface water and groundwater. The extent of potential impacts on water quality would depend on the following factors: tendency for erosion of soil types encountered, types of construction practices, extent of the disturbed area, duration of construction activities, timing of particular construction activities relative to the rainy season, proximity to receiving water bodies, and sensitivity of those water bodies to construction-related contaminants.

Slurry that would be used for construction of new cutoff walls in the Sacramento River east levee, American River north levee, and the west levee of NEMDC North has a fluid consistency when being placed. Improper handling or storage could result in releases to nearby surface water, thereby degrading water quality.

Replacement of discharge pipes at the RD 1000 pumping plants and City of Sacramento sump pumps listed above would involve excavation and grading on the waterside of the Sacramento River east levee, American River north levee, and NEMDC west levee. These activities could result in discharge of sediment and construction-related substances such as oils and fuels into these waterways.

Excavated areas that fill with surface or groundwater during project construction (such as areas along the NEMDC west levee, the American River north levee, and the Sacramento River east levee) would require dewatering. Surface or groundwater extracted from dewatering operations typically contains high levels of suspended sediment and often high levels of petroleum products and other construction-related contaminants. This extracted water could be directly released to local receiving waters, thereby degrading water quality.

The potential for release of soil or construction-related materials into the NEMDC, the PGCC, the NCC, the West Drainage Canal, local drainages, and ultimately the American or Sacramento Rivers could adversely affect river water quality.

(c) Clarity

No-Action Alternative. There would be no construction and no discharge of fill material as part of the No-Action Alternative and therefore there would be no adverse effect on water clarity.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. In areas of permanent fill where no jurisdictional waters remain after the fill, there would be a permanent loss of clarity. These areas are described above in **Table 1**. However, for areas that are not permanently filled, there would be only a temporary effect on clarity, as turbidity would be temporarily affected during construction. With the implementation of the mitigation measures in Section 4.7, “Water Quality,” of the EIS/EIR and compliance with all applicable local, state, and Federal regulations, this would not be considered an adverse effect.

(d) Color

No-Action Alternative. There would be no construction and no discharge of fill material as part of the No-Action Alternative; therefore, there would be no effect on color.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. In areas of permanent fill where no jurisdictional waters remain after the discharge of fill material, there would be a permanent loss of color. These areas are described above in **Table 1**. However, for areas that are not

permanently filled, there would be only a temporary effect on color, as turbidity would temporarily affect color during construction. With the implementation of the mitigation measures in Section 4.7, "Water Quality," of the EIS/EIR and compliance with all applicable local, state, and Federal regulations, this would not be considered an adverse effect.

(e) Odor

No-Action Alternative, Adjacent Levee Alternative (Proposed Action), and Fix-in-Place Alternative. The proposed alternatives are not expected to affect odor because fill materials are from local sources and would not introduce foreign or noxious odors into jurisdictional features. There would be no effect.

(f) Taste

No-Action Alternative, Adjacent Levee Alternative (Proposed Action), and Fix-in-Place Alternative. The proposed alternatives are not expected to affect taste because fill materials are from local sources and would not introduce foreign or noxious odors into jurisdictional features. There would be no effect.

(g) Dissolved Gas Level

No-Action Alternative. There would be no construction and no discharge of fill material would occur due to the No-Action Alternative; therefore, no effects to dissolved gas levels would occur as a result of the No-Action Alternative.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. The Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative would both cause temporary effects to dissolved gas levels during temporary dewatering of some irrigation and drainage ditches and canals, and during the construction of the replacement ditches and canals. The effects are not expected to be significant and they would be temporary in nature. A noticeable change with regard to dissolved gas levels would not occur, and in most cases conditions would be improved due to the improved nature of the replacement canals.

(h) Nutrients

No-Action Alternative. There would be no construction and no discharge of fill material would occur due to the No-Action Alternative; therefore, no effects to nutrients would occur as a result of the No-Action Alternative.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. In areas of permanent fill where no jurisdictional waters remain after the discharge of fill material, there would be a permanent loss of nutrients. These areas are described above in **Table 1**. However, for areas that are not permanently filled, there would be only a temporary effect on nutrients, as dewatering would temporarily affect nutrients suspension and inflow of drainage and irrigation water during construction. With the implementation of the mitigation measures in Section 4.7, "Water Quality," of the EIS/EIR and compliance with all applicable local, state, and Federal regulations, this would not be considered an adverse effect.

(i) Eutrophication

No-Action Alternative. There would be no construction and no discharge of fill material would occur due to the No-Action Alternative; therefore, no effects to eutrophication would occur as a result of the No-Action Alternative.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. Eutrophication would not occur in the ditches and canals affected by the project because replacement canals and ditches would be constructed concurrently or ahead of discharge of fill m and conditions (i.e., anaerobic standing water) that would lead to eutrophication would not occur. None of the proposed alternatives' components would permanently adversely affect eutrophication.

(j) Others as Appropriate

No-Action Alternative, Adjacent Levee Alternative (Proposed Action), and Fix-in-Place Alternative. As described in Sections 4.5, "Hydrology and Hydraulics," and 4.6, "Water Quality," with the implementation of mitigation measures described, the project is not expected to adversely affect other water characteristics.

(2) Current Patterns and Circulation (consider items in Section 230.11[b], and 230.23),

Current Flow and Water Circulation

(a) Current Patterns and Flow

No-Action Alternative. There would be no construction and no discharge of fill material would occur due to the No-Action Alternative; therefore, no effects to current patterns and flow would occur as a result of the No-Action Alternative.

Adjacent Levee Alternative (Proposed Action). Interior drainage patterns would be altered due to the levee construction (east approach). Minor drainages would be installed on the waterside of the Sacramento River east levee to route storm drainage between the existing Garden Highway and the adjacent levee. In addition, existing irrigation and drainage canals and ditches would be replaced where filled. After construction, the irrigation and drainage functions would be restored. There would be no substantial drainages eliminated and no substantial changes in the amount of flow. These changes would not be considered adverse effects.

Fix-in-Place Alternative. Effects on drainage patterns due to the Fix-in-Place Alternative would be similar to those caused by the Adjacent Levee Alternative (Proposed Action) except that there would not be a substantial alteration to the drainage of the existing Sacramento River east levee. Other changes to drainage patterns within the Natomas Basin in the project area would be similar and would not be considered an adverse effect.

(b) Velocity

No-Action Alternative. There would be no levee construction associated with the No-Action Alternative and, thus, velocities would not be affected.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. Improvements and replacements of irrigation and drainage canals and ditches as part of the Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative would cause some temporary effects to drainage velocities in the interior of the Basin, but these would be restored once construction is complete. This effect would not be considered adverse. There would be no effect to velocities in the waterways adjacent to the Natomas Basin and, thus, no adverse effect.

(c) Stratification

No-Action Alternative. There would be no construction and no discharge of fill material would occur due to the No-Action Alternative; therefore, no effects to stratification would occur as a result of the No-Action Alternative.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. The alternatives are not expected to significantly affect stratification in the interior of the Natomas Basin or adjacent waterways because discharge of fill materials is expected to occur in the Natomas Basin when aquatic areas are dewatered. Therefore, no effect on stratification would occur during construction. Fill materials are not likely to cause additional erosion or sedimentation in the water column; therefore, stratification after construction is not likely to occur. There would be no adverse effect.

(d) Hydrologic Regime

No-Action Alternative. There would be no construction and no discharge of fill material would occur due to the No-Action Alternative; therefore, no effects to the existing hydrologic regime would occur as a result of the No-Action Alternative.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. As described above, some irrigation and drainage canals and ditches would need to be replaced under the Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative, but would be restored as part of the project. Therefore, the Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative are not expected to significantly affect the hydrologic regime in the interior of the Natomas Basin or adjacent waterways.

(3) Normal Water level Fluctuations (tides, river stage) (consider items in Sections230.11[b] and 230.24)

No-Action Alternative. There would be no construction and no discharge of fill material would occur due to the No-Action Alternative; therefore, no effects to normal water level fluctuations would occur as a result of the No-Action Alternative.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. The Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative are not expected to affect normal water level fluctuations in the waterways adjacent to the Natomas Basin. As presented above in **Table 1**, fill material would be placed within the channel slopes of adjacent waterways for discharge of storm water, intake of irrigation water, and erosion control, but these features do not significantly the flow of the waterways and are not expected to adversely affect normal water level fluctuations.

(4) Salinity Gradients (consider items in section 230.11[b] and 230.25)

No-Action Alternative. There would be no construction and no discharge of fill material would occur due to the No-Action Alternative; therefore, no effects to salinity gradients would occur as a result of the No-Action Alternative.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. The Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative would involve replacement of and improvements to the existing irrigation and drainage infrastructure in the Natomas Basin, all of which convey freshwater. These alternatives are not expected to adversely affect salinity gradients in the interior of the Natomas Basin or adjacent waterways.

(5) Actions That Will Be Taken to Minimize Impacts (refer to Subpart H)

No-Action Alternative. The No-Action Alternative does not include any actions to minimize impacts.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. Potential adverse effects to water circulation, fluctuation, and salinity would not result due to the Adjacent Levee Alternative (Proposed Action) and the Fix-in-Place Alternative and, thus, no specific actions will be taken to minimize impacts.

e. Suspended Particulate/ Turbidity Determinations

(1) Expected Changes in Suspended Particulates and Turbidity Levels in Vicinity of Disposal Site (consider items in section 230.11[c] and 230.21)

No-Action Alternative. There would be no construction and no discharge of fill material would occur due to the No-Action Alternative; therefore, no effects to suspended particulates and turbidity would occur as a result of the No-Action Alternative.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. Existing conditions include irrigation and drainage canals and ditches, which have steep side slopes with inconsistent vegetative cover. As part of the alternatives, this infrastructure would be replaced with facilities that would be improved to have wider slopes and more consistent vegetative cover (i.e., native-grass-seeded slopes), resulting in less erosion and lower maintenance requirements. Maintenance activities often cause temporary and short-term impacts including increased suspended particulates and turbidity within those canals and ditches.

There would be no changes in suspended particulates and turbidity in the fill areas that are not in areas of permanent water. The drainages that would be disturbed during construction would likely experience temporary increases in suspended particulate and turbidity. Once the roadway and new access road are completed and the new culverts installed, there would likely be an increase in suspended particulates and turbidity during the first few rain events. However, there would not significant long-term changes in suspended particulates and turbidity.

(2) Effects (degree and duration) on Chemical and Physical Properties of the water Column (consider environmental values in Section 230.21, as appropriate)

(a) Light Penetration

No-Action Alternative. There would be no construction and no discharge of fill material would occur due to the No-Action Alternative; therefore, no effects to light penetration would occur as a result of the No-Action Alternative.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. There would be no permanent effects to light penetration due to the Adjacent Levee Alternative (Proposed Action) and the Fix-in-Place Alternative. The project would not change the remaining jurisdictional waters in a way that would increase or decrease light penetration. The existing drainages that would not be directly affected (i.e., filled) or replaced would be restored to existing conditions after construction is completed.

(b) Dissolved Oxygen

No-Action Alternative. There would be no construction and no discharge of fill material would occur due to the No-Action Alternative; therefore, no effects to dissolved oxygen would occur as a result of the No-Action Alternative.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. Temporary effects to dissolved oxygen in jurisdictional features in the Phase 4b Project vicinity may occur during construction of the Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative due to situations where aquatic features such as canals and ditches would be partially dewatered to facilitate levee construction, canal or ditch improvement, or replacement. Once construction is complete, these canals and ditches would be improved, restored, or replaced. There would be no adverse effects to dissolved oxygen due to the Adjacent Levee Alternative (Proposed Action) or Fix-in-Place Alternative.

(c) Toxic Metals and Organics

No-Action Alternative. There would be no construction and no discharge of fill material would occur due to the No-Action Alternative; therefore, no effects to toxic metals and organics would occur as a result of the No-Action Alternative.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. There would be no contaminants introduced to the drainage areas or any other jurisdictional waters with the project area. Due to the inertness of the fill materials, there would be no exchange of constituents between the fill and aquatic systems.

(d) Pathogens

No-Action Alternative. There would be no construction and no discharge of fill material would occur due to the No-Action Alternative; therefore, no effects to pathogens would occur as a result of the No-Action Alternative.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. As described in the EIS/EIR, the proposed project would incorporate water quality features that would reduce the potential for pathogens to be introduced as a result of an increase in impervious surfaces (i.e., less heavy machinery traffic due to maintenance equipment traffic) and stormwater runoff. The Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative would comply with all applicable local, state, and Federal laws regarding water quality. Therefore, there would be no adverse effects due to these alternatives.

(e) Aesthetics

No-Action Alternative. Under the No-Action Alternative (No Project Construction), as described in Section 4.14, "Visual Resources," of the EIS/EIR, to comply with USACE guidance regarding levee encroachments, trees and vegetation would be removed from the landside and waterside of Sacramento River east levee Reach A:16–20, the landside of American River north levee Reach I:1–4, a portion of NEMDC South to the Arden-Garden Connector, and the landside and waterside of NEMDC South between Arden-Garden Connector and the NEMDC Stormwater Pumping Station. Up to 6 acres of waterside vegetation could also be removed from the American River north levee in the event that a variance from USACE levee vegetation guidance is not granted, resulting in a total of (estimated) approximately 25.89 acres of waterside vegetation that would be removed under this alternative. The quality of the views of the waterside of the levees would be degraded for recreational users of the rivers, residents along the waterside of the Sacramento River east levee, Garden Highway users, and others in the Natomas Basin that may be near a site where any large trees are removed. That is because the crowns of many trees, such as large cottonwood and oak trees, and Heritage oaks on the waterside or landside of the levees, are clearly visible from most parts of the Natomas Basin. Under this alternative, no minimization measures are proposed to mitigate for these effects.

Adjacent Levee Alternative (Proposed Action). As described in Section 4.14, "Visual Resources," of the EIS/EIR, effects to visual resources include those which would occur during construction (construction equipment and general disturbance) and include the movement of heavy machinery near residences and other recreational viewers in the Sacramento River. The effects from these activities would be temporary and short-term and would not be considered adverse. In addition, as described in **Table 4.7-2** in Section 4.7, "Biological Resources," the removal of (estimated) approximately 7.32 acres mature waterside vegetation combined with affects due to high viewer sensitivity of recreational users of the Sacramento River and residents on the waterside of the levee would be considered an adverse effect. Project effects would be offset by implementation of mitigation measures in the EIS/EIR, specifically Mitigation Measure 4.14-a, "Implement Mitigation Measures 4.7-a, "Minimize Effects on Woodland Habitat; Implement all Woodland Habitat Improvements and

Management Agreements; Compensate for Loss of Habitat; and Comply with Section 7 of the Federal Endangered Species Act, Section 1602 of the California Fish and Game Code, and Section 2081 of the California Endangered Species Act Permit Conditions," and 4.13-b, "Compensate City of Sacramento Department of Parks and Recreation for Loss of Parkland and Park Amenities."

Fix-in-Place Alternative. As described in Section 4.14, "Visual Resources," of the EIS/EIR, temporary and short-term effects to visual resources as a result of the movement of heavy machinery near residences would be similar to the Adjacent Levee Alternative (Proposed Action). However, as described in **Table 4.7-2** in Section 4.7, "Biological Resources," the Fix-in-Place Alternative would result in the removal of (estimated) approximately 26.52 acres of waterside vegetation, which is a greater effect than the Adjacent Levee Alternative (Proposed Action). Similarly, the removal of waterside vegetation combined with the same high viewer sensitivity of recreational users of the Sacramento River and residents on the waterside of the levee would be considered an adverse effect. Similar to the Adjacent Levee Alternative (Proposed Action), effects would be offset by implementation of mitigation measures in the EIS/EIR, specifically Mitigation Measure 4.14-a, discussed above.

(f) Others as Appropriate

No-Action Alternative, Adjacent Levee Alternative (Proposed Action), and Fix-in-Place Alternative. There would be no construction and no discharge of fill material would occur due to the No-Action Alternative; therefore, no effects to chemical and physical properties of the water column would occur as a result of the No-Action Alternative. There would be no other adverse effects due to the project alternatives.

(3) Effects on Biota (consider environmental values in Section 230.21, as appropriate)

(a) Primary Production, Photosynthesis

No-Action Alternative. As described in Section 2(e) above, an (estimated) approximately 25.89 acres of riparian woodland/shaded riverine aquatic (SRA) habitat would be removed as part of the No-Action Alternative, which would affect primary production (i.e., photosynthesis). This would be considered an adverse effect.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. As described in Section 2(e) above, an (estimated) approximately 7.32 acres and 25.52 acres of riparian woodland/SRA habitat would be removed as part of the Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative, respectively, which would affect primary production (i.e., photosynthesis).

(b) Suspension/Filter Feeders

No-Action Alternative. Suspension and/or filter feeders have been known to occur in the Sacramento River and the American River; however, the No-Action Alternative would not involve any construction that would adversely affect populations of suspension and/or filter feeders.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. The majority of the construction work and fill materials in the Sacramento and American Rivers would be limited to the area of the Sacramento River east levee waterside slope above the ordinary high water mark, and would not adversely affect populations of suspension and/or filter feeders. Primarily, effects to the irrigation and drainage canals and ditches in the interior of the Natomas Basin would occur due to the Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. Significant populations of filter feeders are not known in the interior of the Natomas Basin; therefore, no adverse effect would occur.

(c) Sight Feeders

No-Action Alternative. Sight feeders have been known to occur in the Sacramento and the American Rivers, however the No-Action Alternative does not have any construction that would directly adversely affect populations of sight feeders. However, as described in Section 4.7, "Biological Resources," of the EIS/EIR, waterside woodlands on the Sacramento River provide SRA habitat function, which is important for sight feeders such as fish and other Sacramento River aquatic resources. Removal of an (estimated) approximately 25.89 acres of waterside riparian woodland habitat would adversely affect important SRA habitat, including moderation of water temperatures, recruitment of woody debris, and introduction of insects that provide food for aquatic species.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. Sight feeders such as listed fish species occur in the Sacramento and the American Rivers; however, the Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative do not have any construction that would directly adversely affect listed fish populations. The majority of the construction work and fill materials in the Sacramento and American Rivers would be limited to the area of the Sacramento River east levee waterside slope above the ordinary high water mark, and would not adversely affect fish populations because in water work is minimal. Primarily, effects to the irrigation and drainage canals and ditches in the interior of the Natomas would occur due to the Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. Listed fish populations are not known to occur in the interior of the Natomas Basin and so no adverse effect would occur.

As described in detail in Section 4.7, "Biological Resources," of the EIS/EIR, removal of an (estimated) approximately 7.32 acres and 25.52 acres for the Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative, respectively, of waterside riparian woodland habitat would adversely affect important SRA habitat, including moderation of water temperatures, recruitment of woody debris, and introduction of insects that provide food for aquatic species. This would be considered an adverse effect to SRA habitat.

(4) Actions Taken to Minimize Impacts (Subpart H)

No-Action Alternative. No construction is proposed as part of the No-Action Alternative; therefore, no actions would be taken to minimize impacts under the No-Action Alternative.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. Section 4.7, "Biological Resources," of the EIS/EIR contains Mitigation Measure 4.7-a, "Minimize Effects on Woodland Habitat; Implement Woodland Habitat Improvements and Management Agreements; Compensate for Loss of Habitat; and Comply with Section 7 of the Federal Endangered Species Act, Section 2081 of the California Endangered Species Act, and Section 1602 of the California Fish and Game Code," which requires the project proponent to consult with and seek approval from the resource agencies, determine the appropriate amount of habitat to be created, and create and maintain sufficient habitat as compensation for impacts due to the alternatives.

d. Contaminant Determinations (consider items in Section 230.11[d])

No-Action Alternative. There would be no construction and no discharge of fill material would occur due to the No-Action Alternative; therefore, no effects due to contaminants would occur as a result of the No-Action Alternative. There would be no other adverse effects.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. As described in detail in Section 4.6, "Water Quality," of the EIS/EIR, implementation of the Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative would include extensive ground-disturbing activities during construction, many of them near local drainages and waterways that could become contaminated by soil or construction substances. These waterways include the Sacramento River, the

American River, the NEMDC, the PGCC, the NCC, and the West Drainage Canal. The Sacramento River is a receiving water for much of the drainage from the Natomas Basin (including agricultural drainage). The potential for release of soil or construction-related contaminants/materials into the NEMDC, the PGCC, the NCC, the West Drainage Canal, local drainages, and ultimately the American or Sacramento Rivers could adversely affect water quality.

e. Aquatic Ecosystem and Organism Determinations (use evaluation and testing Procedures in Subpart G, as appropriate)

(1) Effects on Plankton

No-Action Alternative. There would be no construction and no discharge of fill material would occur due to the No-Action Alternative; therefore, no effects to plankton would occur as a result of the No-Action Alternative.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. Plankton have the potential to occur in the water bodies surrounding the Natomas Basin and within the slower moving drainages and areas of standing water (i.e., rice fields and other agricultural bodies of water). Minor temporary effects to plankton would occur due to temporary and short-term impacts to water quality, fill of aquatic habitat, and dewatering. However, mitigation and replacement for aquatic habitats and features (i.e., managed marsh creation and relocation) and improvement of drainage and irrigation features would allow populations of plankton to reestablish once constructed. Populations of plankton would not be permanently affected and thus no adverse effect would occur.

(2) Effects on Benthos

No-Action Alternative, Adjacent Levee Alternative (Proposed Action), and Fix-in-Place Alternative. Because the project alternatives are not located in the sea or lake bottom, no adverse effects on the benthic community are expected.

(3) Effects on Nekton

No-Action Alternative. There would be no impact to nekton due to the No-Action Alternative.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. As described in Chapter 3, “Affected Environment,” and Section 4.7, “Biological Resources,” nekton, specifically fish and crustaceans, occur in the project area and in the waterways surrounding the Natomas Basin. As described in Section 3 (c) above, populations of listed fish species would not be directly affected by the Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative, though significant amounts of SRA habitat would be removed from the surrounding waterways as part of the Alternatives. The removal of substantial SRA habitat from the waterways surrounding the Natomas Basin would be considered an adverse effect.

(4) Effects on aquatic Food Web (refer to Section 230.31)

No-Action Alternative. There would be no effect on the aquatic food web as part of the No-Action Alternative.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. As described in Section 4.7, “Biological Resources,” of the EIS/EIR, the proposed project would temporarily impact aquatic habitats during construction through temporary dewatering, fill and replacement of irrigation and drainage canals and ditches and rice fields. The overall replacement aquatic habitat, including canals, ditches, and managed marsh (to compensate for impacts to rice fields) would improve the aquatic habitat conditions within the Natomas Basin. There would be no adverse effect to the aquatic food web as a result of the Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative.

(5) Effects on Special Aquatic Sites (discuss only those found in project area or disposal site)

(a) Sanctuaries and Refuges (refer to section 230.40)

No-Action Alternative. There would be no levee construction as a result of the No-Action Alternative; therefore, there would be no adverse effects to sanctuaries or refuges with the proposed project.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. As described in Section 4.7, Biological Resources," of the EIS/EIR, the Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative would include habitat creation components that would expand, enhance, and improve the functionality, size and connectivity of the existing Natomas Basin Preserve lands, thus creating a beneficial impact to the existing Natomas Basin Habitat Conservation Plan.

(b) Wetlands (refer to section 230.41)

No-Action Alternative. There would be no construction and no discharge of fill material would occur due to the No-Action Alternative; therefore, no effects to wetlands would occur as a result of the No-Action Alternative.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. As described in Chapter 3, "Affected Environment," and Section 4.7, "Biological Resources," of the EIS/EIR, wetlands in the project area primarily include irrigated wetlands found in rice fields in the Natomas Basin and seasonal wetlands. As described in **Table 1**, above, the Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative would potentially result in the temporary impacts to irrigated wetlands found in the Triangle Properties borrow site. Because the borrow site would be impacted temporarily and would be restored to former productivity once construction is complete, potential adverse effects would be temporary in nature. Project effects would be permitted and if necessary, mitigated for through compliance with CWA Section 404, therefore no adverse effect would occur.

Permanent impacts to both irrigated and seasonal wetlands would occur as part of the levee, irrigation, and drainage infrastructure replacement; these totals are displayed in **Table 1**, above. As discussed in Section 4.7, "Biological Resources," the Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative would include creating waters of the United States that are expected to be more extensive than those filled by either alternative, and implementing the Phase 4b Project's restoration plan, including coordination with and issuance of the permits by the aforementioned resource/regulatory agencies, would ensure no-net-loss of sensitive aquatic habitats occurs and that new jurisdictional waters would be managed in a manner that minimizes maintenance disturbance and provides the essential functions of the habitats that would be lost. Therefore, both the Adjacent Levee Alternative (Proposed Action) and the Fix-in-Place Alternative, with implementation of this mitigation measure, would result an increase in the overall acreage and enhance the function of waters of the United States in the Natomas Basin. There would be no adverse effect to wetlands.

(c) Mud Flats (refer to Section 230.42)

No-Action Alternative, Adjacent Levee Alternative (Proposed Action), and Fix-in-Place Alternative. Mud flats do not occur in the Phase 4b Project area in the Natomas Basin. There would be no adverse project effects to mud flats.

(d) Vegetated Shallows (refer to Section 230.43)

No-Action Alternative, Adjacent Levee Alternative (Proposed Action), and Fix-in-Place Alternative. Vegetated Shallows do not occur in the Phase 4b Project area in the Natomas Basin. There would be no adverse project effects to vegetated shallows.

(e) Coral Reefs (refer to Section 230.44)

No-Action Alternative, Adjacent Levee Alternative (Proposed Action), and Fix-in-Place Alternative. Mud flats do not occur in the Project area in the Natomas Basin. There would be no adverse project effects to coral reefs.

(f) Riffle and Pool Complexes (refer to section 230.45)

No-Action Alternative, Adjacent Levee Alternative (Proposed Action), and Fix-in-Place Alternative. There are no riffle and pool complexes in the vicinity of the Phase 4b Project, therefore, there would be no adverse project effects to riffle and pool complexes.

(6) Threatened and Endangered Species (refer to Section 230.30)

No-Action Alternative. No levee or infrastructure improvements would occur and thus there would be no adverse effect to threatened and endangered species due to the No-Action Alternative.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. As described in Section 4.7, “Biological Resources,” habitat for threatened and endangered species would be adversely affected by levee construction, irrigation, and drainage improvements as part of both the Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. As part of the habitat creation plan, both alternatives would include the enhancement of habitat under management of TNBC and expand, enhance, and improve the functionality of the Preserves for threatened and endangered species in the Basin. This would be considered a temporary adverse effect while the replacement habitats are being constructed, but a long-term beneficial effect once functions and values have been restored.

Direct impacts (i.e., “take” as defined by the Endangered Species Act and the California Endangered Species Act) would be minimized to the extent feasible by implementing the mitigation measures in the EIS/EIR and the conservation and minimization measures developed during consultation with the U.S. Fish and Wildlife Service (USFWS), the California Department of Fish and Game (DFG) and the National Marine Fisheries Service (NMFS). With the implementation of the mitigation, conservation, and minimization measures, no adverse effect would occur.

(7) Other Wildlife (refer to Section 230.32)

No-Action Alternative. No levee or infrastructure improvements would occur and, thus, there would be no adverse effect to other wildlife species due to the No-Action Alternative.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. Similar to the effects described above for threatened and endangered species, effects to other wildlife species and habitat would be temporary. For habitats that would be affected, this would be considered a temporary adverse effect while the replacement habitats are being constructed, but a long-term beneficial impact once functions and values have been restored.

(8) Actions to Minimize Impacts (refer to Subpart H)

No-Action Alternative. No levee or infrastructure improvements would occur and, thus, there would be no actions to minimize effects due to the No-Action Alternative.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. Mitigation measures to minimize effects are described in detail in Sections 4.6, "Water Quality," and 4.7, "Biological Resources," of the EIS/EIR. The habitat creation plan is described in detail in Chapter 2, "Alternatives," and Section 4.7, "Biological Resources," of the EIS/EIR. Other minimization and conservation measures would be developed with USFWS, DFG, and NMFS through the consultation and permitting process prior to project construction.

f. Proposed Disposal Site Determinations

(1) Mixing Zone Determination (consider factors in section 230.11[f][2])

No-Action Alternative. No levee or infrastructure improvements would occur and, thus, there would be no effects to the mixing zones in or adjacent to the project area due to the No-Action Alternative.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. Mixing zones occur in the water column of the waterways adjacent to the Natomas Basin such as the Sacramento and American Rivers. The Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative do not involve placing fill materials within these zones. Additionally, as described in Section 4.6, "Water Quality," of the EIS/EIR, while both alternatives involve the continued discharge of drainage water from the interior of the Natomas Basin to the adjacent waterways, all applicable regulations regarding flow, duration, and water quality would be followed and no adverse affect would result to the mixing zone.

(2) Determination of Compliance with Applicable Water Quality Standards (present the standards and rationale for compliance or non-compliance with each standard)

No-Action Alternative. No levee or infrastructure improvements would occur and, thus, there would be no effects to compliance with applicable water quality standards due to the No-Action Alternative.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. As described in Section 4.6, "Water Quality," of the EIS/EIR, while both alternatives involve the continued discharge of drainage water from the interior of the Natomas Basin to the adjacent waterways, all applicable regulations regarding flow, duration, and water quality would be followed and no adverse affect would occur due to non-compliance with water quality standards. All applicable water quality permits would be obtained and followed during project construction.

(3) Potential Effects on Human Use Characteristics

No-Action Alternative, Adjacent Levee Alternative (Proposed Action), and Fix-in-Place Alternative. The project alternatives would not have any significant adverse effects to municipal and private water supply, recreational and commercial fisheries, or water-related recreation. There would be no national and historic monuments, parks, seashores, wilderness areas, research sites or similar preserves affected by the proposed project.

g. Determination of Cumulative Effects an the Aquatic Ecosystem (consider requirements in Section 230.11[g])

No-Action Alternative. No levee or infrastructure improvements would occur and, thus, there would be no cumulative effects to the aquatic ecosystem.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. There would be no significant cumulative effects on the aquatic ecosystem due to this project. As described above and in Sections 4.6, "Water Quality," and 4.7, "Biological Resources," of the EIS/EIR, the effects to aquatic

ecosystems are primarily temporary in nature and are not considered adverse effects to the aquatic ecosystem.

Permanent cumulative effects to the aquatic ecosystem, as described in detail in Chapter 5, "Cumulative and Growth Inducing Impacts and Other Statutory Requirements," of the EIS/EIR, would be replaced and improved or enhanced resulting in no net loss of ecosystem function, thus creating a cumulatively beneficial impact to the overall aquatic ecosystem in the Natomas Basin.

h. Determination of Secondary Effects on the Aquatic Ecosystem (consider requirements in Section 230.11[h])

No-Action Alternative. No additional secondary effects on the aquatic ecosystem would result from the No-Action Alternative.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. As described in Sections 4.6, "Water Quality," and 4.7, "Biological Resources," in the EIS/EIR, secondary effects on the aquatic ecosystem as a result of the Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative would consist of be beneficial in nature.

III. Findings of Compliance or Non-Compliance With the Restrictions on Discharge

a. Adaptation of the Section 404(b)(1) Guidelines to this Evaluation

No significant adaptations of the guidelines were made relative to this evaluation.

b. Evaluation of Availability of Practicable Alternatives to the Proposed Discharge Site Which Would Have Less Impact on the Aquatic Ecosystem (briefly discuss alternatives considered and that are available and practical and state why the one selected would result in the least amount of significant impacts. Reference should be made to other appropriate sections on alternatives in EIS or Main Reports when the 404 Evaluation is contained in these documents.)

A complete description of the Alternatives carried forward for analysis is contained in Chapter 2, "Alternatives," of the EIS/EIR.

Based on this analysis contained in Chapter 2, "Alternatives," of the EIS/EIR and the analysis above, conducted in adherence with the Clean Water Act Section 404(b)(1) Guidelines, the No-Action Alternative would not meet the overall project purpose of providing an adequate level of flood protection; therefore, it does not meet the 404(b)(1) Guidelines definition of practicability and does not meet the project's purpose and need. In addition, associated flood risks render this alternative contrary to the public interest. The Adjacent Levee Alternative (Proposed Action) is considered to be practicable and have the least potential for adverse environmental effects. As described in the discussion under "Aesthetics" and "Sight Feeders" above, the Fix-in-Place Alternative is considered to be practicable, but would have substantially greater adverse effects on riparian woodland/SRA habitat than the Adjacent Levee Alternative (Proposed Action). In addition, the Fix-in-Place Alternative would require reconstruction of the existing Garden Highway increasing traffic effects, in accordance with currently applicable roadway standards.

Mitigation of SRA associated with both the Adjacent Levee Alternative (Proposed Action) and the Fix-in-Place Alternative may not be feasible due to the lack of availability of appropriate aquatic habitat mitigation areas, though the effect is substantially more adverse under the Fix-in-Place Alternative. In conclusion, considering the alternatives carried forward for analysis in the EIS/EIR and this document, there is no practicable alternative to the Adjacent Levee Alternative (Proposed Action)

that would have less adverse effect on the aquatic ecosystem without other adverse environmental or public interest consequences.

Under the Adjacent Levee Alternative (Proposed Action), impacts on the aquatic ecosystem have been avoided or minimized to the maximum extent possible. All appropriate and practicable measures to minimize potential harm to the aquatic ecosystem have been incorporated into the project design. Based on this analysis, it is concluded that the Adjacent Levee Alternative (Proposed Action) constitutes the least environmentally damaging practicable alternative.

c. Compliance with Applicable State Water Quality Standards and

d. Compliance with Applicable Toxic Effluent Standard or Prohibition Under Section 307 of the Clean Water Act

No-Action Alternative. There would be no levee construction associated with the No-Action Alternative; therefore, no compliance would be required.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. As described in Section 4.6, "Water Quality," of the EIS/EIR, the proposed project would adhere to all applicable state water quality standards and comply with applicable toxic effluent standards or prohibitions under Section 307 of the Clean Water Act. In addition, implementation of Mitigation Measure 4.6-a, "Implement Standard Best Management Practices, Prepare and Implement a Stormwater Pollution Prevention Plan, and Comply with National Pollutant Discharge Elimination System Permit Conditions," and Mitigation Measure 4.6-b, "Implement Best Management Practices and Comply with NPDES Permit Conditions for a Point-Source Discharge," would ensure compliance with state or Federal water quality standards.

e. Compliance with Endangered Species Act (ESA) of 1973

No-Action Alternative. There would be no levee construction as a result of the No-Action Alternative, so no compliance with ESA would be required.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. As described in Section 3.7, "Biological Resources," and Section 4.7, "Biological Resources," of the EIS/EIR, both the Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative would have adverse effects (often through removal or fill) to habitat for Federally listed species and the potential for "take" of individuals. However, implementation of the NLIP programmatic conservation strategy in accordance with the Programmatic Biological Opinion (issued October 2009 by USFWS), and informal ESA Section 7 consultation through coordination with National Marine Fisheries Service, and implementation of Mitigation Measures 4.7-a through 4.7-l in the EIS/EIR, would ensure that adequate conservation, avoidance, and minimization measures are observed prior to, during, and after project construction to ensure compliance with the ESA.

f. Compliance with Specified Protection Measures for Marine Sanctuaries Designated by the Marine Protection, Research, and Sanctuaries Act of 1972

No-Action Alternative, Adjacent Levee Alternative (Proposed Action), and Fix-in-Place Alternative. There are no Designated Marine Sanctuaries in the vicinity of the Natomas Basin; therefore, there would be no adverse effect as a result of any of the alternatives.

g. Evaluation of Extent of Degradation of the Waters of the United States

(1) Significant Adverse Effects on Human Health and Welfare

No-Action Alternative. As described in Chapter 2, “Alternatives,” of the EIS/EIR, the No-Action Alternative would not provide an adequate levee of flood protection for the Natomas Basin and would have a significant adverse effect on human health and welfare should a flood event occur.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative. The proposed project would not cause significant adverse effect on human health and welfare, including municipal and private water supplies, recreation and commercial fishing. As described above, construction activities would not adversely affect benthic communities and plankton. There would be no adverse effects to fish, shellfish, wildlife or special aquatic sites. As described in Sections 4.6, “Water Quality,” and 4.7, “Biological Resources,” of the EIS/EIR, temporary impacts to water quality and aquatic diversity would be minimal at fill sites, during construction. Additionally, irrigation and drainage canals and ditches, managed marsh, woodland, upland row and field crop, native grassland, SRA, woodlands, and other wildlife associated habitat would be restored after project construction according to resource agency approved Mitigation and Monitoring Plans and in coordination with the resource agencies and TNBC. The proposed project would not significantly affect recreation or economic values as its inherent purpose is to provide flood protection for the residents of the Natomas Basin. Temporary effects to traffic, esthetics would occur during construction.

h. Appropriate and Practicable Steps Taken to Minimize Potential Adverse Impacts of the Discharge on the Aquatic Ecosystem

No-Action Alternative. No levee construction would occur under the No-Action Alternative, and therefore no discharge would occur. No steps would be needed to minimize potential adverse impacts of the discharge on the aquatic ecosystem because no adverse effect would occur.

Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative As described in Section 4.7, “Biological Resources,” of the EIS/EIR, both the Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative would have temporary adverse effects to the aquatic ecosystem during construction. These impacts would occur during the improvements and replacements of irrigation and drainage canals and ditches. Once improvements and replacements are complete, the adverse effects to these features would be restored and/or improved. There would be no permanent adverse effect. In addition, during construction, implementation of Mitigation Measures in Sections 4.6, “Water Quality,” and 4.7, “Biological Resources,” would ensure that all appropriate and practicable steps would be taken to minimize the potential adverse effects due to discharge on the aquatic ecosystem.

i. On the Basis of the Guidelines, the Proposed Disposal Site(s) for the discharge of fill material complies with the requirements of these guidelines.

Appropriate and practicable steps to minimize potential adverse effects of discharge and fill on the aquatic ecosystem include: placing fill material only where it is needed for the proposed project and confining it to the smallest practicable area. The areas disturbed by construction would be returned as close as possible to pre-project conditions.

On the basis of the guidelines, the proposed project is specified as complying with the inclusion of appropriate and practical conditions to minimize pollution or adverse effect on the aquatic ecosystem.

D5 Fish and Wildlife Coordination Act Report

United States Department of the Interior

FISH AND WILDLIFE SERVICE
Sacramento Fish and Wildlife Office
2800 Cottage Way, Room W-2605
Sacramento, California 95825-1846

In Reply Refer To:
81420-2011-CPA-0003

OCT 13 2010

Ms. Alicia Kirchner
Chief, Planning Division
U.S. Army Corps of Engineers, Sacramento District
1325 J Street
Sacramento, California 95814

Dear Ms. Kirchner:

This letter constitutes the Fish and Wildlife Service's (Service) Fish and Wildlife Coordination Act (FWCA) report, as provided for in section 2(b) of the FWCA (Public Law 85-624; 16 U.S.C. 661-667e) on the Natomas Levee Improvement Project, Phase 4b, Sacramento, California.

Project History

The entire project known as the Natomas Levee Improvement Program, Landside Improvements Project is being phased by the U.S. Army Corps of Engineers (Corps) and the Sacramento Area Flood Control Agency (SAFCA).

In 2005 and early 2006, SAFCA conducted assessments of seepage potential along the east levee of the Sacramento River, the south levee of the Natomas Cross Canal (NCC), and the north levee of the American River in its Natomas Levee Evaluation Study. This study concluded that approximately 26 miles of these levees protecting the Natomas Basin are in need of improvements to correct underseepage potential. In addition, levee height and seepage remediation improvements at some locations on the Sacramento River east levee, the NCC south levee, the Pleasant Grove Creek Canal, and the Natomas East Main Drainage Canal (NEMDC)/Steelhead Creek west levee are needed to provide adequate freeboard and subsequent protection from a 200-year flood. In 2006, the Corps recommended that the levees surrounding the Natomas Basin be decertified based on new geotechnical information and new standards. SAFCA is proposing to focus on segments that do not currently meet the 100-year design criteria adopted by the Federal Emergency Management Agency. The project has been broken up into four phases. Phase 1 included slurry wall work along a portion of the NCC, began in 2007, and completed in 2008. Phase 2 work began in 2009 and includes: levee raising and seepage remediation along the remainder of the NCC and Sacramento River east levee (Reaches 1-4B); relocation of the upper Elkhorn Canal; construction of the upper drainage

canal; habitat enhancement, creation and management; and right-of-way acquisition. Phase 3 work began in 2010 and includes: levee raising and seepage remediation along the Sacramento River levee (Reaches 5A-9B); relocation of the lower Elkhorn Canal; construction of the lower drainage canal; woodland corridor creation; levee raising, slope flattening and widening, and seepage remediation along the Pleasant Grove Creek Canal west levee; seepage remediation and slope stability remediation along the NEMDC west levee; infrastructure relocation and realignment; right-of-way acquisition; reconfiguration of Airport West Ditch; and landside vegetation removal of the Sacramento River east levee Reaches 10-12A. Phase 4a will begin in 2011 and includes: levee raising and seepage remediation along the Sacramento River east levee (Reaches 10-15); levee raising and seepage remediation along the NCC at the Northern and Bennett pumping plant locations; relocation of the Riverside Canal; pump plant modifications (both landside and waterside) or replacements; creation of managed marsh along Fisherman's Lake; creation of woodland corridor between Reaches 12A and 14; and right-of-way acquisition.

Project Description

The remaining portion of work is Phase 4b. Phase 4b work includes: the Sacramento River east levee south of the limits of the Phase 4a Project along Reach A:16–20 of the Sacramento River east levee, the American River north levee (Reach I:1–4), the PGCC (Reach E), the NEMDC west levee (Reaches F–H), improvements to the West Drainage Canal from I-5 to Fisherman's Lake, relocation of the Riego Road Canal along the NEMDC west levee, and relocation of the Vestal Drain and Morrison Canal along the NCC. This FWCA report is only reviewing and commenting on Phase 4b of the overall project.

Three alternatives were evaluated for the Natomas Levee Improvement Project, Phase 4b: No Action Alternative; Adjacent Setback Levee; and Fix-In-Place. Descriptions of the alternatives can be found in the Corps' *Natomas Levee Improvement Program, Phase 4b Landside Improvements Project Draft Environmental Impact Statement* (EIS), July 2010. The Corps and SAFCA have selected Alternative 1 as their preferred alternative.

Service Involvement

The Service has been working with the Corps and SAFCA on the Natomas Levee Improvement Project, Phase 4b for the last 6 months. The Corps initiated section 7 consultation under the Endangered Species Act in June 2010 and a biological opinion was signed on October 12, 2010.

Recommendations/Conclusions

Because the Corps and SAFCA have selected a preferred alternative and formal section 7 consultation has been initiated on this alternative, we are focusing our recommendations on the Adjacent Setback Levee. For a complete description of this alternative, refer to the EIS. The Corps and SAFCA have incorporated many project avoidance, minimization, and compensation measures within their project description. Given this, the Service is not recommending any additional compensation. The Service feels that effects to important habitats such as riparian woodland habitat will be mitigated for by creating 10 acres of woodland along the Sacramento River East Levee woodland corridor and creating 50 acres of riparian forest within the Lower Dry Creek area. Effects to aquatic habitat will be mitigated through the creation of enlarged canals throughout the project site and managed marsh at the Brookfield Borrow Site.

Based on our review of documentation available, the Service has the following recommendations in regards to the proposed project:

1) Minimize the impact on migratory birds by conducting pre-construction nesting surveys and avoiding construction at those sites where nests are found until the young have fledged the nest.

2) Replace the loss of any shaded riverine aquatic habitat that is lost as part of the Phase 4b project as proposed. In order to provide the same future function of this habitat, plantings should occur on the waterside of the levee and in the vicinity of the area of impact.

3) Include the Service when developing the planting plan for all habitat types created as a result of the project. Woodland areas should include a shrub component to create a complex woodland habitat structure.

4) Minimize impacts to northwestern pond turtles by having a qualified biologist conduct focused surveys for pond turtle nests, juveniles, and adults prior to and during construction activities in suitable upland nesting and aquatic habitat (upland areas within 1,640 feet of canals, ditches, emergent wetlands, and other permanent/semi-permanent aquatic habitat).

5) Complete the appropriate consultation with NOAA Fisheries, as required under section 7 of the Endangered Species Act, for potential impacts to listed anadromous fish and marine species under NOAA Fisheries jurisdiction.

6) Obtain a 2081 permit from the California Department of Fish and Game on State listed species.

7) Create an operations, maintenance, and monitoring plan for any habitat created as a result of the proposed project. This plan should be coordinated with the Service and the entity responsible for long-term maintenance of the site.

If you have any questions regarding this report or other aspects of the FWCA, please contact Jennifer Hobbs at (916) 414-6541.

Sincerely,

for M. Kathleen Wood
Assistant Field Supervisor

THE SACRAMENTO AREA FLOOD CONTROL AGENCY, AND
THE CALIFORNIA STATE HISTORIC PRESERVATION OFFICER

REGARDING THE ISSUANCE OF PERMISSION UNDER THE AUTHORITY OF SECTION 408 OF THE RIVERS AND HARBORS ACT OF 1899 AND SECTION 404 OF THE CLEAN WATER ACT FOR THE NATOMAS LEVEE IMPROVEMENT PROGRAM, LANDSIDE IMPROVEMENTS PROJECT

WHEREAS, the U.S. Army Corps of Engineers, Sacramento District (Corps) proposes to review an application that seeks permission for alteration of flood control structures under the authority of Section 408 of the Rivers and Harbors Act and to issue one or more permits to discharge fill to the waters of the United States under the authority of Section 404 of the Clean Water Act to the Sacramento Area Flood Control Agency (SAFCA) for the Natomas Levee Improvement Program Landside Improvements Project (Project); and

WHEREAS, The Corps has determined that the issuance of these permissions and permits constitute an undertaking per 36 CFR 800.16(y), which require compliance with Section 106 of the National Historic Preservation Act (NHPA) of 1966 as amended (16 U.S.C. 470f); and

WHEREAS the Project includes improvements to an extensive levee system surrounding the Natomas Basin and landscape and irrigation/drainage infrastructure modifications that will be implemented in three construction phases, currently scheduled for 2008, 2009, and 2010; and

WHEREAS, the Corps has determined that this undertaking will have an adverse effect on at least one Historic Property that has been determined eligible for inclusion in the National Register of Historic Places (NRHP), CA-SAC-485/H; and

WHEREAS, because of the complex and phased nature of the improvements, the Corps has not yet determined the exact area of potential effects (APE), nor has SAFCA acquired all of the rights-of-entry, easements and ownership interests that would allow a complete inventory and determination of effects on Historic Properties; and

WHEREAS, the Natomas Basin is sensitive for buried archaeological resources that cannot be accurately located prior to construction; and such buried sites may also be Historic Properties, and therefore SAFCA and the Corps need to document a framework for managing post-review discoveries per 36 CFR Section 800.13, including evaluation of those resources, assessment of effects, and resolution of potential adverse effects; and

WHEREAS, at such time as any unevaluated cultural resource may be discovered, it may require archaeological data recovery and/or other historic preservation activities, in compliance with Section 106 of the National Historic Preservation Act, concurrent with *active* construction; and

WHEREAS, the urgency of flood control improvements require a management framework for Historic Properties that will be implemented after the execution of this agreement in an expedited manner that thus departs from the process normally used under 36 CFR Section 800 et seq., yet still fulfills the requirements of Section 106 of the NHPA; and

WHEREAS, SAFCA has been invited to participate as a signatory to this Programmatic Agreement (PA) by the Corps and the California State Historic Preservation Officer (SHPO; and

WHEREAS, the Corps has consulted The Ione Band of Miwok Indians, the Shingle Springs Band of Miwok Indians and the United Auburn Indian Community, and they have been invited to concur in this PA; and

WHEREAS, the Corps shall make the terms and conditions of this PA as part of the conditions of any permissions and permits issued by the Corps for this project; and

WHEREAS, SAFCA has agreed to undertake responsibility for compliance with the NHPA on its own behalf, and on behalf of the Central Valley Flood Protection Board; and

WHEREAS, the Corps has consulted with the SHPO and the Advisory Council on Historic Preservation in accordance with regulations implementing Section 106 of the NHPA;

WHEREAS, the Council has been consulted and declined to participate in this agreement;

NOW, THEREFORE, the Corps, the SHPO, and SAFCA agree that the Project shall be implemented in accordance with the following stipulations in order to take into account the effects of the undertaking on Historic Properties.

The Corps shall ensure that the following stipulations of this PA are carried out.

STIPULATIONS

I. DEFINITIONS

The terms used in this Programmatic Agreement shall be as defined in regulations implementing Section 106 of the NHPA, and as follows:

"APE (Area of Potential Effect)" means any location at which any Project development activity will be constructed; and locations of any Project-related construction staging areas, borrow areas, and materials stockpile areas; and the locations of any other Project development activities. The APE shall be defined so as to include the maximum spatial dimensions of all Project-related construction and operations rights-of-way, easements, areas which potentially may be affected by Project activities, and other properties to which SAFCA has access, whether on a temporary or permanent basis, or ownership for Project development.

"Concurring parties" means their concurrence indicates that they are in agreement with the terms of the PA.

"Consulting parties" means the Corps, the SHPO, and SAFCA who are signatories to this PA. Only signatories have the authority to amend or terminate this PA.

"Cultural resources" means any property or location that was created, modified, or used by people at least 50 years in the past. Cultural resources include but are not limited to Historic Properties and traditional cultural properties/places (i.e., NRHP listed or eligible properties as defined at 36 CFR Part 60).

"Historic Property" means a cultural resource that has been determined eligible for or is listed on the NRHP (i.e., NRHP listed or eligible properties as defined at 36 CFR Part 60), either by formal nomination

and listing or by concurrence between federal agencies and the SHPO.

"Historic preservation" means any activity conducted in accordance with the NHPA and its implementing regulations to, among other things, inventory, evaluate, manage, or treat cultural resources such as buildings, structures, sites, districts, and objects eligible for, or that may be determined eligible for, listing in the NRHP according to eligibility criteria at 36 CFR Part 60.

"Project development activities" means any physical action related to the Project that has the potential to damage or otherwise alter those characteristics of Historic Properties that would make them eligible for listing in the NRHP.

II. STANDARDS

(A.) Professional Qualifications. All technical work required for historic preservation activities implemented pursuant to this Programmatic Agreement shall be carried out by or under the direct supervision of a person or persons meeting at a minimum the *Secretary of Interior's Professional Qualifications Standards* for archaeology or history, as appropriate (48 FR 44739). "Technical work" here means all efforts to inventory, evaluate, and perform subsequent treatment such as data recovery excavation or recordation that is required under this Programmatic Agreement. This stipulation shall not be construed to limit peer review, guidance, or editing of documents by SAFCA or SAFCA's consultants.

(B.) Historic Preservation Standards. Historic preservation activities carried out pursuant to this Programmatic Agreement shall meet the *Secretary of Interior's Standards and Guidelines for Archaeology and Historic Preservation* (48 FR 44716-44740) as well as standards and guidelines for historic preservation activities established by the SHPO. The Corps shall ensure that all reports prepared pursuant to this Programmatic Agreement will be provided to the consulting parties and shall ensure that all such reports meet published standards of the California Office of Historic Preservation, specifically, *Preservation Planning Bulletin* Number 4(a), "Archaeological Resources Management Reports (ARMR): Recommended Contents and Format" (December 1989).

III. PROJECT DESCRIPTION

(A) PROJECT Description. A description of the Project is found in the Final Environmental Impact Report (November 2007). A summary of the Project's description in the environmental impact report is provided as **Attachment A** and is made a part of this Programmatic Agreement.

(B) Existing Conditions. An archival search and archaeological survey have been completed for all areas of the APE as currently defined to which SAFCA currently has access, and which currently are not covered by paving, built environment features, or agricultural crops. A report of the results of archival research and archaeological survey, "Cultural Resources Inventory Reports, Part 1 – Natomas Levee Improvement Program Landside Improvements Project, Sacramento and Sutter Counties, California" (October 2007) is made **Attachment B** to this Programmatic Agreement.

A number of prehistoric sites are known to be present along the banks of the Sacramento River. However, archaeological survey of the area is of limited value because the alluvial depositional environment may obscure and bury sites, leaving no surface manifestation of those archaeological resources. For most of the length of the Project, levees have been built on the riverbanks. These levees are one focus of the Project's activity, and occupy a substantial portion of the Project's APE. Furthermore, it has not been established

whether certain known sites in proximity to the Project's development activities extend under the existing levees. The existing levees both obscure ground surfaces and prevent subsurface archaeological testing within their footprints. Because of these conditions, a full assessment of archaeological sites that may be present in the APE cannot be made in advance of construction. There is no definitive information, even for sites known to be in Project's proximity, of site boundaries relative to the APE, or of the significance or integrity of any portions of such sites that may be within the APE. For these reasons, even though archaeological deposits may extend into the APE, and even though some of these deposits may qualify as Historic Properties, it is impossible to develop meaningful site-specific Historic Properties Treatment Plans (HPTP) prior to all construction, or to carry out all necessary data recovery in advance of the Corps' approvals, permitting and construction.

For these reasons, unforeseen discoveries shall be treated pursuant to the provisions of 36 CFR 800.13 (Post-review discoveries).

(C) Project Phasing and Potential Changes to the APE: Because the improvements will occur in three phases (anticipated to be 2008, 2009, and 2010), it will be necessary to define the APE for each phase. The APE for each phase shall be submitted with the cultural resources inventory reports, and shall be consulted upon as part of that document, pursuant to **Stipulation IV**, below.

After the initial concurrence, changes to the APE may be necessary as SAFCA refines its phased Project plans. In particular, the ability of SAFCA to obtain access permissions of private landowners, determination of borrow sites and ongoing negotiations with resource agencies regarding species mitigation requirements may affect final Project's design, and may expand the current APE in some areas. Any changes to the APE shall be made in accordance with subsections D and E (below) of this Stipulation III. The SHPO, Corps, and SAFCA shall consult and reach concurrence in any changes to the APE. The final APE shall account for all Project development activities for the as-built Project. SAFCA shall notify the Corps of any change in the APE and the Corps shall determine the potential for Project development activities in a revised APE to affect cultural resources, through cultural resources inventory and testing as needed.

(1) If there is the potential that cultural resources exist in the revised APE, SAFCA shall submit to the Corps:
   (a) a map of the revised APE; and
   (b) a description of Project development activities to take place in the revised APE; and
   (c) a description of the inventory, nature, location, and known or potential significance of cultural resources in the revised APE; and
   (d) a description of any archaeologically sensitive areas in the revised APE that require monitoring by an archaeologist, and Native American monitor as appropriate; and
   (e) a plan for managing cultural resources in a manner that either avoids Project-related effects to cultural resources, or which mitigates any adverse effects, and which provides for the management of unforeseen cultural resources discoveries.

(2) If no cultural resources are identified within a revised APE, SAFCA shall document such a determination, provide documentation to the Corps and keep such documentation on file at its principal offices.

After the Corps and SAFCA agree to a revised APE and if such a change has the potential to have an effect on cultural resources, the Corps shall submit the documentation to the SHPO for their review. The SHPO

shall have 30 calendar days from the date of receipt of the notice of a revision to the APE to review and to provide in writing either concurrence with or objection to the definition of the revised APE, and any proposed historic preservation activities. Should the SHPO not respond in writing within 30 calendar days, the Corps and SAFCA shall proceed as though the SHPO has concurred in the revised APE, and the proposed historic preservation activities, if any

Should the SHPO object to the definition of the revised APE or proposed historic preservation activities, the Corps, SAFCA, and the SHPO shall consult for a period not to exceed 15 calendar days following the date of the receipt of the SHPO's written objection in an effort to come to agreement on the issues to which the SHPO has objected. Should the SHPO, the Corps, and SAFCA be unable to agree on the issues to which the SHPO has objected, the consulting parties to this Programmatic Agreement shall proceed in accordance with **Stipulation VIII (Resolving Objections)**, below.

(D) Scope of Identification Efforts in the APE: Inventories of Historic Properties within the established or revised APE shall be completed in accordance with **Stipulation IV (Inventory of Historic Properties)** of this Programmatic Agreement. Treatment of any adverse effects to Historic Properties within the established or revised APE shall be completed in accordance with **Stipulation V (Treatment of Effects)** of this Programmatic Agreement.

(E) Scope of the APE: For purposes of this Programmatic Agreement, a revised APE shall be defined to meet, at a minimum, the following criteria:

(1) The APE for any segment of the Natomas levees that are being improved as part of the Project and shall include the levee segment and a corridor extending not less than 75 feet from the land side toe of the levee segment. The APE also shall include:

- The extent of all Project construction and excavation activity required to construct flood control facilities and to modify irrigation and drainage infrastructure,
- The additional right-of-way/easements obtained by SAFCA as part of the Project's features,
- All areas used for excavation of borrow material and habitat creation, and
- All construction staging areas.

(2) The APE for Project activities shall include the direct footprint of the activity and a reasonable buffer determined by consultation between SAFCA and the Corps, according to the nature of the activity, SAFCA's ownership interest or easement, and the probability that ground-disturbing work may extend beyond the footprint of planned improvements and activities.

(3) The APE for any other type of Project development activities shall be defined by the Corps in consultation with the consulting parties.

IV. INVENTORY OF HISTORIC PROPERTIES

(A) Identification Efforts to Date and Further Work Required: An inventory of Historic Properties within the APE has been initiated consistent with the *Secretary of Interior's Standards and Guidelines for Archeology and Historic Preservation* (48 FR 44716–44740). The SAFCA shall submit a completed inventory and evaluation for each phase of Project work (2008, 2009, 2010) to the Corps. Such inventory shall be deemed complete by the Corps when the SHPO concurs in the NRHP eligibility recommendation for all cultural resources within the APE for that phase.

Areas of Archaeological Sensitivity: Areas of archaeological sensitivity will be monitored in accordance with HPTPs.

(C) Changes in the APE: If areas are added to the Project development activities subsequent to the SHPO concurrence on the map of the APE for a specific phase, SAFCA shall complete an inventory of Historic Properties within the expanded APE. Such inventory shall be undertaken and completed consistent with the *Secretary of Interior's Standards and Guidelines for Archeology and Historic Preservation* (48 FR 44716–44740). Such inventory shall be deemed completed by the Corps at such time as the SHPO concurs in the NRHP eligibility of all cultural resources within the established and revised APE for the Project, pursuant to this Stipulation IV.

V. TREATMENT OF EFFECTS

(A) Historic Property Treatment Plans: If Historic Properties are identified in cultural resources inventories that would be adversely affected by the Project, SAFCA shall prepare a Historic Properties Treatment Plan (HPTP) for review and written approval by the Corps and the SHPO for those specific properties. An HPTP applicable to every Historic Property that may sustain adverse effects by the Project shall be prepared, including for those Historic Properties found during construction. An HPTP may address individual or multiple Historic Properties. An HPTP shall stipulate those actions SAFCA shall take to resolve the adverse effects of the Project on Historic Properties. SAFCA shall ensure that all provisions of an HPTP are carried out in a timely manner. Any changes to an HPTP shall be reviewed and approved by the Corps. Copies of all reports pertaining to the treatment of Historic Properties shall be submitted to the consulting parties to this Programmatic Agreement. Reports and other data pertaining to the inventory of, and treatment of effects on, Historic Properties may be distributed to concurring parties to this Programmatic Agreement and to other members of the public consistent with **Stipulation VII (Confidentiality)** of this Programmatic Agreement. Individual HPTPs may be submitted simultaneously with the cultural resources inventory report for specific Project phases. If HPTPs are submitted simultaneously with an inventory report for a Project phase or with an addendum to such report for an expanded APE or Project description, the Corps and SHPO review period for such HPTP shall run concurrently with the review period for the inventory report.

Review Schedule: The SHPO and the Corps shall have 30 calendar days to review and comment upon in writing any HPTP submitted by SAFCA. The SHPO and the Corps shall indicate in their review that they find the HPTP either acceptable or not. In the event that comments are not made by the SHPO within 30 calendar days, the Corps shall assume the SHPO has accepted the HPTP as submitted. In the event the Corps and/or the SHPO provide written comment within the 30-day period, either SAFCA shall accept the comments and revise the HPTP accordingly, or SAFCA and the Corps may object to some or all comments. Comments from the Corps or the SHPO that are not acceptable to SAFCA shall be resolved by consultation among the Corps, the SHPO, and SAFCA for a period of not more than 15 calendar days. Should the Corps, the SHPO, and SAFCA be unable to resolve any dispute regarding the Corps or the SHPO comments, the consulting parties shall proceed in accordance with **Stipulation VIII (Resolving Objections)** of this Programmatic Agreement.

The Corps shall submit to the SHPO for review and comment any amendment, addendum, revision or other change to an HPTP. SAFCA shall proceed to make changes to an HPTP as per the procedure and schedule for the review and approval of an original HPTP. If a Historic Property is discovered within an expanded APE subsequent to an initial inventory effort for a phase, and the Corps and SAFCA agree that

the Project may adversely affect the property, SAFCA shall submit an addendum to the HPTP or a new HPTP. The review schedule for this submittal follows the provisions of Stipulation V.

(B) Commencement of Construction and Project Work: Project development activities may commence within the APE after a Historic Properties inventory has been completed (per **Stipulations III and IV**, above), and prior to treatment of adverse effects on Historic Properties within the APE provided that:

(1) A plan to respond to inadvertent archaeological discoveries is prepared by SAFCA and approved by the Corps prior to the commencement of Project activities anywhere in the APE for that phase of the Project; and

(2) Project development activities do not encroach within 30 meters (100 ft) of the known boundaries of any Historic Property as determined from archaeological site record forms, other documentation, or as otherwise defined in consultation with the SHPO; and

(3) An archaeological monitor is present during any Project activities that are anticipated to extend either vertically or horizontally into any areas designated to be archaeologically sensitive by SAFCA in consultation with the Corps.

(C) Final Report Documenting Implementation of the Historic Properties Treatment Plan(s): Within one year after the completion of all work performed as part of the Project SAFCA shall submit to the Corps and SHPO a final report documenting the results of all work prepared under the HPTPs. This report shall be submitted to the Corps and SHPO for review and comments, which SAFCA shall incorporate.

VI. NATIVE AMERICAN AND OTHER PUBLIC CONSULTATION AND PUBLIC NOTICE

Members of the interested public shall be invited to consult regarding this Programmatic Agreement. Within 30 calendar days of the signing date of this Programmatic Agreement, the Corps, the SHPO, and SAFCA shall consult to compile a list of members of the interested public who shall be provided notice of this Programmatic Agreement. The opinions of local Native Americans with cultural ties to the APE and the opinions of other members of the public shall be taken into account by the consulting parties for historic preservation actions taken in accordance with this Programmatic Agreement. Native Americans and other members of the public may be invited to concur in this Programmatic Agreement. Native American monitor(s) shall be invited to assist SAFCA in the treatment of any Native American human remains and items associated with Native American burials discovered during the Project in accordance with California Public Resources Code Section 5097.98 and California Health and Safety Code Section 7050.5(b) and 7050.5(c).

VII. CONFIDENTIALITY

Confidentiality regarding the nature and location of the archaeological sites and any other cultural resources discussed in this Programmatic Agreement shall be maintained on a "need-to know" basis limited to appropriate personnel and agents of SAFCA, the Corps, and the SHPO involved in planning, reviewing and implementing this Programmatic Agreement consistent with Section 304 of the NHPA.

VIII. RESOLVING OBJECTIONS

(A.) Should any party to this Programmatic Agreement object to any action proposed or carried out

pursuant to this Programmatic Agreement, the Corps shall consult with the objecting party(ies) for a period of time not to exceed *30 calendar days* to resolve the objection. If the Corps determines that the objection cannot be resolved, the Corps shall forward all documentation relevant to the dispute to the Council. Within 30 calendar days after receipt of all pertinent documentation, the Council shall either:

(1) Provide the Corps with recommendations, which the Corps shall take into account in reaching a final decision regarding the objection; or

(2) Notify the Corps that the Council will comment in accordance with the requirements of Section 106 of the NHPA, and proceed to comment. Any Council comment provided in response shall be taken into account by the Corps, pursuant to the requirements of Section 106 of the NHPA.

(3) Should the Council not exercise one of the above options within 30 days after receipt of all pertinent documentation, the Corps may assume the Council's concurrence in its proposed response to the objection.

(4) The Corps shall take into account any Council recommendation or comment provided in accordance with this stipulation with reference only to the subject of the objection; the Corps' responsibility to carry out all actions under this Programmatic Agreement that are not the subjects of the objection shall remain unchanged.

(B.) At any time during implementation of the measures stipulated in this Programmatic Agreement should an objection pertaining to the Programmatic Agreement be raised by a member of the public, the Corps or SAFCA shall notify the consulting parties to the Programmatic Agreement and take the objection into account, consulting with the objector and, should the objector so request, with any of the consulting parties to this Programmatic Agreement to address the objection.

IX. AMENDMENTS

Any consulting party to this Programmatic Agreement may propose that the Programmatic Agreement be amended, whereupon the Corps shall consult with the other consulting parties to this Programmatic Agreement to consider such amendment. Any amendment shall be executed by the consulting parties in the same manner as the original Programmatic Agreement.

If the Project has not been completed within five years of the date of the execution of this Programmatic Agreement, the consulting parties shall consult on a date not less than 90 days prior to the fifth anniversary of this Programmatic Agreement to either amend this Programmatic Agreement and acknowledge its continued applicability for the undertaking for a designated period of time, or terminate this Programmatic Agreement and proceed to again consult regarding the undertaking in accordance with regulations implementing Section 106 of the NHPA.

All attachments to this Programmatic Agreement, and other instruments prepared pursuant to this agreement such as, but not limited to, the Project's description, initial cultural resource inventory report and maps of the APE, HPTPs, and monitoring and discovery plans may be amended without requiring amendment of this Programmatic Agreement. Such amendments will be consulted on by the concurring parties and shall be final when agreement is reached by the parties.

X. FAILURE TO CARRY OUT THE TERMS OF THE AGREEMENT

Should the Corps fail to ensure that the terms of this Programmatic Agreement are carried out, the Corps shall notify the parties to this Programmatic Agreement and again consult with the SHPO and the Council in accordance with regulations implementing Section 106 of the NHPA. The Corps shall not take any action or make any irreversible decision that would affect an Historic Property, preclude historic preservation alternatives, or foreclose any opportunities for the Council to comment on the undertaking prior to completion of the process for considering and resolving effects on Historic Properties provided in this document.

XI. SCOPE OF THE PROGRAMMATIC AGREEMENT

Execution of this Programmatic Agreement by the Corps, the SHPO, and SAFCA, and implementation of its terms, evidence that Corps has afforded the Council an opportunity to comment on the undertaking for SAFCA Natomas Levee Improvement Program Landside Improvements Project, pursuant to 16 U.S.C. 470f, and that the Corps has taken into account the effects of the undertaking on Historic Properties. This Programmatic Agreement is limited in scope to the undertaking defined herein and is entered into solely for that purpose.

RE: Natomas Levee Improvement Project

Dear Ms. Pilas-Treadway:

EDAW is conducting cultural resources studies for the above-referenced project located generally north of the City of Sacramento, in Sacramento and Sutter counties, and located on the Grays Bend, Taylor Monument, Verona, Rio Linda, Pleasant Grove, Sacramento East, and Sacramento West USGS quadrangle maps. Background research and field studies conducted for this project will identify cultural resources that may be impacted by proposed levee improvements throughout the American River basin. This letter is intended to initiate part of the consultation process that will eventually be required under Section 106 National Historic Preservation Act.

I am pleased to bring this activity to your attention, and would appreciate any information you can provide regarding prehistoric, historic, or ethnographic Native American land use. I am interested in any contemporary Native American values that may be present near or within the project area and would like to request a search of the NAHC Sacred Land files.

Please send via mail or facsimile (916-414-5850) a listing of local Native American representatives at your earliest convenience, so that I may contact appropriate individuals and account for their potential concerns in the planning process.

If you have any questions or comments feel free to contact me at my office. I can be reached by email at charlane.gross@edaw.com, or by phone at 916-414-5800. I look forward to hearing from you soon.

Sincerely,

Charlane Gross, M.A., R.P.A.

RE: Natomas Levee Improvement project, Sacramento and Sutter Counties

Dear Ms. Gross:

The Native American Heritage Commission has reviewed the Sacred Lands File and found several burial/recorded sites in/near the project area. The location of sites is confidential.

I recommend that you contact the North Central Information Center, Ca State University, Sacramento, 6000 J Street, Adams Building, Suite 103, Sacramento, CA 916-278-6217 for sites in Sacramento County and Northeast Information Center, Ca State University, Chico, Building 25, Suite 204, Chico, CA 95929, 530-898-4413 for Sutter County, for further information of recorded sites located in/near the APE.

I have enclosed a list of Native Americans individuals/organizations contacts may have knowledge of additional cultural resources in the project area. The Commission makes no recommendation or preference of a single individual, or group over another. These lists should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated, if they cannot supply information, they might recommend other with specific knowledge. A minimum of two weeks must be allowed for responses after notification.

If you receive notification of change of addresses and phone numbers from any these individuals or groups, please notify me. With your assistance we are able to assure that our lists contain current information. If you have any questions or need additional information, please contact me at (916) 653-4038.

If you have any questions or need additional information, please contact me.

Sincerely,

Debbie Pilas-Treadway

Subject: Natomas Levee Improvement Project(s)

To Whom It May Concern:

EDAW, Inc., an environmental firm, has been retained to complete an Environmental Impact Report (EIR) for various SAFCA (Sacramento Area Flood Control Agency) levee improvement projects throughout the American River Basin in both Sacramento and Sutter Counties (see attached map). There are few specific planned improvements as yet, but the projects may include levee strengthening or widening, excavation for slurry walls or canals, soil removal from various borrow sites throughout the basin, and similar types of projects. The work will be conducted over the next several years, but EDAW is collecting cultural resources information now to help guide planning decisions made for the individual elements of this much larger effort.

We would appreciate your help in identifying any concerns you or your community may have regarding any cultural resources in the study area. Please return the enclosed response form. Returning this form does not imply that you approve or disapprove of the study, nor does it limit your opportunity to comment at a later time. Efforts to address your concerns will be included in the planning process.

In order to incorporate your concerns and/or input in any forthcoming reports, we would appreciate receiving your comments by July 10th.

If you have questions, please contact me at (916) 414-5800.

Sincerely,

Charlane Gross, M.A., RPA
Senior Archaeologist

PROJECT SUMMARY

ENCLOSURE 3

DESCRIPTION OF THE SACRAMENTO AREA FLOOD CONTROL AGENCY'S NATOMAS LEVEE IMPROVEMENT PROGRAM LANDSIDE IMPROVEMENTS PROJECT

PURPOSE AND NEED

PROJECT OVERVIEW

The Natomas Levee Improvement Program (NLIP) Landside Improvements Project proposed by the Sacramento Area Flood Control Agency (SAFCA) is intended to provide urgently needed flood control system improvements to the Natomas Basin in southern Sutter and northern Sacramento Counties, California (Exhibit 1). The project would improve the levee system that protects the 53,000-acre Natomas Basin, including a portion of the city of Sacramento. The Natomas Basin is bounded by leveed reaches of the Natomas Cross Canal (NCC) on the north, the Sacramento River on the west, the American River on the south, and the Pleasant Grove Creek Canal (PGCC) and Natomas East Main Drainage Canal (NEMDC)/Steelhead Creek on the east (Exhibit 1).

SAFCA's intent is to provide the Natomas Basin with at least a 100-year level of flood protection by the end of 2010 and a "200-year" level of protection by the end of 2012. Achievement of these aims would significantly reduce the risk of an uncontrolled flood in the Natomas Basin that would result in a catastrophic loss of property (estimated at $7 billion) and a prolonged interruption of commercial activity, including the operation of Sacramento International Airport (Airport) and closure of Interstate 5 (I-5) and State Route (SR) 99/70. Flooding is particularly hazardous in a heavily urbanized basin like Natomas because of the depths that floodwaters can reach—more than 10 feet in some areas.

DEFICIENCIES OF THE NATOMAS LEVEE SYSTEM AND PROPOSED REMEDIES

Approximately 26 miles of the NCC south levee, the Sacramento River east levee, and the PGCC west levee require one or more forms of remediation to address the potential for failure in a 100-year or "200-year" flood event, as follows:

- Inadequate freeboard—The NCC south levee and portions of the Sacramento River east levee must be raised to provide at least 3 feet of freeboard above the 100-year water surface elevation, and several reaches of the Sacramento River east levee must be raised to provide 3 feet of freeboard above the "200-year" design water surface elevation.

- Underseepage and through-seepage vulnerability—Most of these same reaches do not meet recently adopted federal criteria for safely containing underseepage and through-seepage when the water surface in the adjacent channel reaches the 100-year elevation or, in some cases, the "200-year" elevation.

Underseepage problems can occur where levees are constructed on low-permeability foundation soil (silt and clay) underlain by a layer of higher permeability (sand and gravel). Excessive underseepage makes the levee susceptible to failure during periods of high river stage. Under these conditions, seepage travels horizontally under the levee and then is forced vertically upward through the low-permeability foundation layer, often referred to as a "blanket." Failure of the blanket can occur either by uplift, a condition in which the blanket does not have enough weight to resist the confined pressure acting on the bottom of the blanket, or by piping (internal erosion) caused by water flowing under high vertical gradients through the erodible blanket and carrying fine soil particles out of the foundation materials. Through-seepage is seepage through a levee embankment that can occur during

periods of high river stage. Depending on the duration of high water and the permeability of embankment soil, seepage may exit the landside face of the levee. Seepage can also pass directly through pervious layers in the levee if such layers are present. Under these conditions, the stability of the landside levee slope may be reduced.

The project encompasses addressing freeboard deficiencies through levee raises; addressing seepage potential using a combination of seepage berms, cutoff walls, and relief wells; and acquiring additional right-of-way to construct the improvements and to prevent encroachment into the flood control system. In addition, the project has been designed to include an enlarged levee embankment (adjacent setback levee) along the land side of the existing Sacramento River east levee to preclude the need for substantial removal of vegetation and structural encroachments on the water side of this levee in compliance with U.S. Army Corps of Engineers (Corps) guidance. These improvements would include recontouring the levee slopes where necessary.

The following subsections summarize the methods to address freeboard deficiencies and seepage potential, which will be used in various combinations on the NCC south levee, Sacramento River east levee, and the PGCC west levee.

Levee Raises

The freeboard increases would be accomplished through raises of the existing NCC south levee or through construction of the raised adjacent setback levee adjacent to the existing Sacramento River east levee:

- Raise of existing levee (NCC south levee). A full levee raise is required for the NCC south levee, consisting of an embankment raise from the landside or waterside toe (or both) upward to the increased levee crown elevation. This requires partially excavating the levee slope to provide a working platform for equipment, typically 10 feet wide, and rebuilding the levee to the appropriate elevation by benching the new embankment material into the existing embankment material.

- Adjacent setback levee (Sacramento River east levee). The levee raise of the Sacramento River east levee would be accomplished through the construction of an "adjacent setback levee" adjoining the Sacramento River east levee. The adjacent setback levee would be constructed with a crown elevation 3 feet above the "200-year" water surface profile. In the upper reaches, where the existing levee has freeboard deficiencies of as much as 3 feet, the crown of the adjacent setback levee would be higher than the existing levee and Garden Highway roadway. In the lower reaches, where the existing levee has sufficient freeboard, the adjacent setback levee would be the same height as the existing levee.

Seepage Berms

Seepage berms are wide embankments placed outward from the landside toe of the levee to lengthen the underseepage path, thereby lowering, to acceptable levels, the erosive potential of seepage passing through permeable layers under the levees. Seepage berms typically extend 100 to 400 feet from the levee. The berm thickness depends on the severity of the seepage pressure, but generally berms are 5 feet thick near the landside toe and taper to a thickness of 3 feet at the prescribed distance from the toe. A seepage collection ditch is often constructed at the landward toe of all seepage berms. Seepage berms are planned for construction along portions of the Sacramento River east levee and the PGCC west levee.

Cutoff Walls

Conventional slurry cutoff walls are typically constructed using an excavator with a long-stick boom capable of digging a trench to the maximum required depth. Bentonite slurry is pumped into the trench during trench excavation to prevent caving. The soil, cement, and bentonite are mixed to achieve the required cutoff wall strength and permeability, and the mixture is backfilled into the trench. Select fill is used to rebuild the levee. The NLIP includes construction of cutoff walls along portions of the NCC south levee and the Sacramento east levee. Cutoff wall construction may also be required in some areas along the PGCC west levee.

For the NCC south levee, preparation for construction of the cutoff wall would begin with using scrapers (or other suitable equipment, depending on the slope) to clear and grub/strip the surface to a depth of 2 inches to remove low-growing vegetation, loose stone, and surface soils. The aggregate base from the operating road also would be removed and stockpiled for later reuse. Waste material would be hauled to an off-site location.

Construction of the cutoff wall would include degrading the existing levee to a depth equal to one-half its total height (approximately 9 feet). A 70-foot-deep cutoff wall would be constructed for the total length of 23,150 lineal feet, with the method of installation at the contractor's discretion. Material degraded to support cutoff wall construction would be compacted at the landside toe of the levee to support raising portions of the NCC south levee. Unsuitable material generated from cutoff wall construction would be disposed of off-site. Equipment that would be used in phases of the cutoff wall construction includes excavators, scrapers, loaders, bulldozers, rollers, haul trucks, water trucks, hydroseeding trucks, pickup trucks, slurry pumps, and generators.

Work on the Sacramento River east levee includes construction of an adjacent levee with construction of a cutoff wall to occur in several reaches of the adjacent levee. Borrow material would be excavated from several locations in the project area and would be delivered to the levee construction sites by scrapers or haul trucks where it would be spread by motor graders and compacted by sheepsfoot rollers to build the adjacent levee up to a height equal to about two-thirds of the height of the existing levee. This would create a working platform for cutoff wall installation using an excavator with a long-stick boom capable of digging a trench to a maximum depth of approximately 80 feet. Bentonite slurry would be pumped into the trench during excavation to prevent caving. The soil excavated from the trench would be mixed with bentonite and backfilled into the trench to create the cutoff wall.

Relief Wells

Relief wells provide protection against levee underseepage by providing a path for underseepage to exit to the ground surface at the landside toe of the levee without creating sand boils or piping levee foundation materials. Relief wells are an option for addressing underseepage in reaches where continuous sand and gravel layers have been identified by the geotechnical analysis.

Relief wells are constructed near the levee landside toe to provide pressure relief beneath surficial fine-grained soils. The wells are constructed using soil boring equipment to bore a hole vertically through the fine-grained blanket layer and into the coarse-grained aquifer layer beneath. Pipe casings and filters are installed to allow the pressurized water to flow to the ground surface, thereby relieving the pressures beneath the clay blanket. Relief wells either may discharge onto open ground or may require conveyance to a stormwater drainage system or a pump station. Relief wells cause the least amount of construction disturbance but require routine maintenance of the wells themselves and the drainage and pumping facilities necessary to support them.

EXISTING PROJECT FACILITIES AND POTENTIAL BORROW SITES

All project construction activities would take place within the Natomas Basin, except for the development of a borrow site on Reclamation District (RD) 1001 land northeast of the basin (Exhibit 2). The following sections describe the existing flood control facilities, their general setting, and adjacent irrigation infrastructure and the potential borrow sources. These features, as well as the borrow locations, constitute the physical infrastructure and locations where the project may result in effects on historic properties.

Flood Control and Irrigation Facilities

Natomas Cross Canal South Levee

The NCC is a 5.3-mile-long channel that carries water from several tributary watersheds in western Placer County and eastern Sutter County to the Sacramento River. The NCC begins at the PGCC and East Side Canal and extends southwest to its confluence with the Sacramento River near the Sankey Road/Garden Highway

intersection. During periods of flooding, the Sutter Bypass, Sacramento River, and NCC all contribute to raised water elevations that can affect the NCC levees. For engineering purposes, the levee is divided into seven reaches. Much of the south levee contains an existing stability berm with an internal drainage system. An approximately 80- to 100-foot maintenance access area extends along the land side of the levee through most of the NCC's length.

Farms and rural residences are located on both sides of the NCC, with rice the primary crop under cultivation. The Lucich North and Frazer Habitat Preserves, maintained by The Natomas Basin Conservancy (TNBC), lie south of the NCC south levee from the eastern end of Reach 2 through the western end of Reach 6. A drainage canal, referred to as the Vestal Drain, runs parallel to the NCC south levee through much of Reach 2, approximately 100 feet from the landside levee toe. A private irrigation pump and irrigation canal are located at the landside levee toe in Reach 1. Natomas Central Mutual Water Company's (NMWC's) Bennett Pumping Plant and RD 1000's Pumping Plant No. 4 are located in Reach 2, and the NMWC Northern Pumping Plant is located in Reach 3. NMWC's North Main Canal runs parallel to the levee through Reaches 4 and 5, approximately 100 feet from the landside levee toe.

Sacramento River East Levee

An 18-mile-long section of the east levee of the Sacramento River protects the west side of the Natomas Basin between the NCC and the American River. For planning purposes, the levee is divided into 20 reaches. The Garden Highway is located on top of the levee crown within all 20 reaches. A drained, 10-foot-wide stability berm is present on the landside slope of the levee between the NCC and Powerline Road (Reaches 1–12). Cutoff walls were previously constructed through the levee in Reaches 12–20.

The land uses along the levee vary from north to south. Along the land side, Reaches 1–13 are bordered mainly by private agricultural lands containing a few rural residences, Airport bufferlands, and two farmed TNBC parcels. Teal Bend Golf Club is west of the Airport, adjacent to the levee along Reach 6. The parcels bordering Reaches 14–18 contain more residences, several rural estates, and three TNBC parcels. The land side of Reaches 19 and 20 is bordered by residential subdivisions, a business park, and City parklands.

Several irrigation canals, pipelines, wells, and pump stations exist along the Sacramento River east levee. The Elkhorn Canal and the Riverside Canal are key agricultural irrigation canals in the NMWC system. The Elkhorn Canal runs parallel to the Sacramento River east levee from the North Drainage Canal in Reach 4B through Reach 8 and into the start of Reach 9 (1,250 feet south of Elkhorn Boulevard). The Riverside Canal extends from just north of Reach 13 to the middle of Reach 19. Several lateral canals connect to the Elkhorn and Riverside Canals. These canals have earthen embankments with side slopes that are nearly vertical, requiring regular maintenance. Both canals are supplied by pumping plants on the Sacramento River.

In addition to the NMWC irrigation systems, there are several landowner-operated systems along the levee. These facilities are located primarily in Reaches 1–4A and 9–12, in areas not currently served by the NMWC systems. The areas are serviced by either well pumps on the land side or river pumps, which discharge into buried pipelines, small irrigation ditches, or directly onto fields. The distribution systems run along the landside toe of the levee to supply fields that slope away from the levee.

Several drainage pumping plants are operated by RD 1000 along the Sacramento River east levee. These facilities pump drain water from the main drainage canal system into the river. They include Pumping Plant No. 2, located in Reach 4B; Pumping Plant No. 5, located in Reach 10; Pumping Plant No. 3, located in Reach 13; and Pumping Plant No. 1, located in Reach 20A. Pumping Plant No. 2 was temporarily removed as part of an emergency levee repair in 2006 and would be replaced as an element of the project in 2009–2010. In addition to these RD 1000 pumping stations, the City of Sacramento operates the Willow Creek drainage pumping station which is located in Reach 19B.

Pleasant Grove Creek Canal West Levee

The PGCC west levee extends southerly from the east end of the NCC south levee to the north end of the NEMDC/Steelhead Creek levee near the Sankey Road crossing. The PGCC west levee protects the Natomas Basin from flood flows from Pleasant Grove Creek and other creeks in western Placer County, as well as from water that backs up in the NCC during high river stages in the Sacramento River. Natomas Road is located on top of the levee crown. No berms support this levee. A private canal extends parallel to the PGCC west levee for about 1,500 feet at the landside levee toe. Farms and scattered rural residences are located on the land side of the PGCC west levee, and a manufacturing facility and a railroad siding are located within several hundred feet of the levee, just south of Sankey Road.

Borrow Sites

Borrow sites are areas from which earthen materials would be removed for use in construction. The sites would be recontoured and developed as either managed marsh or grassland habitat following excavation for this use. Where borrow sites would be used over more than one construction season, the work would progress in cells that would be incrementally developed as habitat as the borrow activities are completed.

SAFCA has identified borrow sources for the project in 2008, 2009, and 2010 flood control and irrigation infrastructure improvements and redundant sources that may be pursued if negotiations regarding the preferred sources are unsuccessful or additional quantities are found to be needed during construction:

- Brookfield property (2008 preferred, 2009 preferred, 2010 preferred)
- Airport bufferlands north of the Airport complex (2008 preferred, 2009 preferred, 2010 potential)
- Fisherman's Lake area (2010 preferred) (no specific parcels identified for this borrow site)
- RD 1001 (2008 potential, 2009–2010 potential)

Except for the Fisherman's Lake area in the southern part of the Natomas Basin, these borrow areas are shown in Exhibit 3.

DESCRIPTION OF PROJECT ELEMENTS AND ACTIVITIES

The elements of the project are described in this section in four broad, overlapping categories:

- levee raising and seepage remediation,
- improvements to major irrigation and drainage infrastructure,
- habitat development and management, and
- additional actions to meet Federal Emergency Management Agency (FEMA) requirements: encroachment management and bridge crossing modifications.

Expanding the landside footprint of the Sacramento River east levee necessitates redesigning and relocating the irrigation and drainage infrastructure currently located along the landside toe of the levee. Relocation of other major and minor irrigation and drainage canals located near the NCC south levee and the PGCC west levee will be necessary with implementation of levee improvements. Modifications to the existing irrigation and drainage systems will include creation of a new canal designed to provide giant garter snake (GGS) habitat and improved stormwater drainage west of the Airport (GGS/Drainage Canal).

Site preparation would entail removing trees and other large vegetation from the construction area and stripping the top 6 inches of material from the landside slope of the existing levee, the footprint of the adjacent setback levee, the seepage berm areas, and the 50-foot-wide permanent maintenance access corridor. Large roots and

deleterious material) would then be grubbed from the working area. To the extent feasible, trees that must be removed from within the footprint of the adjacent setback levee or berms would be relocated outside of the footprint to new woodland planting areas, where a substantial number of new trees would also be planted. Excess earth materials (organic soils, roots, and grass from borrow areas and the adjacent levee foundation and excavated material that does not meet levee embankment criteria) would be used in the reclamation of borrow areas or hauled off-site to landfills. Cleared vegetation (i.e., trees, brush) would be hauled off-site to landfills. After construction, the levee slopes and any previously vegetated areas disturbed during construction, including staging areas, would be seeded with a grass mix.

The major project elements and related activities are summarized in Table 1.

Table 1
Summary of the Major Elements of the Project

Project Element	Project Activity and Timing
2008 Construction	
Levee raising and seepage remediation: NCC south levee	Raise and realign the NCC south levee to provide additional freeboard and more stable waterside and landside slopes and to reduce the need for removal of waterside vegetation. (May 8–November 1, 2008) Construct a seepage cutoff wall through the levee crown in Reaches 3–7. (May 8–October 15, 2008)
Levee raising and seepage remediation: Sacramento River east levee (adjacent setback levee)	Construct a raised adjacent setback levee from the NCC to just south of the North Drainage Canal (Reaches 1–4B, except Stations 55+00 to 68+00 in Reach 2) with a 100-foot seepage berm in Reach 4A and a 300-foot seepage berm in Reach 4B. (May 1–November 1, 2008)
Improvements to major irrigation and drainage infrastructure	Construct a new canal designed to provide drainage and associated giant garter snake habitat (the GGS/Drainage Canal) between the North Drainage Canal and Elkhorn Reservoir. (May 1–November 1, 2008) Relocate the Elkhorn Canal (highline irrigation canal) between the North Drainage Canal and Elkhorn Reservoir in anticipation of the filling of the existing Elkhorn Canal at the toe of the Sacramento River east levee in late 2008 and in 2009. (May 1–November 1, 2008) Remove a deep culvert at the location of Pumping Plant No. 2. (May 1–November 1, 2008)
Habitat creation and management	Establish vegetative habitat features in the new GGS/Drainage Canal. (Fall 2008) Recontour and create managed marsh and grassland on lands used as borrow sources. (Fall 2008 or spring 2009) Establish grassland on the adjacent setback levee slopes and seepage berms. (August 1–December 31, 2008) Install woodland plantings to offset the loss of portions of tree groves in the landside levee footprint. (Fall 2008)
Right-of-way acquisition	Acquire right-of-way through fee title or easement interest within the footprint of the project features, at the borrow sites and along the flood control system. (Before construction)
2009–2010 Construction	
Levee raising and seepage remediation: Sacramento River east levee (adjacent setback levee)	Construct an adjacent setback levee along Stations 55+00 to 68+00 in Reach 2 and from just south of the North Drainage Canal to the American River north levee (Reaches 5A–20B), raised where needed to provide adequate freeboard, with seepage berms, relief wells, and cutoff walls for seepage remediation as required (specific seepage remediation measures are still under study). (May 1–November 1, 2009, and May 1–November 1, 2010)
Seepage remediation: PGCC west	Flatten waterside and landside slopes, and construct seepage berms along the PGCC west levee (specific berm widths and potential use of cutoff walls in some areas to be

Table 1 Summary of the Major Elements of the Project	
Project Element	Project Activity and Timing
levee	determined). (May 1–November 1, 2010)
Improvements to major irrigation and drainage infrastructure	Construct the new GGS/Drainage Canal between Elkhorn Reservoir and the West Drainage Canal (specific alignment to be determined), and improve the West Drainage Canal to provide enhanced giant garter snake habitat. (May 1–November 1, 2009) Implement Airport West Ditch improvements in connection with construction of the GGS/Drainage Canal to allow the Airport to decommission the agricultural irrigation function of this facility and eliminate the hazards currently associated with it. The Airport stormwater detention function provided by this ditch would continue. The ditch would therefore be recontoured as a gently sloping swale to facilitate periodic maintenance such as mowing. (May 1–November 1, 2009) Relocate the Riverside Canal and the Elkhorn Canal downstream of Elkhorn Reservoir (specific alignments to be determined) and fill the existing canals. (May 1–November 1, 2009) Construct RD 1000 Pumping Plant No. 2. (April 1, 2009–September 1, 2010)
Habitat creation and management	Establish habitat enhancements in the new GGS/Drainage Canal and improved West Drainage Canal. (Fall 2009) Recontour and create marsh and managed grassland on lands used as borrow sources. (Fall or spring after borrow excavation in 2009 and 2010) Establish grassland on the adjacent setback levee slopes and seepage berms. (Fall after construction in 2009 and 2010) Install woodland plantings to offset the loss of portions of tree groves in the landside levee footprint (locations to be determined). (Fall 2009 and 2010)
Additional actions to meet FEMA requirements: encroachment management on the Sacramento River east levee, and bridge crossing modifications at the NCC	Remove encroachments from a portion of the water side and land side of the Sacramento River east levee as needed to ensure that the levee can be certified as meeting the minimum requirements of the NFIP and USACE design criteria (specific criteria still under discussion). (Timing to be determined) Modify the SR 99/70 crossing of the NCC as needed to meet FEMA requirements. (Timing to be determined)
Right-of-way acquisition	Acquire right-of-way through fee title or easement interest within the footprint of the project features, at the borrow sites and along the flood control system. (Before construction)
Notes: Airport = Sacramento International Airport; Elkhorn Canal = Elkhorn Main Irrigation Canal; FEMA = Federal Emergency Management Agency; GGS = Giant Garter Snake; NCC = Natomas Cross Canal; NFIP = National Flood Insurance Program; PGCC = Pleasant Grove Creek Canal; RD = Reclamation District; Riverside Canal = Riverside Main Irrigation Canal; SR = State Route; USACE = U.S. Army Corps of Engineers

ENCLOSURE 4

PROGRAMMATIC AGREEMENT
NATOMAS LEVEE IMPROVEMENT PROJECT

PROGRAMMATIC AGREEMENT
AMONG THE U.S. ARMY CORPS OF ENGINEERS, THE SACRAMENTO AREA FLOOD CONTROL AGENCY, AND THE CALIFORNIA STATE HISTORIC PRESERVATION OFFICER

REGARDING THE ISSUANCE OF PERMISSION UNDER THE AUTHORITY OF SECTION 408 OF THE RIVERS AND HARBORS ACT OF 1899 AND SECTION 404 OF THE CLEAN WATER ACT FOR THE NATOMAS LEVEE IMPROVEMENT PROGRAM, LANDSIDE IMPROVEMENTS PROJECT

WHEREAS, the U.S. Army Corps of Engineers, Sacramento District (Corps) proposes to review an application that seeks permission for alteration of flood control structures under the authority of Section 408 of the Rivers and Harbors Act and to issue one or more permits to discharge fill to the waters of the United States under the authority of Section 404 of the Clean Water Act to the Sacramento Area Flood Control Agency (SAFCA) for the Natomas Levee Improvement Program Landside Improvements Project (Project); and

WHEREAS, The Corps has determined that the issuance of these permissions and permits constitute an undertaking per 36 CFR 800.16(y), which require compliance with Section 106 of the National Historic Preservation Act (NHPA) of 1966 as amended (16 U.S.C. 470f); and

WHEREAS the Project includes improvements to an extensive levee system surrounding the Natomas Basin and landscape and irrigation/drainage infrastructure modifications that will be implemented in three construction phases, currently scheduled for 2008, 2009, and 2010; and

WHEREAS, the Corps has determined that this undertaking will have an adverse effect on at least one Historic Property that has been determined eligible for inclusion in the National Register of Historic Places (NRHP), CA-SAC-485/H; and

WHEREAS, because of the complex and phased nature of the improvements, the Corps has not yet determined the exact area of potential effects (APE), nor has SAFCA acquired all of the rights-of-entry, easements and ownership interests that would allow a complete inventory and determination of effects on Historic Properties; and

WHEREAS, the Natomas Basin is sensitive for buried archaeological resources that cannot be accurately located prior to construction; and such buried sites may also be Historic Properties, and therefore SAFCA and the Corps need to document a framework for managing post-review discoveries per 36 CFR Section 800.13, including evaluation of those resources, assessment of effects, and resolution of potential adverse effects; and

WHEREAS, at such time as any unevaluated cultural resource may be discovered, it may require archaeological data recovery and/or other historic preservation activities, in compliance with Section 106 of the National Historic Preservation Act, concurrent with *active* construction; and

WHEREAS, the urgency of flood control improvements require a management framework for Historic Properties that will be implemented after the execution of this agreement in an expedited manner that thus departs from the process normally used under 36 CFR Section 800 et seq., yet still fulfills the requirements of Section 106 of the NHPA; and

WHEREAS, SAFCA has been invited to participate as a signatory to this Programmatic Agreement (PA) by the Corps and the California State Historic Preservation Officer (SHPO; and

WHEREAS, the Corps has consulted The Ione Band of Miwok Indians, the Shingle Springs Band of Miwok Indians and the United Auburn Indian Community, and they have been invited to concur in this PA; and

WHEREAS, the Corps shall make the terms and conditions of this PA as part of the conditions of any permissions and permits issued by the Corps for this project; and

WHEREAS, The Central Valley Flood Protection Board has delegated all authority for SAFCA to comply with the terms of this agreement on its behalf; and

WHEREAS, the Corps has consulted with the SHPO and the Council in accordance with regulations implementing Section 106 of the NHPA;

WHEREAS, the Council has been consulted and declined to participate in this agreement;

NOW, THEREFORE, the Corps, the SHPO, and SAFCA agree that the Project shall be implemented in accordance with the following stipulations in order to take into account the effects of the undertaking on Historic Properties.

The Corps shall ensure that the following stipulations of this PA are carried out.

STIPULATIONS

I. DEFINITIONS

The terms used in this Programmatic Agreement shall be as defined in regulations implementing Section 106 of the NHPA, and as follows:

"APE (Area of Potential Effect)" means any location at which any Project development activity will be constructed; and locations of any Project-related construction staging areas, borrow areas, and materials stockpile areas; and the locations of any other Project development activities. The APE shall be defined so as to include the maximum spatial dimensions of all Project-related construction and operations rights-of-way, easements, areas which potentially may be affected by Project activities, and other properties to which SAFCA has access, whether on a temporary or permanent basis, or ownership for Project development.

"Concurring parties" means their concurrence indicates that they are in agreement with the terms of the PA.

"Consulting parties" means the Corps, the SHPO, and SAFCA who are signatories to this PA. Only signatories have the authority to amend or terminate this PA.

"Cultural resources" means any property or location that was created, modified, or used by people at least 50 years in the past. Cultural resources include but are not limited to Historic Properties and traditional cultural properties/places (i.e., NRHP listed or eligible properties as defined at 36 CFR Part 60).

"Historic Property" means a cultural resource that has been determined eligible for or is listed on the NRHP (i.e., NRHP listed or eligible properties as defined at 36 CFR Part 60), either by formal nomination and listing or by concurrence between federal agencies and the SHPO.

"Historic preservation" means any activity conducted in accordance with the NHPA and its implementing regulations to, among other things, inventory, evaluate, manage, or treat cultural resources such as buildings, structures, sites, districts, and objects eligible for, or that may be determined eligible for, listing in the NRHP according to eligibility criteria at 36 CFR Part 60.

"Project development activities" means any physical action related to the Project that has the potential to damage or otherwise alter those characteristics of Historic Properties that would make them eligible for listing in the NRHP.

II. STANDARDS

(A.) Professional Qualifications. All technical work required for historic preservation activities implemented pursuant to this Programmatic Agreement shall be carried out by or under the direct supervision of a person or persons meeting at a minimum the *Secretary of Interior's Professional Qualifications Standards* for archaeology or history, as appropriate (48 FR 44739). "Technical work" here means all efforts to inventory, evaluate, and perform subsequent treatment such as data recovery excavation or recordation that is required under this Programmatic Agreement. This stipulation shall not be construed to limit peer review, guidance, or editing of documents by SAFCA or SAFCA's consultants.

(B.) Historic Preservation Standards. Historic preservation activities carried out pursuant to this Programmatic Agreement shall meet the *Secretary of Interior's Standards and Guidelines for Archaeology and Historic Preservation* (48 FR 44716-44740) as well as standards and guidelines for historic preservation activities established by the SHPO. The Corps shall ensure that all reports prepared pursuant to this Programmatic Agreement will be provided to the consulting parties and shall ensure that all such reports meet published standards of the California Office of Historic Preservation, specifically, *Preservation Planning Bulletin* Number 4(a), "Archaeological Resources Management Reports (ARMR): Recommended Contents and Format" (December 1989).

III. PROJECT DESCRIPTION

(A) PROJECT Description. A description of the Project is found in the Final Environmental Impact Report (November 2007). A summary of the Project's description in the environmental impact report is provided as **Attachment A** and is made a part of this Programmatic Agreement.

(B) Existing Conditions. An archival search and archaeological survey have been completed for all areas of the APE as currently defined to which SAFCA currently has access, and which currently are not covered by paving, built environment features, or agricultural crops. A report of the results of archival research and archaeological survey, "Cultural Resources Inventory Reports, Part 1 – Natomas Levee Improvement Program Landside Improvements Project, Sacramento and Sutter Counties, California" (October 2007) is made **Attachment B** to this Programmatic Agreement.

A number of prehistoric sites are known to be present along the banks of the Sacramento River. However, archaeological survey of the area is of limited value because the alluvial depositional environment may

obscure and bury sites, leaving no surface manifestation of those archaeological resources. For most of the length of the Project, levees have been built on the riverbanks. These levees are one focus of the Project's activity, and occupy a substantial portion of the Project's APE. Furthermore, it has not been established whether certain known sites in proximity to the Project's development activities extend under the existing levees. The existing levees both obscure ground surfaces and prevent subsurface archaeological testing within their footprints. Because of these conditions, a full assessment of archaeological sites that may be present in the APE cannot be made in advance of construction. There is no definitive information, even for sites known to be in Project's proximity, of site boundaries relative to the APE, or of the significance or integrity of any portions of such sites that may be within the APE. For these reasons, even though archaeological deposits may extend into the APE, and even though some of these deposits may qualify as Historic Properties, it is impossible to develop meaningful site-specific Historic Properties Treatment Plans (HPTP) prior to all construction, or to carry out all necessary data recovery in advance of the Corps' approvals, permitting and construction.

For these reasons, unforeseen discoveries shall be treated pursuant to the provisions of 36 CFR 800.13 (Post-review discoveries).

(C) Project Phasing and Potential Changes to the APE: Because the improvements will occur in three phases (anticipated to be 2008, 2009, and 2010), it will be necessary to define the APE for each phase. The APE for each phase shall be submitted with the cultural resources inventory reports, and shall be consulted upon as part of that document, pursuant to **Stipulation** IV, below.

After the initial concurrence, changes to the APE may be necessary as SAFCA refines its phased Project plans. In particular, the ability of SAFCA to obtain access permissions of private landowners, determination of borrow sites and ongoing negotiations with resource agencies regarding species mitigation requirements may affect final Project's design, and may expand the current APE in some areas. Any changes to the APE shall be made in accordance with subsections D and E (below) of this Stipulation III. The SHPO, Corps, and SAFCA shall consult and reach concurrence in any changes to the APE. The final APE shall account for all Project development activities for the as-built Project. SAFCA shall notify the Corps of any change in the APE and the Corps shall determine the potential for Project development activities in a revised APE to affect cultural resources, through cultural resources inventory and testing as needed.

(1) If there is the potential that cultural resources exist in the revised APE, SAFCA shall submit to the Corps:
   (a) a map of the revised APE; and
   (b) a description of Project development activities to take place in the revised APE; and
   (c) a description of the inventory, nature, location, and known or potential significance of cultural resources in the revised APE; and
   (d) a description of any archaeologically sensitive areas in the revised APE that require monitoring by an archaeologist, and Native American monitor as appropriate; and
   (e) a plan for managing cultural resources in a manner that either avoids Project-related effects to cultural resources, or which mitigates any adverse effects, and which provides for the management of unforeseen cultural resources discoveries.

(2) If no cultural resources are identified within a revised APE, SAFCA shall document such a determination, provide documentation to the Corps and keep such documentation on file at its

principal offices.

After the Corps and SAFCA agree to a revised APE and if such a change has the potential to have an effect on cultural resources, the Corps shall submit the documentation to the SHPO for their review. The SHPO shall have 30 calendar days from the date of receipt of the notice of a revision to the APE to review and to provide in writing either concurrence with or objection to the definition of the revised APE, and any proposed historic preservation activities. Should the SHPO not respond in writing within 30 calendar days, the Corps and SAFCA shall proceed as though the SHPO has concurred in the revised APE, and the proposed historic preservation activities, if any.

Should the SHPO object to the definition of the revised APE or proposed historic preservation activities, the Corps, SAFCA, and the SHPO shall consult for a period not to exceed 15 calendar days following the date of the receipt of the SHPO's written objection in an effort to come to agreement on the issues to which the SHPO has objected. Should the SHPO, the Corps, and SAFCA be unable to agree on the issues to which the SHPO has objected, the consulting parties to this Programmatic Agreement shall proceed in accordance with **Stipulation VIII (Resolving Objections)**, below.

(D) Scope of Identification Efforts in the APE: Inventories of Historic Properties within the established or revised APE shall be completed in accordance with **Stipulation IV (Inventory of Historic Properties)** of this Programmatic Agreement. Treatment of any adverse effects to Historic Properties within the established or revised APE shall be completed in accordance with **Stipulation V (Treatment of Effects)** of this Programmatic Agreement.

(E) Scope of the APE: For purposes of this Programmatic Agreement, a revised APE shall be defined to meet, at a minimum, the following criteria:

(1) The APE for any segment of the Natomas levees that are being improved as part of the Project and shall include the levee segment and a corridor extending not less than 75 feet from the land side toe of the levee segment. The APE also shall include:

- The extent of all Project construction and excavation activity required to construct flood control facilities and to modify irrigation and drainage infrastructure,
- The additional right-of-way/easements obtained by SAFCA as part of the Project's features,
- All areas used for excavation of borrow material and habitat creation, and
- All construction staging areas.

(2) The APE for Project activities shall include the direct footprint of the activity and a reasonable buffer determined by consultation between SAFCA and the Corps, according to the nature of the activity, SAFCA's ownership interest or easement, and the probability that ground-disturbing work may extend beyond the footprint of planned improvements and activities.

(3) The APE for any other type of Project development activities shall be defined by the Corps in consultation with the consulting parties.

IV. INVENTORY OF HISTORIC PROPERTIES

(A) Identification Efforts to Date and Further Work Required: An inventory of Historic Properties

within the APE has been initiated consistent with the *Secretary of Interior's Standards and Guidelines for Archeology and Historic Preservation* (48 FR 44716–44740). The SAFCA shall submit a completed inventory and evaluation for each phase of Project work (2008, 2009, 2010) to the Corps. Such inventory shall be deemed complete by the Corps when the SHPO concurs in the NRHP eligibility recommendation for all cultural resources within the APE for that phase.

Areas of Archaeological Sensitivity: Areas of archaeological sensitivity will be monitored in accordance with HPTPs.

(C) Changes in the APE: If areas are added to the Project development activities subsequent to the SHPO concurrence on the map of the APE for a specific phase, SAFCA shall complete an inventory of Historic Properties within the expanded APE. Such inventory shall be undertaken and completed consistent with the *Secretary of Interior's Standards and Guidelines for Archeology and Historic Preservation* (48 FR 44716–44740). Such inventory shall be deemed completed by the Corps at such time as the SHPO concurs in the NRHP eligibility of all cultural resources within the established and revised APE for the Project, pursuant to this Stipulation IV.

V. TREATMENT OF EFFECTS

(A) Historic Property Treatment Plans: If Historic Properties are identified in cultural resources inventories that would be adversely affected by the Project, SAFCA shall prepare a Historic Properties Treatment Plan (HPTP) for review and written approval by the Corps and the SHPO for those specific properties. An HPTP applicable to every Historic Property that may sustain adverse effects by the Project shall be prepared, including for those Historic Properties found during construction. An HPTP may address individual or multiple Historic Properties. An HPTP shall stipulate those actions SAFCA shall take to resolve the adverse effects of the Project on Historic Properties. SAFCA shall ensure that all provisions of an HPTP are carried out in a timely manner. Any changes to an HPTP shall be reviewed and approved by the Corps. Copies of all reports pertaining to the treatment of Historic Properties shall be submitted to the consulting parties to this Programmatic Agreement. Reports and other data pertaining to the inventory of, and treatment of effects on, Historic Properties may be distributed to concurring parties to this Programmatic Agreement and to other members of the public consistent with **Stipulation VII (Confidentiality)** of this Programmatic Agreement. Individual HPTPs may be submitted simultaneously with the cultural resources inventory report for specific Project phases. If HPTPs are submitted simultaneously with an inventory report for a Project phase or with an addendum to such report for an expanded APE or Project description, the Corps and SHPO review period for such HPTP shall run concurrently with the review period for the inventory report.

Review Schedule: The SHPO and the Corps shall have 30 calendar days to review and comment upon in writing any HPTP submitted by SAFCA. The SHPO and the Corps shall indicate in their review that they find the HPTP either acceptable or not. In the event that comments are not made by the SHPO within 30 calendar days, the Corps shall assume the SHPO has accepted the HPTP as submitted. In the event the Corps and/or the SHPO provide written comment within the 30-day period, either SAFCA shall accept the comments and revise the HPTP accordingly, or SAFCA and the Corps may object to some or all comments. Comments from the Corps or the SHPO that are not acceptable to SAFCA shall be resolved by consultation among the Corps, the SHPO, and SAFCA for a period of not more than 15 calendar days. Should the Corps, the SHPO, and SAFCA be unable to resolve any dispute regarding the Corps or the SHPO comments, the consulting parties shall proceed in accordance with **Stipulation VIII (Resolving**

Objections) of this Programmatic Agreement.

The Corps shall submit to the SHPO for review and comment any amendment, addendum, revision or other change to an HPTP. SAFCA shall proceed to make changes to an HPTP as per the procedure and schedule for the review and approval of an original HPTP. If a Historic Property is discovered within an expanded APE subsequent to an initial inventory effort for a phase, and the Corps and SAFCA agree that the Project may adversely affect the property, SAFCA shall submit an addendum to the HPTP or a new HPTP. The review schedule for this submittal follows the provisions of Stipulation V.

(B) Commencement of Construction and Project Work: Project development activities may commence within the APE after a Historic Properties inventory has been completed (per **Stipulations III and IV**, above), and prior to treatment of adverse effects on Historic Properties within the APE provided that:

(1) A plan to respond to inadvertent archaeological discoveries is prepared by SAFCA and approved by the Corps prior to the commencement of Project activities anywhere in the APE for that phase of the Project; and

(2) Project development activities do not encroach within 30 meters (100 ft) of the known boundaries of any Historic Property as determined from archaeological site record forms, other documentation, or as otherwise defined in consultation with the SHPO; and

(3) An archaeological monitor is present during any Project activities that are anticipated to extend either vertically or horizontally into any areas designated to be archaeologically sensitive by SAFCA in consultation with the Corps.

(C) Final Report Documenting Implementation of the Historic Properties Treatment Plan(s): Within one year after the completion of all work performed as part of the Project SAFCA shall submit to the Corps and SHPO a final report documenting the results of all work prepared under the HPTPs. This report shall be submitted to the Corps and SHPO for review and comments, which SAFCA shall incorporate.

VI. NATIVE AMERICAN AND OTHER PUBLIC CONSULTATION AND PUBLIC NOTICE

Members of the interested public shall be invited to consult regarding this Programmatic Agreement. Within 30 calendar days of the signing date of this Programmatic Agreement, the Corps, the SHPO, and SAFCA shall consult to compile a list of members of the interested public who shall be provided notice of this Programmatic Agreement. The opinions of local Native Americans with cultural ties to the APE and the opinions of other members of the public shall be taken into account by the consulting parties for historic preservation actions taken in accordance with this Programmatic Agreement. Native Americans and other members of the public may be invited to concur in this Programmatic Agreement. Native American monitor(s) shall be invited to assist SAFCA in the treatment of any Native American human remains and items associated with Native American burials discovered during the Project in accordance with California Public Resources Code Section 5097.98 and California Health and Safety Code Section 7050.5(b) and 7050.5(c).

VII. CONFIDENTIALITY

Confidentiality regarding the nature and location of the archaeological sites and any other cultural

resources discussed in this Programmatic Agreement shall be maintained on a "need-to know" basis limited to appropriate personnel and agents of SAFCA, the Corps, and the SHPO involved in planning, reviewing and implementing this Programmatic Agreement consistent with Section 304 of the NHPA.

VIII. RESOLVING OBJECTIONS

(A.) Should any party to this Programmatic Agreement object to any action proposed or carried out pursuant to this Programmatic Agreement, the Corps shall consult with the objecting party(ies) for a period of time not to exceed *30 calendar days* to resolve the objection. If the Corps determines that the objection cannot be resolved, the Corps shall forward all documentation relevant to the dispute to the Council. Within 30 calendar days after receipt of all pertinent documentation, the Council shall either:

(1) Provide the Corps with recommendations, which the Corps shall take into account in reaching a final decision regarding the objection; or

(2) Notify the Corps that the Council will comment in accordance with the requirements of Section 106 of the NHPA, and proceed to comment. Any Council comment provided in response shall be taken into account by the Corps, pursuant to the requirements of Section 106 of the NHPA.

(3) Should the Council not exercise one of the above options within 30 days after receipt of all pertinent documentation, the Corps may assume the Council's concurrence in its proposed response to the objection.

(4) The Corps shall take into account any Council recommendation or comment provided in accordance with this stipulation with reference only to the subject of the objection; the Corps' responsibility to carry out all actions under this Programmatic Agreement that are not the subjects of the objection shall remain unchanged.

(B.) At any time during implementation of the measures stipulated in this Programmatic Agreement should an objection pertaining to the Programmatic Agreement be raised by a member of the public, the Corps or SAFCA shall notify the consulting parties to the Programmatic Agreement and take the objection into account, consulting with the objector and, should the objector so request, with any of the consulting parties to this Programmatic Agreement to address the objection.

IX. AMENDMENTS

Any consulting party to this Programmatic Agreement may propose that the Programmatic Agreement be amended, whereupon the Corps shall consult with the other consulting parties to this Programmatic Agreement to consider such amendment. Any amendment shall be executed by the consulting parties in the same manner as the original Programmatic Agreement.

If the Project has not been completed within five years of the date of the execution of this Programmatic Agreement, the consulting parties shall consult on a date not less than 90 days prior to the fifth anniversary of this Programmatic Agreement to either amend this Programmatic Agreement and acknowledge its continued applicability for the undertaking for a designated period of time, or terminate this Programmatic Agreement and proceed to again consult regarding the undertaking in accordance with regulations implementing Section 106 of the NHPA.

All attachments to this Programmatic Agreement, and other instruments prepared pursuant to this agreement such as, but not limited to, the Project's description, initial cultural resource inventory report and maps of the APE, HPTPs, and monitoring and discovery plans may be amended without requiring amendment of this Programmatic Agreement. Such amendments will be consulted on by the concurring parties and shall be final when agreement is reached by the parties.

X. FAILURE TO CARRY OUT THE TERMS OF THE AGREEMENT

Should the Corps fail to ensure that the terms of this Programmatic Agreement are carried out, the Corps shall notify the parties to this Programmatic Agreement and again consult with the SHPO and the Council in accordance with regulations implementing Section 106 of the NHPA. The Corps shall not take any action or make any irreversible decision that would affect an Historic Property, preclude historic preservation alternatives, or foreclose any opportunities for the Council to comment on the undertaking prior to completion of the process for considering and resolving effects on Historic Properties provided in this document.

XI. SCOPE OF THE PROGRAMMATIC AGREEMENT

Execution of this Programmatic Agreement by the Corps, the SHPO, and SAFCA, and implementation of its terms, evidence that Corps has afforded the Council an opportunity to comment on the undertaking for SAFCA Natomas Levee Improvement Program Landside Improvements Project, pursuant to 16 U.S.C. 470f, and that the Corps has taken into account the effects of the undertaking on Historic Properties. This Programmatic Agreement is limited in scope to the undertaking defined herein and is entered into solely for that purpose.

ATTACHMENT A

Project Description Summary

ATTACHMENT A

DESCRIPTION OF THE SACRAMENTO AREA FLOOD CONTROL AGENCY'S NATOMAS LEVEE IMPROVEMENT PROGRAM LANDSIDE IMPROVEMENTS PROJECT

PURPOSE AND NEED

PROJECT OVERVIEW

The Natomas Levee Improvement Program (NLIP) Landside Improvements Project proposed by the Sacramento Area Flood Control Agency (SAFCA) is intended to provide urgently needed flood control system improvements to the Natomas Basin in southern Sutter and northern Sacramento Counties, California (Exhibit 1). The project would improve the levee system that protects the 53,000-acre Natomas Basin, including a portion of the city of Sacramento. The Natomas Basin is bounded by leveed reaches of the Natomas Cross Canal (NCC) on the north, the Sacramento River on the west, the American River on the south, and the Pleasant Grove Creek Canal (PGCC) and Natomas East Main Drainage Canal (NEMDC)/Steelhead Creek on the east (Exhibit 1).

SAFCA's intent is to provide the Natomas Basin with at least a 100-year level of flood protection by the end of 2010 and a "200-year" level of protection by the end of 2012. Achievement of these aims would significantly reduce the risk of an uncontrolled flood in the Natomas Basin that would result in a catastrophic loss of property (estimated at $7 billion) and a prolonged interruption of commercial activity, including the operation of Sacramento International Airport (Airport) and closure of Interstate 5 (I-5) and State Route (SR) 99/70. Flooding is particularly hazardous in a heavily urbanized basin like Natomas because of the depths that floodwaters can reach—more than 10 feet in some areas.

DEFICIENCIES OF THE NATOMAS LEVEE SYSTEM AND PROPOSED REMEDIES

Approximately 26 miles of the NCC south levee, the Sacramento River east levee, and the PGCC west levee require one or more forms of remediation to address the potential for failure in a 100-year or "200-year" flood event, as follows:

- Inadequate freeboard—The NCC south levee and portions of the Sacramento River east levee must be raised to provide at least 3 feet of freeboard above the 100-year water surface elevation, and several reaches of the Sacramento River east levee must be raised to provide 3 feet of freeboard above the "200-year" design water surface elevation.

- Underseepage and through-seepage vulnerability—Most of these same reaches do not meet recently adopted federal criteria for safely containing underseepage and through-seepage when the water surface in the adjacent channel reaches the 100-year elevation or, in some cases, the "200-year" elevation.

Underseepage problems can occur where levees are constructed on low-permeability foundation soil (silt and clay) underlain by a layer of higher permeability (sand and gravel). Excessive underseepage makes the levee susceptible to failure during periods of high river stage. Under these conditions, seepage travels horizontally under the levee and then is forced vertically upward through the low-permeability foundation layer, often referred to as a "blanket." Failure of the blanket can occur either by uplift, a condition in which the blanket does not have enough weight to resist the confined pressure acting on the bottom of the blanket, or by piping (internal erosion) caused by water flowing under high vertical gradients through the erodible blanket and carrying fine soil particles out of the foundation materials. Through-seepage is seepage through a levee embankment that can occur during

periods of high river stage. Depending on the duration of high water and the permeability of embankment soil, seepage may exit the landside face of the levee. Seepage can also pass directly through pervious layers in the levee if such layers are present. Under these conditions, the stability of the landside levee slope may be reduced.

The project encompasses addressing freeboard deficiencies through levee raises; addressing seepage potential using a combination of seepage berms, cutoff walls, and relief wells; and acquiring additional right-of-way to construct the improvements and to prevent encroachment into the flood control system. In addition, the project has been designed to include an enlarged levee embankment (adjacent setback levee) along the land side of the existing Sacramento River east levee to preclude the need for substantial removal of vegetation and structural encroachments on the water side of this levee in compliance with U.S. Army Corps of Engineers (Corps) guidance. These improvements would include recontouring the levee slopes where necessary.

The following subsections summarize the methods to address freeboard deficiencies and seepage potential, which will be used in various combinations on the NCC south levee, Sacramento River east levee, and the PGCC west levee.

LEVEE RAISES

The freeboard increases would be accomplished through raises of the existing NCC south levee or through construction of the raised adjacent setback levee adjacent to the existing Sacramento River east levee:

- Raise of existing levee (NCC south levee). A full levee raise is required for the NCC south levee, consisting of an embankment raise from the landside or waterside toe (or both) upward to the increased levee crown elevation. This requires partially excavating the levee slope to provide a working platform for equipment, typically 10 feet wide, and rebuilding the levee to the appropriate elevation by benching the new embankment material into the existing embankment material.

- Adjacent setback levee (Sacramento River east levee). The levee raise of the Sacramento River east levee would be accomplished through the construction of an "adjacent setback levee" adjoining the Sacramento River east levee. The adjacent setback levee would be constructed with a crown elevation 3 feet above the "200-year" water surface profile. In the upper reaches, where the existing levee has freeboard deficiencies of as much as 3 feet, the crown of the adjacent setback levee would be higher than the existing levee and Garden Highway roadway. In the lower reaches, where the existing levee has sufficient freeboard, the adjacent setback levee would be the same height as the existing levee.

SEEPAGE BERMS

Seepage berms are wide embankments placed outward from the landside toe of the levee to lengthen the underseepage path, thereby lowering, to acceptable levels, the erosive potential of seepage passing through permeable layers under the levees. Seepage berms typically extend 100 to 400 feet from the levee. The berm thickness depends on the severity of the seepage pressure, but generally berms are 5 feet thick near the landside toe and taper to a thickness of 3 feet at the prescribed distance from the toe. A seepage collection ditch is often constructed at the landward toe of all seepage berms. Seepage berms are planned for construction along portions of the Sacramento River east levee and the PGCC west levee.

CUTOFF WALLS

Conventional slurry cutoff walls are typically constructed using an excavator with a long-stick boom capable of digging a trench to the maximum required depth. Bentonite slurry is pumped into the trench during trench excavation to prevent caving. The soil, cement, and bentonite are mixed to achieve the required cutoff wall strength and permeability, and the mixture is backfilled into the trench. Select fill is used to rebuild the levee. The NLIP includes construction of cutoff walls along portions of the NCC south levee and the Sacramento east levee. Cutoff wall construction may also be required in some areas along the PGCC west levee.

For the NCC south levee, preparation for construction of the cutoff wall would begin with using scrapers (or other suitable equipment, depending on the slope) to clear and grub/strip the surface to a depth of 2 inches to remove low-growing vegetation, loose stone, and surface soils. The aggregate base from the operating road also would be removed and stockpiled for later reuse. Waste material would be hauled to an off-site location.

Construction of the cutoff wall would include degrading the existing levee to a depth equal to one-half its total height (approximately 9 feet). A 70-foot-deep cutoff wall would be constructed for the total length of 23,150 lineal feet, with the method of installation at the contractor's discretion. Material degraded to support cutoff wall construction would be compacted at the landside toe of the levee to support raising portions of the NCC south levee. Unsuitable material generated from cutoff wall construction would be disposed of off-site. Equipment that would be used in phases of the cutoff wall construction includes excavators, scrapers, loaders, bulldozers, rollers, haul trucks, water trucks, hydroseeding trucks, pickup trucks, slurry pumps, and generators.

Work on the Sacramento River east levee includes construction of an adjacent levee with construction of a cutoff wall to occur in several reaches of the adjacent levee. Borrow material would be excavated from several locations in the project area and would be delivered to the levee construction sites by scrapers or haul trucks where it would be spread by motor graders and compacted by sheepsfoot rollers to build the adjacent levee up to a height equal to about two-thirds of the height of the existing levee. This would create a working platform for cutoff wall installation using an excavator with a long-stick boom capable of digging a trench to a maximum depth of approximately 80 feet. Bentonite slurry would be pumped into the trench during excavation to prevent caving. The soil excavated from the trench would be mixed with bentonite and backfilled into the trench to create the cutoff wall.

Relief Wells

Relief wells provide protection against levee underseepage by providing a path for underseepage to exit to the ground surface at the landside toe of the levee without creating sand boils or piping levee foundation materials. Relief wells are an option for addressing underseepage in reaches where continuous sand and gravel layers have been identified by the geotechnical analysis.

Relief wells are constructed near the levee landside toe to provide pressure relief beneath surficial fine-grained soils. The wells are constructed using soil boring equipment to bore a hole vertically through the fine-grained blanket layer and into the coarse-grained aquifer layer beneath. Pipe casings and filters are installed to allow the pressurized water to flow to the ground surface, thereby relieving the pressures beneath the clay blanket. Relief wells either may discharge onto open ground or may require conveyance to a stormwater drainage system or a pump station. Relief wells cause the least amount of construction disturbance but require routine maintenance of the wells themselves and the drainage and pumping facilities necessary to support them.

EXISTING PROJECT FACILITIES AND POTENTIAL BORROW SITES

All project construction activities would take place within the Natomas Basin, except for the development of a borrow site on Reclamation District (RD) 1001 land northeast of the basin (Exhibit 2). The following sections describe the existing flood control facilities, their general setting, and adjacent irrigation infrastructure and the potential borrow sources. These features, as well as the borrow locations, constitute the physical infrastructure and locations where the project may result in effects on historic properties.

Flood Control and Irrigation Facilities

Natomas Cross Canal South Levee

The NCC is a 5.3-mile-long channel that carries water from several tributary watersheds in western Placer County and eastern Sutter County to the Sacramento River. The NCC begins at the PGCC and East Side Canal and extends southwest to its confluence with the Sacramento River near the Sankey Road/Garden Highway

intersection. During periods of flooding, the Sutter Bypass, Sacramento River, and NCC all contribute to raised water elevations that can affect the NCC levees. For engineering purposes, the levee is divided into seven reaches. Much of the south levee contains an existing stability berm with an internal drainage system. An approximately 80- to 100-foot maintenance access area extends along the land side of the levee through most of the NCC's length.

Farms and rural residences are located on both sides of the NCC, with rice the primary crop under cultivation. The Lucich North and Frazer Habitat Preserves, maintained by The Natomas Basin Conservancy (TNBC), lie south of the NCC south levee from the eastern end of Reach 2 through the western end of Reach 6. A drainage canal, referred to as the Vestal Drain, runs parallel to the NCC south levee through much of Reach 2, approximately 100 feet from the landside levee toe. A private irrigation pump and irrigation canal are located at the landside levee toe in Reach 1. Natomas Central Mutual Water Company's (NMWC's) Bennett Pumping Plant and RD 1000's Pumping Plant No. 4 are located in Reach 2, and the NMWC Northern Pumping Plant is located in Reach 3. NMWC's North Main Canal runs parallel to the levee through Reaches 4 and 5, approximately 100 feet from the landside levee toe.

Sacramento River East Levee

An 18-mile-long section of the east levee of the Sacramento River protects the west side of the Natomas Basin between the NCC and the American River. For planning purposes, the levee is divided into 20 reaches. The Garden Highway is located on top of the levee crown within all 20 reaches. A drained, 10-foot-wide stability berm is present on the landside slope of the levee between the NCC and Powerline Road (Reaches 1–12). Cutoff walls were previously constructed through the levee in Reaches 12–20.

The land uses along the levee vary from north to south. Along the land side, Reaches 1–13 are bordered mainly by private agricultural lands containing a few rural residences, Airport bufferlands, and two farmed TNBC parcels. Teal Bend Golf Club is west of the Airport, adjacent to the levee along Reach 6. The parcels bordering Reaches 14–18 contain more residences, several rural estates, and three TNBC parcels. The land side of Reaches 19 and 20 is bordered by residential subdivisions, a business park, and City parklands.

Several irrigation canals, pipelines, wells, and pump stations exist along the Sacramento River east levee. The Elkhorn Canal and the Riverside Canal are key agricultural irrigation canals in the NMWC system. The Elkhorn Canal runs parallel to the Sacramento River east levee from the North Drainage Canal in Reach 4B through Reach 8 and into the start of Reach 9 (1,250 feet south of Elkhorn Boulevard). The Riverside Canal extends from just north of Reach 13 to the middle of Reach 19. Several lateral canals connect to the Elkhorn and Riverside Canals. These canals have earthen embankments with side slopes that are nearly vertical, requiring regular maintenance. Both canals are supplied by pumping plants on the Sacramento River.

In addition to the NMWC irrigation systems, there are several landowner-operated systems along the levee. These facilities are located primarily in Reaches 1–4A and 9–12, in areas not currently served by the NMWC systems. The areas are serviced by either well pumps on the land side or river pumps, which discharge into buried pipelines, small irrigation ditches, or directly onto fields. The distribution systems run along the landside toe of the levee to supply fields that slope away from the levee.

Several drainage pumping plants are operated by RD 1000 along the Sacramento River east levee. These facilities pump drain water from the main drainage canal system into the river. They include Pumping Plant No. 2, located in Reach 4B; Pumping Plant No. 5, located in Reach 10; Pumping Plant No. 3, located in Reach 13; and Pumping Plant No. 1, located in Reach 20A. Pumping Plant No. 2 was temporarily removed as part of an emergency levee repair in 2006 and would be replaced as an element of the project in 2009–2010. In addition to these RD 1000 pumping stations, the City of Sacramento operates the Willow Creek drainage pumping station which is located in Reach 19B.

Pleasant Grove Creek Canal West Levee

The PGCC west levee extends southerly from the east end of the NCC south levee to the north end of the NEMDC/Steelhead Creek levee near the Sankey Road crossing. The PGCC west levee protects the Natomas Basin from flood flows from Pleasant Grove Creek and other creeks in western Placer County, as well as from water that backs up in the NCC during high river stages in the Sacramento River. Natomas Road is located on top of the levee crown. No berms support this levee. A private canal extends parallel to the PGCC west levee for about 1,500 feet at the landside levee toe. Farms and scattered rural residences are located on the land side of the PGCC west levee, and a manufacturing facility and a railroad siding are located within several hundred feet of the levee, just south of Sankey Road.

Borrow Sites

Borrow sites are areas from which earthen materials would be removed for use in construction. The sites would be recontoured and developed as either managed marsh or grassland habitat following excavation for this use. Where borrow sites would be used over more than one construction season, the work would progress in cells that would be incrementally developed as habitat as the borrow activities are completed.

SAFCA has identified borrow sources for the project in 2008, 2009, and 2010 flood control and irrigation infrastructure improvements and redundant sources that may be pursued if negotiations regarding the preferred sources are unsuccessful or additional quantities are found to be needed during construction:

- Brookfield property (2008 preferred, 2009 preferred, 2010 preferred)
- Airport bufferlands north of the Airport complex (2008 preferred, 2009 preferred, 2010 potential)
- Fisherman's Lake area (2010 preferred) (no specific parcels identified for this borrow site)
- RD 1001 (2008 potential, 2009–2010 potential)

Except for the Fisherman's Lake area in the southern part of the Natomas Basin, these borrow areas are shown in Exhibit 3.

DESCRIPTION OF PROJECT ELEMENTS AND ACTIVITIES

The elements of the project are described in this section in four broad, overlapping categories:

- levee raising and seepage remediation,
- improvements to major irrigation and drainage infrastructure,
- habitat development and management, and
- additional actions to meet Federal Emergency Management Agency (FEMA) requirements: encroachment management and bridge crossing modifications.

Expanding the landside footprint of the Sacramento River east levee necessitates redesigning and relocating the irrigation and drainage infrastructure currently located along the landside toe of the levee. Relocation of other major and minor irrigation and drainage canals located near the NCC south levee and the PGCC west levee will be necessary with implementation of levee improvements. Modifications to the existing irrigation and drainage systems will include creation of a new canal designed to provide giant garter snake (GGS) habitat and improved stormwater drainage west of the Airport (GGS/Drainage Canal).

Site preparation would entail removing trees and other large vegetation from the construction area and stripping the top 6 inches of material from the landside slope of the existing levee, the footprint of the adjacent setback levee, the seepage berm areas, and the 50-foot-wide permanent maintenance access corridor. Large roots and

deleterious material would then be grubbed from the working area. To the extent feasible, trees that must be removed from within the footprint of the adjacent setback levee or berms would be relocated outside of the footprint to new woodland planting areas, where a substantial number of new trees would also be planted. Excess earth materials (organic soils, roots, and grass from borrow areas and the adjacent levee foundation and excavated material that does not meet levee embankment criteria) would be used in the reclamation of borrow areas or hauled off-site to landfills. Cleared vegetation (i.e., trees, brush) would be hauled off-site to landfills. After construction, the levee slopes and any previously vegetated areas disturbed during construction, including staging areas, would be seeded with a grass mix.

The major project elements and related activities are summarized in Table 1.

Table 1
Summary of the Major Elements of the Project

Project Element	Project Activity and Timing
2008 Construction	
Levee raising and seepage remediation: NCC south levee	Raise and realign the NCC south levee to provide additional freeboard and more stable waterside and landside slopes and to reduce the need for removal of waterside vegetation. (May 8–November 1, 2008) Construct a seepage cutoff wall through the levee crown in Reaches 3–7. (May 8–October 15, 2008)
Levee raising and seepage remediation: Sacramento River east levee (adjacent setback levee)	Construct a raised adjacent setback levee from the NCC to just south of the North Drainage Canal (Reaches 1–4B, except Stations 55+00 to 68+00 in Reach 2) with a 100-foot seepage berm in Reach 4A and a 300-foot seepage berm in Reach 4B. (May 1–November 1, 2008)
Improvements to major irrigation and drainage infrastructure	Construct a new canal designed to provide drainage and associated giant garter snake habitat (the GGS/Drainage Canal) between the North Drainage Canal and Elkhorn Reservoir. (May 1–November 1, 2008) Relocate the Elkhorn Canal (highline irrigation canal) between the North Drainage Canal and Elkhorn Reservoir in anticipation of the filling of the existing Elkhorn Canal at the toe of the Sacramento River east levee in late 2008 and in 2009. (May 1–November 1, 2008) Remove a deep culvert at the location of Pumping Plant No. 2. (May 1–November 1, 2008)
Habitat creation and management	Establish vegetative habitat features in the new GGS/Drainage Canal. (Fall 2008) Recontour and create managed marsh and grassland on lands used as borrow sources. (Fall 2008 or spring 2009) Establish grassland on the adjacent setback levee slopes and seepage berms. (August 1–December 31, 2008) Install woodland plantings to offset the loss of portions of tree groves in the landside levee footprint. (Fall 2008)
Right-of-way acquisition	Acquire right-of-way through fee title or easement interest within the footprint of the project features, at the borrow sites and along the flood control system. (Before construction)
2009–2010 Construction	
Levee raising and seepage remediation: Sacramento River east levee (adjacent setback levee)	Construct an adjacent setback levee along Stations 55+00 to 68+00 in Reach 2 and from just south of the North Drainage Canal to the American River north levee (Reaches 5A–20B), raised where needed to provide adequate freeboard, with seepage berms, relief wells, and cutoff walls for seepage remediation as required (specific seepage remediation measures are still under study). (May 1–November 1, 2009, and May 1–November 1, 2010)
Seepage remediation: PGCC west	Flatten waterside and landside slopes, and construct seepage berms along the PGCC west levee (specific berm widths and potential use of cutoff walls in some areas to be

Table 1 Summary of the Major Elements of the Project	
Project Element	**Project Activity and Timing**
levee	determined). (May 1–November 1, 2010)
Improvements to major irrigation and drainage infrastructure	Construct the new GGS/Drainage Canal between Elkhorn Reservoir and the West Drainage Canal (specific alignment to be determined), and improve the West Drainage Canal to provide enhanced giant garter snake habitat. (May 1–November 1, 2009) Implement Airport West Ditch improvements in connection with construction of the GGS/Drainage Canal to allow the Airport to decommission the agricultural irrigation function of this facility and eliminate the hazards currently associated with it. The Airport stormwater detention function provided by this ditch would continue. The ditch would therefore be recontoured as a gently sloping swale to facilitate periodic maintenance such as mowing. (May 1–November 1, 2009) Relocate the Riverside Canal and the Elkhorn Canal downstream of Elkhorn Reservoir (specific alignments to be determined) and fill the existing canals. (May 1–November 1, 2009) Construct RD 1000 Pumping Plant No. 2. (April 1, 2009–September 1, 2010)
Habitat creation and management	Establish habitat enhancements in the new GGS/Drainage Canal and improved West Drainage Canal. (Fall 2009) Recontour and create marsh and managed grassland on lands used as borrow sources. (Fall or spring after borrow excavation in 2009 and 2010) Establish grassland on the adjacent setback levee slopes and seepage berms. (Fall after construction in 2009 and 2010) Install woodland plantings to offset the loss of portions of tree groves in the landside levee footprint (locations to be determined). (Fall 2009 and 2010)
Additional actions to meet FEMA requirements: encroachment management on the Sacramento River east levee, and bridge crossing modifications at the NCC	Remove encroachments from a portion of the water side and land side of the Sacramento River east levee as needed to ensure that the levee can be certified as meeting the minimum requirements of the NFIP and USACE design criteria (specific criteria still under discussion). (Timing to be determined) Modify the SR 99/70 crossing of the NCC as needed to meet FEMA requirements. (Timing to be determined)
Right-of-way acquisition	Acquire right-of-way through fee title or easement interest within the footprint of the project features, at the borrow sites and along the flood control system. (Before construction)

INTRODUCTION

PURPOSE OF THIS REPORT

This report describes the work completed to date to identify cultural resources that have the potential to be affected by the Natomas Levee Improvement Program (NLIP) Landside Improvements Project, which is proposed for implementation by Sacramento Area Flood Control Agency (SAFCA). The proposed project consists of improvements to the levee system in the Natomas Basin and related landscape modifications and drainage and irrigation infrastructure improvements. This work will be completed in phases, starting in 2008 and continuing through 2010. As a local public agency in California, SAFCA must comply with the requirements of the California Environmental Quality Act (CEQA) regarding unique archaeological resources and historical resources as defined in Public Resources Code (PRC) Section 21083.2(g) and California Code of Regulations (CCR) Section 15064.5(a), respectively, and has prepared a draft environmental impact report that meets CEQA requirements. The project requires approvals from the U.S. Army Corps of Engineers (USACE), which must comply with the requirements of Section 106 of the National Historic Preservation Act (NHPA) for assessing impacts of projects on historic properties. Therefore, project implementation also must meet Section 106 requirements. This report provides preliminary information to support Section 106 compliance for the project.

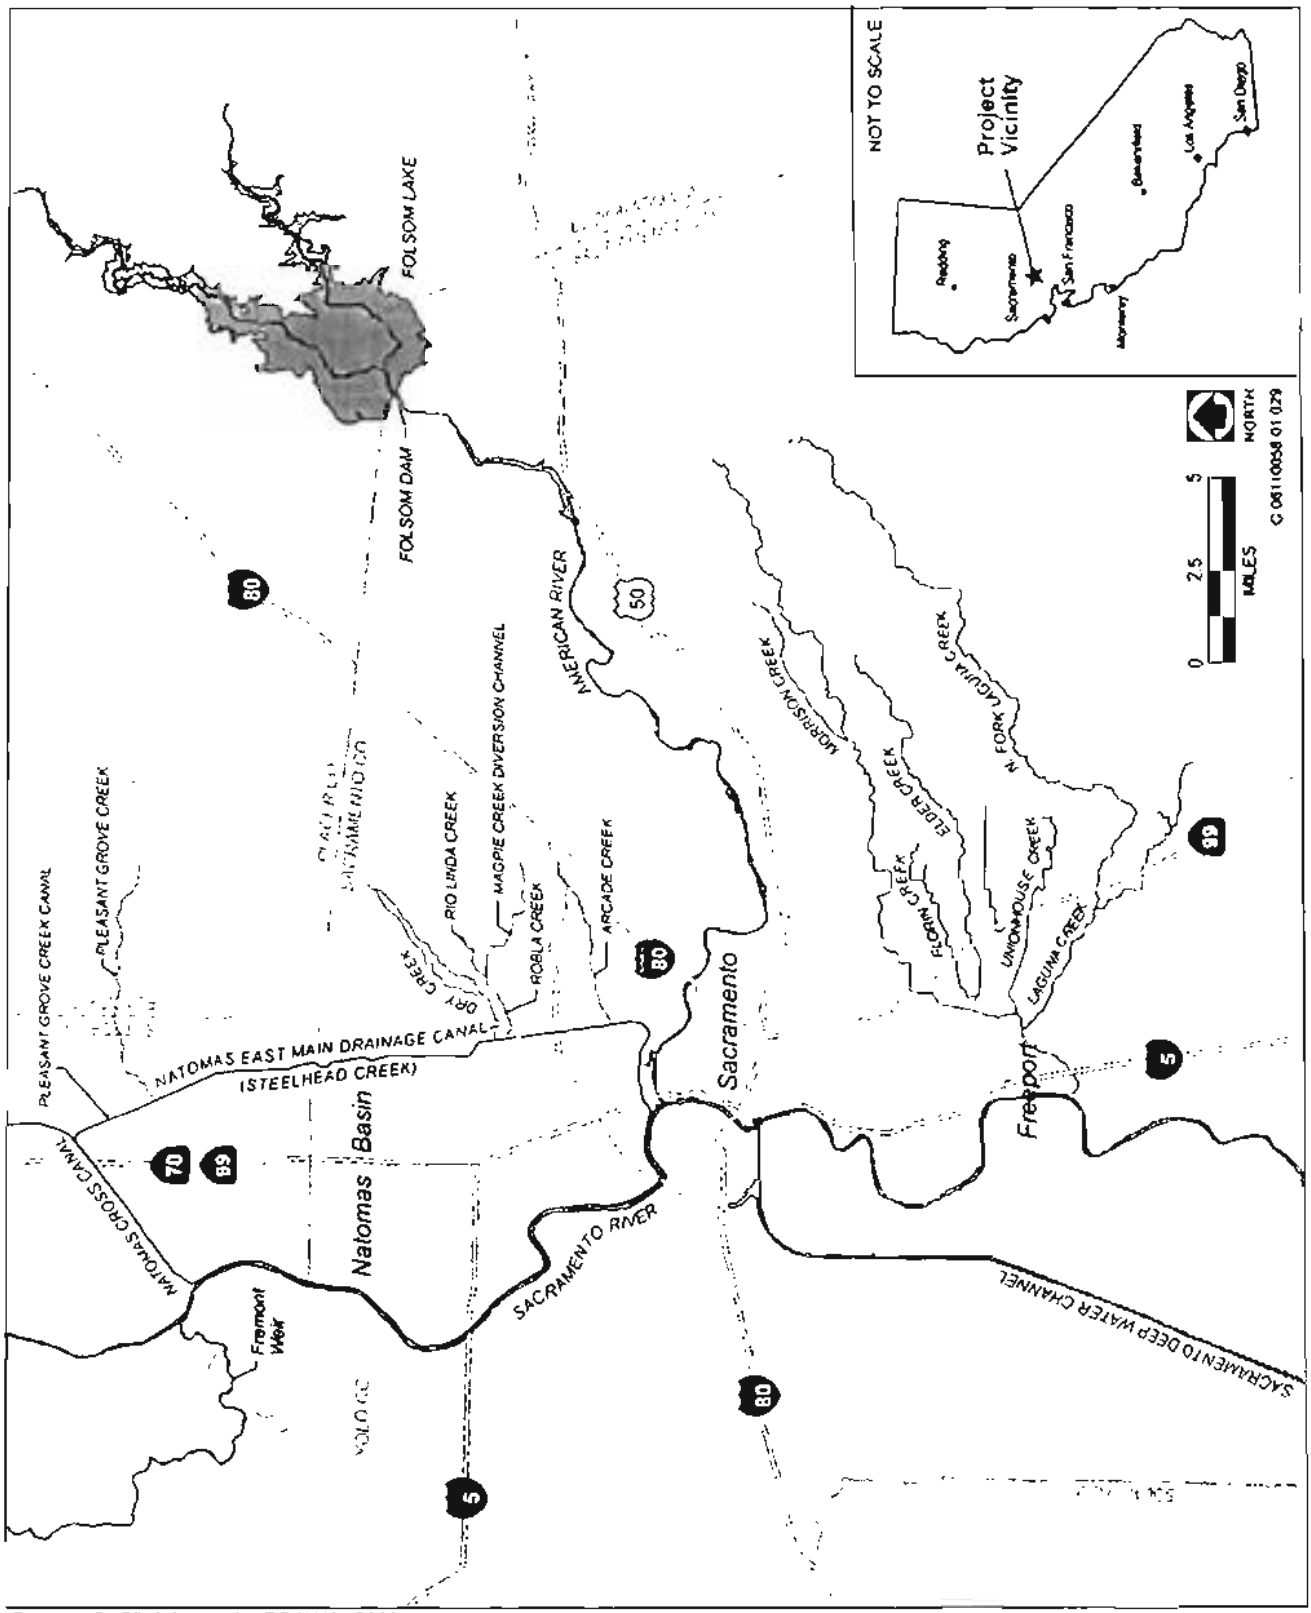
The report provides an overview of the proposed project; presents relevant setting information for the project area; and describes the following components of Section 106 compliance for the project:

- the regulatory context for cultural resources, including an existing programmatic agreement (PA) between USACE, the Bureau of Reclamation, the California State Office of Historic Preservation (SHPO), and the Advisory Council on Historic Preservation (ACHP) for projects that are a part of the federal American River Watershed Project. Additional signatories of the PA include the State of California Reclamation Board (The Reclamation Board) and SAFCA;
- the phased approach proposed for identification of cultural resources, pursuant to 36 Code of Federal Regulations (CFR) Section 800.4(b)(2);
- cultural resources identification efforts performed to date; and
- the scope of remaining identification and management efforts that will be undertaken.

PROJECT LOCATION AND GENERAL CHARACTERISTICS OF THE PROJECT AREA

The project area is located in Townships 9-11 North and Ranges 3-5 East, as depicted on the Sacramento East, Sacramento West, Gray's Bend, Taylor Monument, Verona, Pleasant Grove, and Rio Vista U.S. Geological Survey (USGS) 7.5'quadrangle maps. Elevations across the project area generally range from 20 feet to 40 feet (at the top of the levees) above mean sea level.

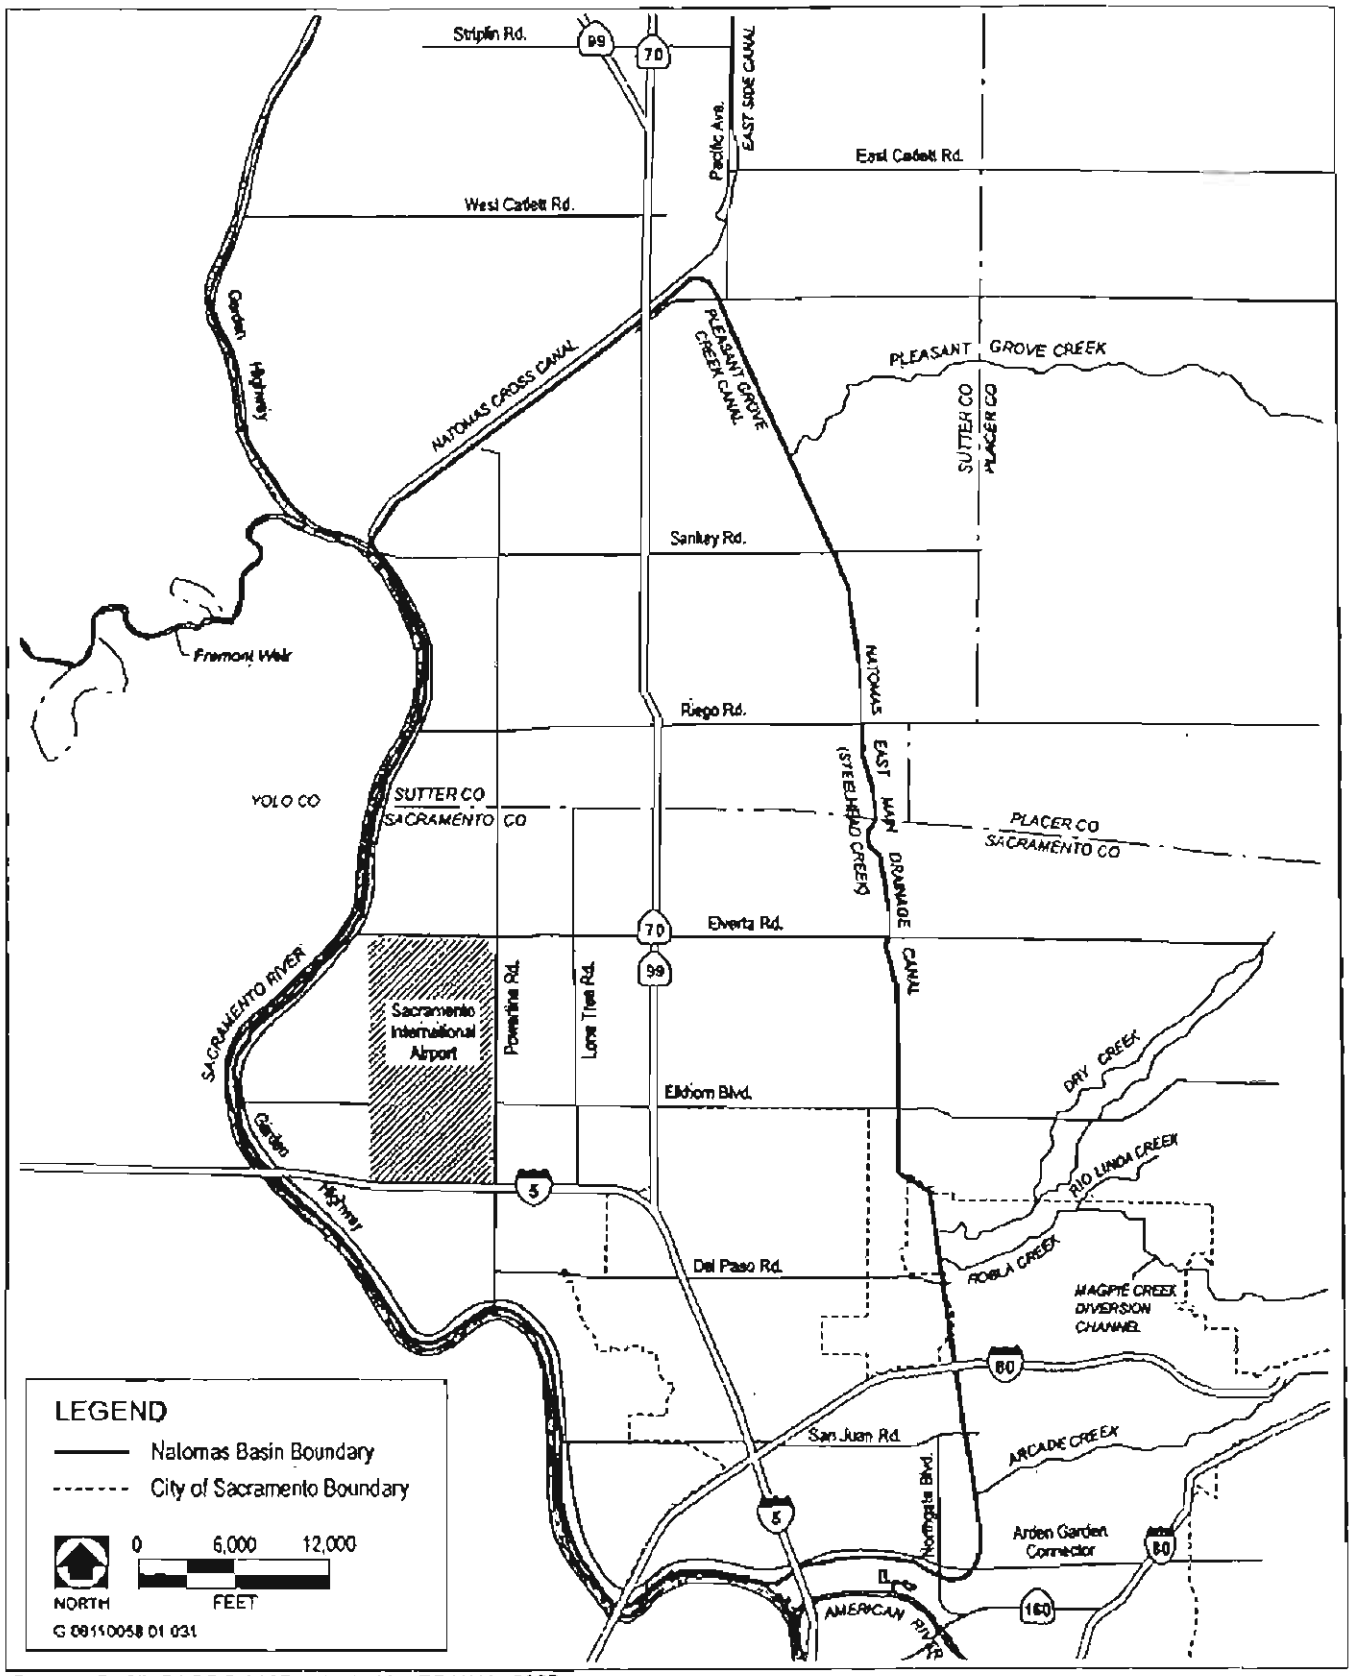
The project area is in the Natomas Basin in northern Sacramento and southern Sutter Counties, which is bounded by the Natomas Cross Canal (NCC) to the north, the Sacramento River to the west, the Sacramento and American rivers to the south, and the Pleasant Grove Creek Canal (PGGC) and the Natomas East Main Drainage Canal (NEMDC)/Steelhead Creek to the east. The regional and local settings of the Landside Improvements Project are shown in Exhibits 1 and 2, respectively. Most of the project activities would take place in the western portion of the Natomas Basin and along the NCC and PGCC.



Source: CaSil, Adapted by EDAW in 2007

Regional Setting

Exhibit 1



Source: CaSIl; SACOG 2007; Adapted by EDAW in 2007

Local Setting **Exhibit 2**

The project area is mainly used for agriculture, although the southern portion of the area is urbanized and lies within the City of Sacramento. The dominant landscape features of most of the area are elements of Reclamation District (RD) 1000, which are described below.

PROJECT DESCRIPTION

The Landside Improvements Project and the NLIP as a whole are part of the American River Common Features program of improvements to the flood control system protecting the Sacramento area that was initiated as part of the American River Watershed Investigation following the record flood of 1986. The NLIP Landside Improvement Project will address deficiencies in the peripheral levee system of the 53,000-acre Natomas Basin, specifically the NCC south levee, the Sacramento River east levee, and the PGCC west levee. Subsequent phases of the NLIP will address the NEMDC west levee and American River north levee following completion of additional geotechnical and hydraulic investigations.

The overall objectives of SAFCA's flood control improvement program, including the NLIP, are to:

(1) complete the projects necessary to provide 100-year flood protection for developed areas in Sacramento's major floodplains as quickly as possible,

(2) provide urban-standard ("200-year") flood protection for developed areas in Sacramento's major floodplains over time, and

(3) ensure that new development in the undeveloped areas of Sacramento's major floodplains does not substantially increase the expected damage of an uncontrolled flood.

The specific objectives of the proposed NLIP Landside Improvements Project are to:

(1) provide at least 100-year flood protection as quickly as possible while laying the groundwork to achieve at least "200-year" flood protection over time,

(2) use flood control projects in the vicinity of Sacramento International Airport (Airport) to facilitate changes in the management of Airport lands that reduce hazards to aviation safety, and

(3) use flood control projects to enhance habitat values by increasing the extent and connectivity of the lands in Natomas being managed to provide habitat for giant garter snake, Swainson's hawk, and other special-status species.

To meet these project objectives, SAFCA proposes the following project activities:

- 2008 construction

  - Along the 5.3-mile NCC south levee, raise the levee to provide additional freeboard; realign the levee to provide a more stable waterside slope and to reduce the need for removal of waterside vegetation, and construct a seepage cutoff wall in the eastern 4.3 miles (approximately) of the levee to reduce the risk of levee failure due to seepage and stability concerns.

  - Along the Sacramento River east levee, construct a raised adjacent setback levee from the NCC to 1,700 feet south of the North Drainage Canal with seepage berms, relief well, and cutoff walls where required to reduce seepage potential, and install woodland plantings.

  - Construct a new canal designed to provide drainage and associated giant garter snake habitat (referred to as the "GGS/Drainage Canal"), relocate the Elkhorn Canal between the North Drainage Canal and the

Elkhorn Reservoir settling basin ("Elkhorn Reservoir"), and remove a deep culvert from under the levee near the Pumping Plant No. 2 site.

- Recontour the land and create marsh and upland habitat at borrow locations.

- 2009 and 2010 construction

  - Along the Sacramento River east levee south of the limits of the 2008 improvements, construct an adjacent setback levee (raised where needed to provide adequate freeboard) with seepage berms, relief wells, and cutoff walls as required, and install woodland plantings.

  - Along the PGCC west levee, widen the levee, flatten the waterside and landside slopes, and construct seepage berms.

  - Construct a new GGS/Drainage Canal between Elkhorn Reservoir and the West Drainage Canal, improve the West Drainage Canal, relocate the Riverside Canal and the Elkhorn Canal downstream of Elkhorn Reservoir, and reconstruct the Reclamation District 1000 Pumping Plant No. 2.

  - Recontour the land and create marsh and upland habitat at borrow locations.

  - Remove encroachments from the water side of the Sacramento River east levee as needed to ensure that the levee can be certified as meeting the minimum requirements of the National Flood Insurance Program and USACE design criteria, and address Federal Emergency Management Agency requirements for the State Route (SR) 99/70 bridge crossing of the NCC.

Project construction would include a range of soil-disturbing activities in a region that is highly sensitive for cultural resources, particularly prehistoric archaeological sites. Levee improvements would require the excavation of inspection and cutoff wall trenches and extensive soil stripping and grading in the footprint of the adjacent setback levee along the existing Sacramento River east levee and where 100- to 300-foot-wide seepage berms would be constructed along the Sacramento River east levee and the PGCC west levee. Borrow material would be obtained through shallow excavation of several hundred acres of land in the Natomas Basin and excavation of a site northeast of the basin. The new GGS/Drainage Canal would be excavated for approximately 8 miles through the western part of the basin. Project implementation also would alter structures and landscapes associated with Reclamation District (RD) 1000, a resource eligible for listing on the National Register of Historic Places (NRHP).

The approximately 1 million cubic yards of borrow material for the NCC south levee and PGCC west levee improvements would be obtained from land owned by RD 1001 northeast of the Natomas Basin. Approximately 4.4 million cubic yards of soil material would be needed for construction of the levee embankment, berms, and relocated canals along the Sacramento River east levee. About 600,000 cubic yards would be obtained through excavation of the new GGS/Drainage Canal between RD 1000's existing North Drainage Canal north of the Airport and its existing West Drainage Canal southwest of the Airport. SAFCA would obtain the balance of the fill material it needs for the improvements along the Sacramento River east levee from parcels in the Airport bufferlands, land planned for habitat development by The Natomas Basin Conservancy, and nearby privately owned agricultural land (Exhibit 3).

Potential Borrow Areas **Exhibit 3**

BACKGROUND INFORMATION

REGULATORY SETTING

The project is subject to the provisions of CEQA, as well as Section 106 of the NHPA.

CALIFORNIA ENVIRONMENTAL QUALITY ACT

CEQA includes provisions that specifically address the protection of cultural resources. CEQA requires consideration of impacts of a project on unique archaeological resources and historical resources. A unique archaeological resource, as defined in PRC Section 21083.2(g), is an archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it:

(1) contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information;

(2) has a special and particular quality such as being the oldest of its type or the best available example of its type; or

(3) is directly associated with a scientifically recognized important prehistoric or historic event or person.

Section 15064.5(a) of the State CEQA Guidelines generally defines a historical resource as:

(1) a resource listed in, or determined to be eligible by the State Historical Resources Commission for listing in, the California Register of Historical Resources (CRHR);

(2) a resource included in a local register of historical resources or identified as significant in a historical resource survey; and

(3) any other object, building, structure, site, area, place, record, or manuscript that a lead agency determines to be historically significant, provided that the lead agency's determination is supported by substantial evidence.

CALIFORNIA REGISTER OF HISTORICAL RESOURCES

The CRHR includes resources that are listed in or formally determined eligible for listing in the NRHP (see below), as well as some California State Landmarks and Points of Historical Interest (PRC Section 5024.1, 14 CCR Section 4850). Properties of local significance that have been designated under a local preservation ordinance (local landmarks or landmark districts) or that have been identified in a local historical resources inventory may be eligible for listing in the CRHR and are presumed to be significant resources for purposes of CEQA unless a preponderance of evidence indicates otherwise (State CEQA Guidelines Section 15064.5[a][2]). The eligibility criteria for listing in the CRHR are similar to those for NRHP listing but focus on the importance of the resources to California history and heritage. A cultural resource may be eligible for listing in the CRHR if it:

(1) is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;

(2) is associated with the lives of persons important in our past;

(3) embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or

(4) has yielded, or may be likely to yield, information important in prehistory or history.

(See 14 CCR Section 4852.)

NATIVE AMERICAN HERITAGE COMMISSION

The Native American Heritage Commission (NAHC) identifies and catalogs places of special religious or social significance to Native Americans and known graves and cemeteries of Native Americans on private lands, and performs other duties regarding the preservation and accessibility of sacred sites and burials and the disposition of Native American human remains and burial items.

NATIONAL HISTORIC PRESERVATION ACT

Section 106 of the NHPA and its implementing regulations (36 CFR 800, as amended in 2004) require federal agencies to consider the potential effects of their proposed undertakings on historic properties. Historic properties are cultural resources that are listed on, or are eligible for listing on, the NRHP (36 CFR 800.16[l]). Undertakings include activities directly carried out, funded, or permitted by federal agencies. Federal agencies must also allow the Advisory Council on Historic Preservation (ACHP) to comment on the proposed undertaking and its potential effects on historic properties. Implementation of the proposed project would require permitting under Section 404 of the Clean Water Act and Section 408 approval from the USACE. Therefore, USACE compliance with Section 106 is required in relation to the proposed project.

SECTION 106 PROCESS

The implementing regulations for Section 106 of the NHPA require consultation with the State Historic Preservation Officer (SHPO), the ACHP, federally recognized Indian tribes and other Native Americans, and interested members of the public throughout the compliance process. The four principal steps are:

- Initiate the Section 106 process (36 CFR Section 800.3).
- Identify historic properties, resources eligible for inclusion in the NRHP (36 CFR Section 800.4).
- Assess the effects of the undertaking to on historic properties within the area of potential effect (APE) (36 CFR Section 800.5).
- Resolve adverse effects (36 CFR Section 800.6).

Adverse effects on historic properties are often resolved through preparation of a memorandum of agreement or PA developed in consultation between the federal agency, the SHPO, Indian tribes, and interested members of the public. The ACHP is also invited to participate. The agreement describes stipulations to mitigate adverse effects on historic properties.

NATIONAL REGISTER OF HISTORIC PLACES

The NRHP listing criteria are as follows (36 CFR Section 60.4):

The quality of significance in American history, architecture, archeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association and:

(a) that are associated with events that have made a significant contribution to the broad patterns of our history; or

(b) that are associated with the lives of persons significant in our past; or

(c) that embody the distinctive characteristics of a type, period or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

(d) that have yielded, or may be likely to yield, information important in prehistory or history.

Rural Historic Landscapes

The rural historic landscape is a category of resources that is evaluated under the Section 106 process. This resource category is relevant to this project because RD 1000, the local geographic setting of the proposed project, is eligible for NRHP listing as a Rural Historic Landscape District. National Register Bulletin 30 defines a rural historic landscape as a geographical area that historically has been used by people or shaped or modified by human activity, occupancy, or intervention and that possesses a significant concentration, linkage, or continuity of areas of land use, vegetation, buildings and structures, roads and waterways, and natural features. Rural landscapes commonly reflect the day-to-day occupational activities of people engaged in traditional work such as mining, fishing, and various types of agriculture. Often, they have developed and evolved in response to both the forces of nature and the pragmatic need of people to make a living. Landscapes that are small and that have no buildings or structures, such as an experimental orchard, are classified as sites. Most, however, being extensive in acreage and containing a number of buildings, sites, and structures—such as a ranch or farming community—are classified as historic districts. Large acreage and a proportionately small number of buildings and structures differentiate rural historic landscapes from other kinds of historic properties.

National Register Bulletin 30 distinguishes rural historic landscapes from designed landscapes. Rural landscapes usually are not the work of a professional designer and have not been developed according to academic or professional design standards, theories, or philosophies of landscape architecture. These properties possess tangible features, called landscape characteristics, that have resulted from historic human use. In this way, they also differ from natural areas that embody important cultural values but have experienced little modification, such as sites having religious meaning for Native American groups.

Existing Programmatic Agreement

USACE, the SHPO, the Bureau of Reclamation, and the ACHP in 1991 executed a PA that governs the Section 106 process for implementation of the American River Watershed Project, including constructing levee, channel, and related flood control improvements in the Natomas Basin. The PA covers implementation of the specific elements of the proposed improvements that would involve the USACE as the federal lead agency. Additional signatories of the PA include The Reclamation Board and SAFCA.

The PA is relevant to the present study because it controls the Section 106 process for work within the American River Watershed Project, a flood control program that coincides in part with the proposed project. Furthermore, it acknowledges the following: "the Project may be modified based on public input, congressional authorization, and ongoing negotiations among the primary sponsors." Portions of the proposed project that also coincide with the American River Watershed Project must satisfy the provisions of the PA.

The PA includes procedures for the treatment of indirect and direct impacts of the levee improvements associated with the American River Watershed Project. The executed PA specifies inventory and NRHP evaluation procedures for historic properties, as well as the process for development of Historic Property Treatment Plans (HPTPs). Additionally, the PA details report format and review, participation of interested parties, curation of

recovered materials, and professional qualifications. Mitigation measures may include archaeological documentation, architectural and engineering documentation, and historical documentation, following standards and guidelines promulgated by the Secretary of the Interior.

NATURAL SETTING

The geological information presented here is taken from SAFCA's Environmental Impact Report on Local Funding Mechanisms for Comprehensive Flood Control Improvements for the Sacramento Area (SAFCA 2007).

The project area lies in the Sacramento Valley portion of the Great Valley Geomorphic Province. The Great Valley is a large valley trending northwest-southeast that is bounded by the Sierra Nevada to the east and south, the Coast Ranges to the west, and the Klamath Mountains to the north. The Great Valley is drained by the Sacramento and San Joaquin Rivers, which join and flow out of the Great Valley province through San Francisco Bay. This geomorphic province is an asymmetric trough approximately 400 miles long and 50 miles wide that is characterized by a relatively flat alluvial plain made up of a deep sequence of sediment deposits from Jurassic to Recent age. The sediments in the Great Valley vary between 3 and 6 miles in thickness and were derived primarily from erosion of the Sierra Nevada to the east, with lesser material fro the Coast Ranges to the west. The eastern edge of the Sacramento Valley is flanked by uplifted and tilted sedimentary strata that overlie rocks of the Foothills Metamorphic Belt and are in turn overlain on the west by younger alluvium.

The Sacramento Valley has been a depositional basin throughout most of the late Mesozoic and Cenozoic time. A vast accumulation of sediments was deposited during cyclic transgressions and regressions of a shallow sea that once inundated the valley. Overlying the thick sequence of sedimentary rock units that form the deeply buried bedrock units in the mid-basin areas of the valley are Late Pleistocene and Holocene (Recent) alluvial deposits, consisting of reworked fan and stream materials that were deposited by streams prior to the construction of the existing flood control systems. The youngest geomorphic features in the area are low floodplains, which are found primarily along the Sacramento and American Rivers. The natural floodplains of these rivers are very wide in this area because the land is relatively flat. These major drainage ways were originally confined within broad natural levees sloping away from the rivers or streams. The natural levees formed through the deposition of alluvium during periods of flooding. As flood waters lost energy, the coarser materials settled out nearest the rivers and streams, forming the natural levees and sand bars in the vicinity of the river channel. The finer material was carried in suspension farther from the rivers or streams, and settled out in quiet water areas such as swales, abandoned meander channels, and lakes. However, because the streams have meandered and reworked the previously deposited sediments, extreme variations in material types may be found over a limited distance or depth.

Flanking the Recent alluvial deposits are late Pleistocene alluvial fan and terrace deposits of the Modesto and Riverbank Formations (Helley and Harwood 1985). Stream terrace deposits, mapped as the Modesto Formation, are higher in elevation and older than floodplain sediments. Before the construction of the existing levees, these stream terraces were occasionally flooded, but only small amounts of sediment were deposited during flood events. The lower fan terraces of the Riverbank Formation are higher in elevation and older than stream terraces, and were only rarely flooded.

The Natomas Basin is situated within the climatic band classified as the Lower Sonoran Zone. The climatic pattern is characterized as Mediterranean, with cool, wet winters and hot, dry summers. Locally, this pattern consists of approximately 17 inches of annual rainfall, high summer temperatures, and low humidity. The dominant vegetative communities in this area are prairie grasslands and tule marshes, with some areas of riparian woodland. Valley oak (*Quercus lobata*), cottonwood (*Populus fremontii*), sycamore (*Platanus racemosa*), and willow trees (*Salix* spp.) once grew on the verge of streams and rivers. Tule marshes included stands of tules, cattails, sedges, rushes, and clumps of willow trees.

Faunal species that frequented the prehistoric prairie grasslands and tule marshes included mule deer (*Odocoileus hemionus*), tule elk (*Cervus elaphus*), antelope (*Antilocapra americana*), weasel (*Mustela frenata*), river otter (*Lutra canadensis*), raccoon (*Procyon lotor*), and beaver (*Castor canadensis*). Migratory waterfowl, such as geese (*Branta canadensis*) and swans (*Olor* sp.), passed through during winter, joining resident white pelicans (*Pelecanus erythrorhynchus*), great blue and black-crowned herons (*Ardea herodias*, *Nycticorax nycticorax*), ibis (*Plegadis guarauna*), cranes (*Grus canadensis*), cormorants (*Phalacrocorax* sp.), and eagles (*Haliaetus leucocephalus*). Badgers (*Taxidea taxus*), coyotes (*Canis latrans*), skunks (*Mephitis mephitis*), jackrabbits (*Lepus californicus*), and cottontail rabbits (*Sylvilagus audubonii*) inhabited higher ground.

Within the waterways, chinook salmon (*Oncorhynchus tshawytscha*), rainbow trout (*Salmo gairdneri*), Pacific lamprey (*Lampetra tridentate*), and white sturgeon (*Acipenser transmontanus*) seasonally joined the other fish species indigenous to the area. Predators such as mountain lions (*Felis concolor*), grizzly bears (*Ursus americanus*), wolves (*Canis lupus*), kit fox (*Vulpes macrotis*), and bobcats (*Lynx rufus*) also roamed the area (Moratto 1984).

PREHISTORIC SETTING

PALEO-INDIAN AND LOWER ARCHAIC PERIODS

The earliest well-documented entry and spread of humans into California occurred at the beginning of the Paleo-Indian Period (10,000–6000 B.C.). Social units are thought to have been small and highly mobile. Known occupation sites have been identified within the contexts of ancient pluvial lake shores and coastlines, where characteristic hunting implements, such as fluted projectile points and chipped stone crescent forms, have been found. Prehistoric adaptations over the ensuing centuries have been identified in the archaeological record by numerous researchers working in the area since the early 1900s, as summarized by Fredrickson (1974) and Moratto (1984). Because of its plentiful resources and temperate climate, the Central Valley was well populated prehistorically and served as the location for some of the more substantial village sites known in California.

Beardsley (1948), Heizer and Fenenga (1939), and others conducted numerous studies that form the core of our early understanding of upper Central Valley archaeology. Little has been found archaeologically that dates to the Paleo-Indian or Lower Archaic (6000–3000 B.C.) time periods. However, archaeologists have recovered much data from sites occupied by the Middle Archaic period. The lack of discovery of sites from earlier periods may be the result of high sedimentation rates that have left the earliest sites deeply buried and inaccessible.

MIDDLE ARCHAIC, UPPER ARCHAIC, AND EMERGENT PERIODS

During the Middle Archaic Period (3000–1000 B.C.), the broad regional patterns of foraging subsistence strategies gave way to more intensive procurement practices. Subsistence economies were more diversified, possibly including the introduction of acorn processing technology. Human populations were growing and occupying more diverse settings. Permanent villages occupied year-round were established, primarily along major waterways. The onset of status distinctions and other indicators of growing sociopolitical complexity mark the Upper Archaic Period (1000 B.C.–A.D. 500). Exchange systems become more complex and formalized. Evidence of regular, sustained trade between groups was seen for the first time.

Several technological and social changes characterized the Emergent Period (A.D. 500–1800). The bow and arrow were introduced, ultimately replacing the dart and atlatl. Territorial boundaries between groups became well established. It became increasingly common that distinctions in an individual's social status could be linked to acquired wealth. Exchange of goods between groups became more regularized with more goods, including raw materials, entering into the exchange networks. In the latter portion of this period (A.D. 1500–1800), exchange relations became highly regularized and sophisticated. The clamshell disk bead became a monetary unit for exchange, and increasing quantities of goods moved greater distances. Specialists arose to govern various aspects of production and exchange.

The Middle and Upper Archaic and Emergent Periods are further broken down under the Central California Taxonomic System. These three time periods are well represented in archaeological assemblages in the vicinity of the project area. The assemblages are discussed in detail in Bennyhoff and Fredrickson (1969) and Moratto (1984) and are summarized here.

The **Windmiller Pattern** (3000–500 B.C.) of archaeological assemblages included an increased emphasis on acorn use and a continuation of hunting and fishing activities. Ground and polished charmstones, twined basketry, baked-clay artifacts (frequently used as a substitute for stone in the Central Valley), and worked shell and bone were hallmarks of Windmiller culture. Widely ranging trade patterns brought goods in from the Coast Range and trans-Sierran sources as well as closer trading partners. Perforated charmstones were associated with some burials. Mano and metate and small mortars were used but were rare.

Distinctive burial practices (ventrally extended, oriented westward) identified with the Windmiller Pattern also appeared in the Sierra Nevada foothills, indicating possible seasonal migration into the Sierra Nevada. The specific orientation of burials reinforces the idea that summers were spent in the Sierra Nevada and winters in the Central Valley. Men were generally buried in separate areas, in deeper graves, and with more artifacts than women, possibly indicating a higher social status. However, the rich offerings found with some women and children suggest that wealth also followed lineages or some sort of social patterns as well.

The **Berkeley Pattern** (200 B.C.–A.D. 700) represented a greater reliance on acorns as a food source than was seen previously. Distinctive stone and shell artifacts distinguished it from earlier or later cultural expressions, and may indicate the arrival and spread of ancestral Plains Miwok from the Bay Area region. Burials were predominantly placed in a tightly flexed position and frequently included red ochre. Minimally shaped mortar and pestle technology was much more prevalent than mano/metate. Nonstemmed projectile points become more common.

The **Augustine Pattern (A.D. 700–1800)** was marked by increasing populations resulting from more intensive food procurement strategies, and also by a marked change in burial practices and increased trade activities. Intensive fishing, hunting and gathering, complex exchange systems, and a wider variety in mortuary patterns were all hallmarks of this period. Mortars and pestles were more carefully shaped, and bow-and-arrow technology was present. Fishing implements became more common, trade increased, and cremation was used for some higher-status individuals. A well-developed ceramic industry has been noted at a site near Sloughhouse, east of Sacramento.

ETHNOGRAPHIC SETTING

The project area is situated within the lands traditionally occupied by the Nisenan, or Southern Maidu. The language of the Nisenan, which includes several dialects, is classified within the Maiduan family of the Penutian linguistic stock (Kroeber 1925). The western boundary of Nisenan territory was the western bank of the Sacramento River and the area between present-day Sacramento and Marysville. In the Sacramento Valley, the triblet, consisting of a primary village and a few satellite villages, served as the basic political unit (Moratto 1984). Valley Nisenan territory was divided into three triblet areas, each populated with several large villages (Wilson and Towne 1978), generally located on low, natural rises along streams and rivers or on slopes with a southern exposure. One important village, *Pusune*, near Discovery Park, appears to have been recorded as CA-SAC-26. Other villages—*Wollok, Leuchi, Wishuna, Totola,* and *Nawrean*—were located east of the confluence of the Feather and Sacramento Rivers, near the northwestern portion of the Natomas Basin.

Nisenan houses were domed structures covered with earth and tule or grass and measured 10–15 feet in diameter. Brush shelters were used in the summer and at temporary camps during food-gathering rounds. Larger villages often had semisubterranean dance houses that were covered in earth and tule or brush and had a central smoke hole at the top and an east-facing entrance, as well as smaller sweathouses. Another common village structure was a granary, which was used for storing acorns (Wilson and Towne 1978). Valley Nisenan people followed a

seasonal round of food gathering, as did most California Indians. The wide variety of food resources available was exploited year round, but hunting and gathering activities were at their most intense in late summer and early fall. Food staples included acorns, buckeyes, pine nuts, hazelnuts, various roots, seeds, mushrooms, greens, berries, and herbs. Game, roasted, baked, or dried, included mule deer, elk, antelope, black bear, beaver, squirrels, rabbits, fish, shellfish, and other small animals and insects (Wilson and Towne 1978). Seasonal harvests were carried out by families or the larger community, engendering social behavior such as sharing, trading, and conducting ceremonies.

Euro-American contact with the Nisenan began with infrequent excursions by Spanish explorers and Hudson Bay Company trappers traveling through the Sacramento and San Joaquin Valleys in the early 1800s. In general, Nisenan lifeways remained stable for centuries until the early to middle decades of the 19th century. With the coming of Russian trappers and Spanish missionaries, cultural patterns began to be disrupted as social structures were stressed. An estimated 75% of the Valley Nisenan population died in the malaria epidemic of 1833. With the influx of Europeans during the Gold Rush era, the population was further reduced as a result of disease and violent relations with the miners. However, today the Maidu are reinvesting in their traditional culture and, through newfound political, economic, and social influence, now constitute a growing and thriving native community in California.

HISTORIC SETTING

EARLY EXPLORATION

Although Russian trappers and traders associated with the Hudson's Bay Company likely traveled through Sacramento, Sutter, and Yuba Counties during earlier years, the first well-documented European exploration of the general region occurred in 1808, when Spanish explorer Gabriel Moraga led an expedition from Mission San Jose to the northern Sacramento Valley (Hoover, Rensch, and Rensch 1966). The earliest Euro-American settlement coincided with the establishment of land grants by the Mexican government in the 1840s. John A. Sutter obtained the first such grant in the region in 1841. Sutter's New Helvetia Rancho encompassed lands on the east bank of the Feather and Sacramento Rivers within the project area (Beck and Haase 1974).

MINING

Although there are no records of large-scale mining having been conducted in the project area or in the immediate vicinity, the industry had considerable indirect effects on historical developments in the region. The diggings and mines in the Sierra Nevada foothills dramatically increased economic activity in the region, leading to increased prosperity and the rise of larger and more numerous support industries, such as cattle ranches and farms. In addition, sediments washing into the Central Valley watercourses, including the Feather, Sacramento, and American Rivers, had a negative impact on water quality and on the scale and frequency of seasonal flooding.

Hydraulic mining, first conducted in Nevada in 1852, was the most cost-effective means of recovering placer gold from deeply buried gravels along and near river and stream channels. To access these deeply buried deposits, miners used streams of water under high pressure to wash away sediments and gravels. The sands and gravels were passed through sluices that separated out the placer gold. Silt and sand washed into nearby creeks, streams, and rivers, raising watercourse beds, clogging the channels, and generally polluting the waters. Between 1849 and 1909, 195 million cubic meters of mining debris entered the channels of the American River basin. The deposition of silt in the rivers resulted in the raising of the riverbeds and increased flooding. After 1861, catastrophic floods became more common, prompting the development of a levee system and beginning the process of land reclamation for agricultural purposes.

Construction of a railroad was a natural outgrowth of Sacramento's expansion and the need to deliver supplies to the California foothills. The railroad was completed by February 1856. The first rail line ran to the town of Folsom, where at least 21 different wagon trains then carted goods from the train to outlying areas as far away as Carson City, Nevada. The Central Pacific Railroad bought the Sacramento Valley Railroad in 1865 and added its

facilities to those already being built for the Transcontinental Railroad. The Central Pacific and its successor, the Southern Pacific Railroad, became the major industry in Sacramento after 1863. It is estimated that early in its history, the railroad employed 20–30% of salaried employees in Sacramento (Historic Environment Consultants 1998).

Agriculture and Flood Control

General

Agriculture and ranching were the primary industries in the present-day Sacramento and Sutter County region during the historic period. Regional ranching originated on the New Helvetia rancho in the early 1840s. The Gold Rush precipitated growth in agriculture and ranching, as ranchers and farmers realized handsome returns from supplying food and other goods to miners. Frequent floods plagued the residents of the region, however, and posed a significant threat to the viability of agricultural interests and further settlement.

Initial efforts at flood control were usually uncoordinated and consisted of small levees and drains constructed by individual landowners. These features proved insufficient to protect cultivated land, and much of the project area flooded regularly (Dames & Moore 1994a). In 1861, the California Legislature created the State Board of Swampland Commissioners to reclaim swamp and overflow lands. The State Board of Swampland Commissioners established 32 districts that attempted to enclose large areas with natural levees. Lack of cooperation among the landowners in the districts led to chronic financial crises. When the legislature terminated the State Board of Swampland Commissioners in 1866, responsibility for swamp and overflow land fell to the individual counties. Many counties offered incentives to landowners for reclaiming agriculturally unproductive land. If a landowner could certify that he had spent at least $2 per acre in reclamation, the county would refund the purchase price of the property to the owner. Speculators took advantage of this program and a period of opportunistic and often-irrational levee building followed (Thompson 1958).

In the early part of the 20th century, the state legislature established The Reclamation Board to exercise jurisdiction over reclamation districts and levee plans. That year, the state approved and began implementation of the Sacramento River Flood Control Project (SRFCP). The ambitious project included the construction of levees, weirs, and bypasses along the river to channel floodwaters away from population centers. Under the SRFCP, new reclamation districts were created, including RD 1000, consisting of approximately 55,000 acres in the Natomas Basin. RD 1000 was largely controlled by the Natomas Company, which had access to more money than any individual landowner. The Natomas Company was formed in 1851 in Sacramento County to supply water for placer mining and irrigation. It later became involved in dredging for gold and expanded its water supply business. The Natomas Company became involved in land reclamation in part as a rebuttal of criticism that farmland was being destroyed by the company's gold dredging activities (Dames & Moore 1994a).

RD 1000 Rural Historic Landscape District

The infrastructure of RD 1000 (Exhibit 4) was completed in the 1920s. It includes levees, drainage canals, pumps, irrigation systems, agricultural fields, and roads, as well as remnant natural features. The originally constructed features included levees and exterior drainage canals, an interior drainage canal system, nine pumping plants, a series of levee and interior roads, and unpaved rights-of-way between the farm fields.

Previous efforts to document and mitigate impacts on elements of RD 1000 are relevant to the proposed project. The RD 1000 area has been identified as eligible for inclusion in the NRHP as a Rural Historic Landscape District. The evaluation process was conducted both to determine the NRHP eligibility of the district and to evaluate whether the district would be significantly affected by flood control projects planned and subsequently implemented by the USACE as part of the American River Watershed Project (Dames & Moore 1994a). The "determination of effects" statement concluded that the USACE projects would adversely affect both contributing

and noncontributing elements of the Rural Historic Landscape District by allowing for greater development to occur in the region. Mitigation measures were recommended and adopted. These consisted of Historic American Engineering Record documentation, which was prepared by Peak & Associates (1997); videotapes of historic properties; and a list of repositories where copies of the information would be made available to the public.

Dames & Moore determined that RD 1000 appears to be eligible for listing as a Rural Historic Landscape District at the state level of significance for the period from 1911 to 1939 under Criterion A. The area of significance was listed as reclamation and the historical context was listed as the flood control and reclamation of the Sacramento River basin within the SRFCP as an important part of the history of reclamation and flood control. The district retains much of its historic integrity, including location design, setting, materials, workmanship, feeling, and association. The contributing and noncontributing elements of the district were defined as part of this effort. Contributing elements were described as follows:

- **Drainage System:** East Levee, River Levee, Cross Canal Levee; Natomas East Main Drainage Canal; Cross Canal; Pleasant Grove Canal; Pumping Plants No. 1-A, 2, and 3; the canal connecting Pumping Plant No. 3 and the West Drainage Canal, North Drainage Canal, East Drainage Canal, West Drainage Canal, Natomas Main Drainage Canal, and the drainage ditches within the areas of contributing large-scale land patterns.

- **Road System:** Garden Highway from Orchard Lane north to the Cross Canal; East Levee/Natomas Road; Sankey Road; Riego Road; Elverta Road; Elkhorn Boulevard from Garden Highway to the western boundary of the Sacramento Airport; Del Paso Road from Powerline Road to its intersection with Interstate 5 (I-5); San Juan Road from Garden Highway to its intersection with I-5; Powerline Road; El Centro Road from north of Interstate 80 (I-80) to its intersection with Bayou Way; and the right-of-way roads within fields in the areas of contributing large scale land patterns.

- **Large-Scale Land Patterns:** Land area that consists of open fields formed by the intersection of the canals and roads in the area bounded as follows: west of the East Levee; west of Sorrento Road, north of Del Paso Road between the East Levee and I-5, west of I-5 from its intersection with Del Paso Road to its intersection with I-80; north of I-80 from its intersection with I-5 to the River Levee; east of the River Levee; and south of the Cross Canal Levee.

Noncontributing resources include parts of the drainage system (some pumping plants and associated branch canals); parts of the road system; some large-scale land patterns (the area bounded by Sorrento Road to the east levee, south of Del Paso Road between I-5 and the east levee, south of I-80, and the Airport); and some land uses, vegetation, boundary demarcations, buildings, and structures such as those more closely associated with agriculture than reclamation, municipal structures, commercial structures, and electric power lines.

STUDY METHODOLOGY

This section describes the methods used to date to identify cultural resources in the study area and to satisfy the relevant statutory and regulatory framework. The methodology is consistent with state and federal standards, was developed to meet the requirements of CEQA and NHPA Section 106, and is consistent with the PA. All study elements described in this section have been completed by archaeologists that meet the Secretary of the Department of the Interior's professional qualification standards.

The cultural resource inventory efforts will be completed in phases, as access to project lands is acquired. A phased identification process is specifically authorized at 36 CFR Section 8004.2(b)(2):

> Where alternatives under consideration consist of corridors or large land areas, or where access to properties is restricted, the agency official may use a phased process to conduct identification and evaluation efforts. The agency official may also defer final identification and evaluation of historic properties if it is specifically provided for in a memorandum of agreement executed pursuant to § 800.6, a programmatic agreement executed pursuant to § 800.14 (b), or the documents used by an agency official to comply with the National Environmental Policy Act pursuant to § 800.8. The process should establish the likely presence of historic properties within the area of potential effects for each alternative or inaccessible area through background research, consultation and an appropriate level of field investigation, taking into account the number of alternatives under consideration, the magnitude of the undertaking and its likely effects, and the views of the SHPO/THPO and any other consulting parties. As specific aspects or locations of an alternative are refined or access is gained, the agency official shall proceed with the identification and evaluation of historic properties in accordance with paragraphs (b)(1) and (c) of this section.

The following sections describe background research conducted to identify existing resources and sensitivity of resources, completed identification efforts, and future work required under the phased approach.

NATIVE AMERICAN CONTACT PROGRAM

EDAW sent a letter of inquiry to the NAHC on June 12, 2007, asking for information or concerns regarding the project area, as well as a list of individuals or organizations that might have information or concerns regarding the project area (Appendix A). On June 19, 2007, Debbie Pilas-Treadway of the NAHC responded and indicated that no known sites were found in the Sacred Lands File that were located within the project area or in the immediate vicinity. Ms. Pilas-Treadway also provided EDAW with a list of individuals who could be contacted concerning cultural resources in the project area. These individuals were sent contact letters on June 21, 2007, with information regarding the proposed project and a request for any information they might provide or concerns that they might have about the project. No written responses were received; therefore, follow-up phone calls were made on July 9, 2007. Only one individual, Rose Enos (referred to by the NAHC as "Miwok/Maidu"), answered. Ms. Enos expressed general concern regarding avoidance of burial sites and asked to be contacted if work is conducted on such sites. Messages were left for the remaining people on the contact list; however, no response from any of these individuals has been received. In addition, EDAW contacted Randy Yonemura of the Ione Band of the Miwok to request information on areas of concern. Mr. Yonemura led an EDAW archaeologist on a field visit of the project area and provided anecdotal information on areas of potential Native American burials.

INFORMATION CENTER RECORDS SEARCHES

Records searches were conducted in stages in 2006 and 2007 for different portions of the proposed project footprint. Most of the searches were conducted at the North Central Information Center (NCIC) of the California Historical Resources Information System, located at California State University, Sacramento. The NCIC records search covered portions of the project area in Sacramento County. Records searches were also conducted at the

Northeast Information Center (NEIC), which maintains cultural resource records for Sutter County. The searches at both facilities included, but were not necessarily restricted to, an examination of the following resources:

- The State Office of Historic Preservation's *Historic Property Directory and Determination of Eligibility* (2006)
- The National and California Registers of Historic Places (2006)
- *California Inventory of Historic Resources* (1976 and updates)
- *Historic Properties Directory* (2006)
- *California Historical Landmarks* (1996 and updates)
- *California Points of Historical Interest* (1992 and updates)
- *Caltrans Local Bridge Survey* (1987)
- Various historic maps

The NEIC and NCIC reported that several cultural resource inventories have been conducted within the project area. These are listed in Tables 1 and 2, respectively.

Source: North Central Information Center Record Search 2007

Numerous archaeological investigations have covered portions of the Natomas Basin. These have generally focused on areas closest to the rivers and levees. There has been very little archaeological inventory of lands more than 100 feet from the levee toes, and ground surface visibility has frequently been poor even in surveyed areas.

The most comprehensive of these investigations were completed by Dames & Moore and Far Western. In 1994, Dames & Moore (1994b) conducted a broad survey in the Natomas Basin as part of the American River Watershed Investigation. Surveying of selected parcels along the Sacramento River resulted in the identification of 17 primarily historic sites. During the same effort, Dames & Moore visited an additional 10 previously identified cultural resources to update site records for those locations. At the same time, Dames & Moore (1994a) prepared a draft Historic Property Treatment Plan that explored the history and elements of RD 1000. In 1996, Dames & Moore completed its evaluation of RD 1000, concluding that it appeared to be eligible for listing on the NRHP under Criterion A at a state level of significance as an example of reclamation and flood control in the Sacramento River basin during the period 1911–1939. This report extensively documents both the contributing and noncontributing resources of RD 1000. Previously, in 1990, Far Western had conducted surveys of areas along the same route surveyed by Dames & Moore in 1994 (Dames & Moore 1994b), as well as of additional areas (Bouey and Herbert 1990). Far Western (Bouey, Berg, and Hunter 1991) followed up with limited test excavations of two sites that may be within or near the footprint of 2009–2010 project components (borrow areas) that have not yet been fully defined.

Numerous cultural resources were identified in the course of previous survey efforts, including ranches and farms; agricultural, transportation, and reclamation features; and debris scatters, as well as prehistoric occupation and burial sites consisting of mounds or the disturbed remnants of mounds (Tables 3 and 4).

EDAW FIELD SURVEYS

Fieldwork undertaken by EDAW in 2007 focused on the areas that would be affected by project construction in 2008: the NCC south levee, Sacramento River east levee Reaches 1–4B to Station 214+00, the proposed right-of-way of the relocated Elkhorn Canal and the new GGS/Drainage Canal, and potential borrow sites. EDAW conducted pedestrian surveys of those portions of these areas that were accessible; however, only a small proportion of the land area in the potential project footprint for 2008 was accessible to surveys, mainly because of the presence of crops. As access to the unsurveyed lands becomes available, pedestrian surveys will be completed in these areas.

In April/May 2007, an EDAW archaeologist examined the NCC south levee and adjacent lands within the existing maintenance right-of-way. In July/August 2007, a crew of EDAW archaeologists conducted field surveys in accessible parcels within Sacramento County–owned Airport bufferlands north of the Airport. On the Airport bufferlands, the surveys covered a 400-foot-wide strip east of the Sacramento River east levee and small portions of the proposed borrow sites in the Airport north bufferlands. Survey areas within 1,000 feet of the Sacramento River and the locations of prehistoric lakebeds were walked using transects 15 meters apart. Farther from the Sacramento River and prehistoric lakebeds, the transect interval was widened to 30 meters. The potential borrow sites were almost completely inaccessible because they contained rice crops. Exhibit 5 shows those portions of the project area that were surveyed by EDAW in 2007. Areas with poor ground surface visibility (i.e., less than 50%), would require subsequent survey at a time of year when ground surface visibility would be improved.

Two new historic sites, NLIP-1 and NLIP-2, were identified during the surveys adjacent to Garden Highway, and four groups of farm buildings, NLIP-3 through NLIP-6, were also identified and evaluated (Appendix B).

As mentioned above, Randy Yonemura of the Ione Band of the Miwok also showed an EDAW archaeologist the locations of subsurface cultural resources that have not been recorded in any of the previously prepared documentation filed with the NCIC and NEIC, which are known to him from anecdotal information.

IDENTIFIED CULTURAL RESOURCE SITES IN THE SUTTER COUNTY PORTION OF THE PROJECT AREA

Table 3 lists the known cultural resource sites in the Sutter County portion of the project area. Most of the listed sites are in areas proposed for 2009–2010 construction. The sites that may be affected by 2008 construction are shown with an asterisk. The sites listed in Table 3 are described below.

Table 3
Cultural Resources in the Sutter County Portion of the Project Area

Trinomial*	P-No.*	Historic/ Prehistoric	Description	Date Recorded	Quadrangle	NRHP/CRHR Status If Known
CA-SUT-84H*	51-000084	Historic	Natomas Cross Canal/Pleasant Grove Creek Canal levees	1994	Pleasant Grove, Verona	Eligible
	51-000096H*	Historic	1950s-era ranch	2002	Taylor Monument	
NLIP-3*		Historic	Farm Complex	2007	Verona	Not eligible

Barney Mound*		Prehistoric	Intact occupation mound site	not	Verona	Potentially eligible

Notes:
CRHR = California Register of Historic Resources; NRHP = National Register of Historic Places.
* Sites that would be or may be affected by the 2008 construction elements are marked with an asterisk.
Source: Data compiled by EDAW in 2007

CA-SUT-84H (P-51-000084)

This trinomial includes both the NCC south levee and the Pleasant Grove Creek Canal (PGCC) west levee, the northernmost contributing resources to RD 1000. The NCC levee measures approximately 25 feet wide at the top, 75 feet wide at the base, and 15 feet high. The top has been graded and graveled for vehicle traffic. The PGCC levee is smaller, measuring approximately 20 feet wide at the top, 60 feet wide at the base, and 10 feet high. There is also an associated retention basin, constructed of concrete and measuring 50 feet by 35 feet across and 15 feet deep. A concrete and steel pump foundation is located within the basin. Concrete footings running from a hole in the side of the basin to the top of the NCC levee indicate that a large pipe once connected the two features.

Archaeologists reported that the levee (unclear which one) was raised and strengthened twice, after flooding during 1938–1939 and after flooding in RD 1001 during 1955. RD 1000 modified the NCC south levee and its adjacent canals in 1987 and SAFCA modified them in 1996. SAFCA constructed a cutoff wall in the western portion of the NCC south levee in 2007.

P-51-000096H

Located on the Sacramento/Sutter county line and at the edge of a proposed borrow area, this resource consists of a historic ranch complex that includes two residences, four sheds or barns, and a trailer. The archaeological survey crew was not allowed on the property to record the structures in more detail.

NLIP-3, 7240 Garden Highway

The Sutter County Assessor's records currently list this property along the Sacramento River east levee south of Sankey Road as vacant. No construction date is on file for the buildings. The construction methods and materials appear to date to the early 20th century. This property appears to have always functioned as a residential and agricultural complex. The buildings are in good condition but lack the historic associations or architectural distinctions that would make them eligible for listing on the CRHR or NRHP.

NLIP-4, 11000 Garden Highway

This property is near the Sacramento River east levee north of Riego Road. The Sutter County Assessor's records list one of the two residences on the property as being constructed in 1957. The property has been in the Lauppe family since that time. The land, originally listed as Assessor's Parcel Number 35-020-15, was split into separate parcels several years ago as part of a lot-line adjustment. Because of the split, the 35-020-15 parcel number was retired, and additional parcel numbers (35-020-18, 35-020-19) were assigned.

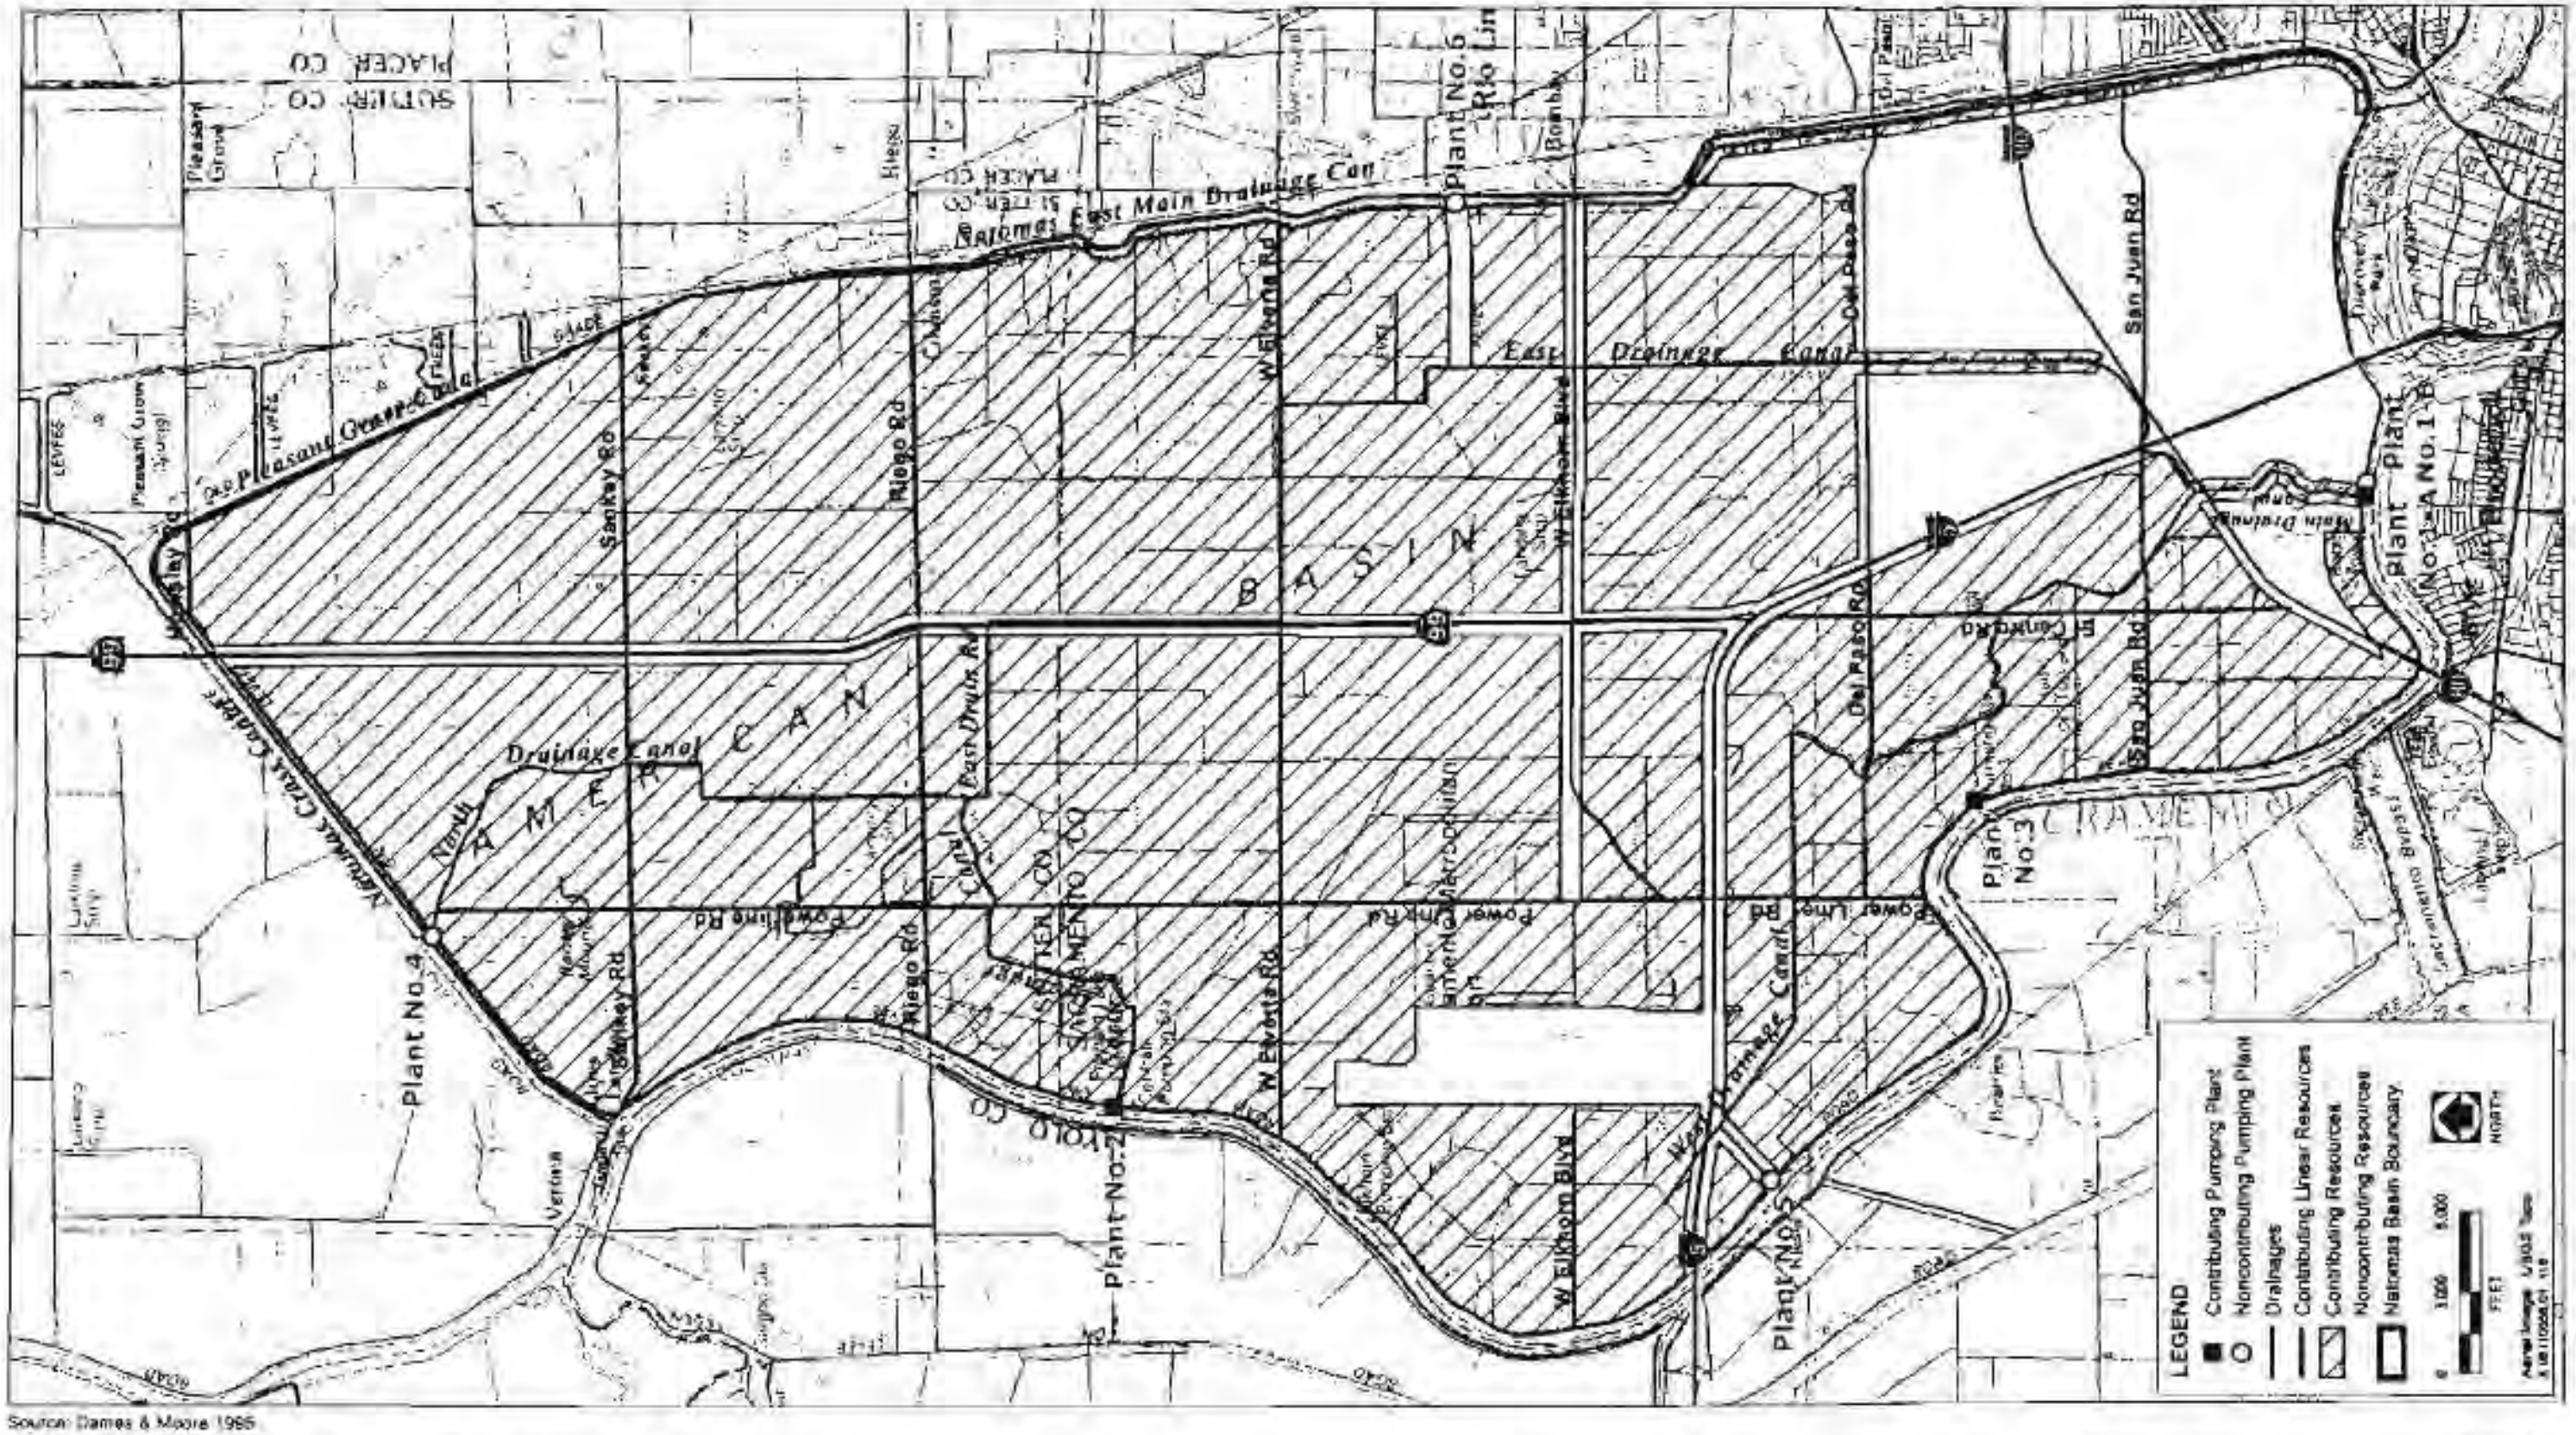
Research did not reveal this property to be significantly associated with an important historic event, and the historic-era building located here is not known to be associated with an individual considered important in local history. The property itself has undergone regular periods of construction over the years, with new buildings added and older structures modified. The buildings lack the historic associations or architectural distinctions that would make them eligible for listing on the CRHR or NRHP.

NLIP-5, Howsley Road at the Natomas Cross Canal

This small complex includes a mid-20th century residence and several turn-of-the-century horse stalls. The buildings are in good condition but lack the historic associations or architectural distinctions that would make them eligible for listing on the CRHR or NRHP.

Source: Aerial by SACOG 2005. Prepared by EDAW in 2007.

Survey Coverage Map **Exhibit 5**



Source: Dames & Moore 1985

Contributing Features of the RD 1000 Rural Historic Landscape District

Exhibit 4

NLIP-6, Howsley Road at the Pleasant Grove Creek Canal

This is a small residential complex dating to the mid-20th century. The buildings are in good condition but lack the historic associations or architectural distinctions that would make them eligible for listing on the CRHR or NRHP.

Barney Mound

This is an unrecorded prehistoric occupation mound with a residence on top, located along Powerline Road north of Sankey Road. Although the site has not been recorded officially, it is well known in the region and, as an intact prehistoric mound site in an area where almost all such sites have been destroyed, is likely to be eligible for CRHR and NRHP listing.

IDENTIFIED CULTURAL RESOURCE SITES IN THE SACRAMENTO COUNTY PORTION OF THE PROJECT AREA

Table 4 lists the known cultural resource sites in the Sacramento County portion of the project area. This table does not include several known sites in the southeastern portion of the Natomas Basin (located mainly along the Natomas East Main Drainage Canal [NEMDC]/Steelhead Creek) because there are no proposed project elements in that part of the basin. Most of the listed sites are in areas proposed for 2009–2010 construction. The sites that may be affected by 2008 construction are shown with an asterisk, and those that may be affected by 2009–2010 construction are shown with a plus sign. The sites listed in Table 4 are described below.

Table 4
Cultural Resources in the Sacramento County Portion of the Project Area

Trinomial*,+	P-No.*	Historic/ Prehistoric	Description	Date Recorded	Quadrangle	NRHP/CRHR Status if Known

Source: Data provided by EDAW in 2007

CA-SAC-15/H

This site, near the Sacramento River east levee south of I-5, consists of a prehistoric occupation midden mound with a concentration of debitage, flaked stone tools, shell artifacts, faunal remains, fire-cracked rock, and baked clay objects. The mound has been heavily affected by farming and ranching activities. There is a ranch complex including a bunkhouse, garden, shed, chicken coop, water tower, garage, and driveway on the mound; historic debris on the site includes glass and broken ceramic fragments. A limited auger testing program was carried out west of the mound along the Sacramento River east levee and found no cultural materials along that transect (Bouey and Herbert 1990), however the authors suggested that the site may have been mis-mapped.

CA-SAC-16/H (P-34-000043)

CA-Sac-16/H is south of the Airport on a property that would be a potential borrow source for the proposed project. This site has been variously called the Bennett Mound, Mound Ranch, Willey Mound, and S-16. It includes the remains of a prehistoric occupation mound, possibly the largest in the Sacramento Valley, but has been leveled in stages by agricultural activities. The site location corresponds to the ethnographic village of *Nawrean*. What remains today consists of dark midden soils in plowed fields with fragments of human remains, shell, fire-cracked rock, baked clay objects, groundstone, faunal bone, flaked stone artifacts, and debitage. A few historic artifacts, such as brick and ceramic fragments, are also present. Today, two separate loci have been identified and recorded as CA-Sac-16/H; the larger, Locus I, represents the approximate original location of the

mound. Locus II is an area of redeposited soil taken from the mound in the past. There is also a historic-era component of the site from the remnants of a slaughterhouse and brick factory present before the 1930s. Historic artifacts noted include bricks, sawed mammal bone, a filled-in privy, bottles, ceramic and metal fragments, and glass.

The site was originally described as very large, up to 7 acres in area, and 20 feet high. The earliest investigations were conducted in 1923 by Zallio, who excavated at the site a number of times and recovered projectile points, bone tools, Haliotis ornaments, and other artifacts (Bouey, Berg, and Hunter 1991). It was first formally recorded in 1934 by Heizer, who identified it as a large mound with stone artifacts and freshwater shell on the surface. Sacramento Junior College excavated pits and trenches up to 18 feet deep in 1936–1937. The main focus of this effort was on recovery of mortuary remains; however, considerable quantities of nonburial associated artifacts were also documented. More excavations were conducted by Sacramento State College in 1953 and by American River College between 1966 and 1971, and more artifacts and burials were salvaged by Peak, Crew, and Gerry (1984) when what was left of the mound was leveled. At that time, Peak, Crew, and Gerry estimated that as much as 13 feet of the mound might still be present below the plowed surface. As an interesting side note– and as an indication of the original CA-Sac-16/H mound's prominence—Peak, Crew, and Gerry mention that Heinrich Schliemann (an amateur archaeologist and later the discoverer of Troy) visited the site in 1851–1852.

More recently, Bouey and Herbert (1990) completed a surface survey and excavated two auger holes at the toe of the levee that forms the western boundary of the site; they reported evidence of subsurface cultural deposits, including shell midden. Larger-scale excavations (Bouey, Berg, and Hunter 1991), dug within 100 feet of the levee toe and the ramp leading up to Garden Highway, confirmed that midden deposits still exist; however, agricultural activity seems to have destroyed any stratigraphic integrity the deposits might have had that close to the levee. Testing farther from the levee toe was not undertaken.

The summary of the research done by 1991 (Bouey, Berg, and Hunter 1991) agreed with the conclusions of Derr (1983) that the site was a large, permanent habitation locus occupied from the Upper Archaic (ca. 1000 B.C.) to just after the beginning of European contact. Derr found that the upper 20–60 centimeters of soil (in the areas he examined near the levee) consisted of redistributed midden with artifacts and isolated human remains. What appears to be missing from any of these analyses is an attempt to define the original mound or to find intact elements of the site that may have been located beyond the original mound. If there are intact subsurface deposits associated with CA-Sac-16/H, then the site may be eligible for listing on the CRHR or NRHP because of the potential information contained in those deposits.

The earliest documentation, Heizer's site record form from 1934, does not give dimensions for the mound and does not contain specific enough information to provide for relocation of the original boundaries of the mound. It is presumed that the dispersed midden from the mound now covers a larger surface area than the mound used to occupy. However, it is unclear exactly how large an area that is because various investigations have reported Locus I (the larger site deposit) as measuring 110 meters by 185 meters (Bouey and Herbert 1990), 250 meters by 250 meters (Kauffman and Kauffman 1983), and 450 meters by 850 meters (Dames & Moore 1993). The Dames & Moore site record form appears to be the only one that maps out the secondary Locus II area, northeast of the main deposit and east of a drainage ditch (as of 1993).

CA-Sac-17 (P-34-000044)

This is the location of a mound site reported by Heizer in 1934 west of Fisherman's Lake; however, none of the mound remains. In 1990, Bouey and Herbert attempted to locate any cultural remains but could not find any evidence of cultural deposits on the surface or in auger holes. The site is near the Undercome Ranch.

CA-SAC-18 (P-34-000045)

This site, landward of the Sacramento River east levee north of San Juan Road, consists of a sparse scatter of basalt debitage, one cryptocrystalline biface fragment, a polished stone, and possible fire-cracked rock. It was originally described by Heizer as a mound 30 yards in diameter and 5 feet high; however, Heizer may have misinterpreted a natural rise in the landscape as a mound. CA-Sac-18 appears to be lacking the intensive cultural deposits that are the hallmark other nearby known mound sites (Dames & Moore 1994b).

CA-SAC-160/H (P-34-000187)

This is a multicomponent site near the Sacramento River east levee north of San Juan Road. It includes a prehistoric occupation mound with a farm complex situated on top. Excavations in the 1940s removed numerous burials and artifacts including groundstone, flaked stone tools, shell beads and ornaments, fire-cracked rock, baked clay objects, stone beads, faunal remains, bone awls, bird bone tubes and whistles, obsidian drills, quartz crystals, charmstones, and historic glass trade beads, as well as historic debris related to farming and occupation of the top of the mound.

CA-SAC-164 (P-34-000191)

CA-Sac-164 is a very large, deeply stratified prehistoric occupation and burial mound near Sand Cove Park on the Sacramento River that has been explored a number of times using archaeological techniques; however, in spite of these efforts, the true boundaries of the site remain unknown. The site includes shell midden with abundant cultural materials including fire-cracked rock, flaked and ground stone tools, charmstones, polished bone implements, debitage, quartz crystals, bone and shell beads, baked clay objects, and plentiful faunal remains. Large fire-cracked rock features and hearths have also been noted. Because of its significant scientific value and the integrity, CA-Sac-164 was nominated for NRHP listing in 2001.

The site was first recorded in 1951, after a newspaper article reported that human remains and stone tools were eroding out of the cutbank and into the Sacramento River. Observers who walked along the edge of the cutbank in summer and fall when the river was at its lowest noted that site deposits, interspersed with flood-deposited silt, extended at least 4 meters below the current-day surface. Excavations in the 1970s, 1980s, and 1990s confirmed the depth of intact and resource-bearing cultural strata at the site, at least along the river exposure. Work on the land side of the Sacramento River levee indicated that downward-trending cultural strata might be found there as well, beginning well over a meter below the ground surface, however the site's depth, extent, and boundaries have never been completely defined.

Annual river height fluctuation, wave action resulting from boat wakes, and looting combined to cause continual erosion and collapse of the cutbank. This resulted in artifacts and remains falling onto the beach area below, where they either washed into the river or collected by the public. To address this issue, a site stabilization program was implemented in 2005 that included placing dirt and plantings over the cutbank and creating a wave break near the river's edge of the site.

CA-SAC-430H (P-34-000457)

This feature is the West Drainage Canal, a relatively unmodified canal that originates at Fisherman's Lake and flows southeast to the East and Main Drainage Canals.

CA-SAC-485/H (P-34-000512)

This site, between the Sacramento River east levee and the proposed location of the relocated Elkhorn Canal, was once a prehistoric occupation and burial mound that has been leveled by agricultural activities and was documented by Dames & Moore in 1994. The remains of a historic-era homestead, consisting mainly of

ornamental vegetation, driveway, and historic debris, were noted on top of the prehistoric site. Dames & Moore archaeologists noted that the prehistoric component was large, measuring 220 meters by 160 meters with two depositional loci—a larger area near Garden Highway and a smaller deposit to the east. Prehistoric artifacts noted at the time included obsidian and basalt flakes and tools, shell beads and ornaments, faunal remains, groundstone fragments, charmstones, baked clay, imported exotic tool stone, and shell.

In August 2007, EDAW archaeologists undertook a limited shovel testing program at CA-Sac-485/H to determine whether there was an undisturbed subsurface deposit that could be affected by the proposed canal construction in the vicinity of this site (Exhibit 6). The August investigation began with a survey of the site area where a sparse assortment of artifacts was visible; because no concentrations of artifacts were identified on the surface, the Dames & Moore archaeological site map was used to guide the placement of shovel test pits (STPs). Brian Padilla, of the El Dorado Miwok, was present while the STPs were excavated.

During the course of excavations, archaeologists uncovered artifacts including obsidian and basalt flakes; clamshell disk beads; burned earth; faunal remains, including freshwater mussel shell; and fire-cracked rock. Human remains were uncovered in three of the STPs; the Sacramento County coroner and NAHC were contacted, excavation of each of those three STPs was halted immediately, and the remains were reburied where they were found. None appeared to be part of a larger, intact burial and all were found in the upper 50 centimeters of soil.

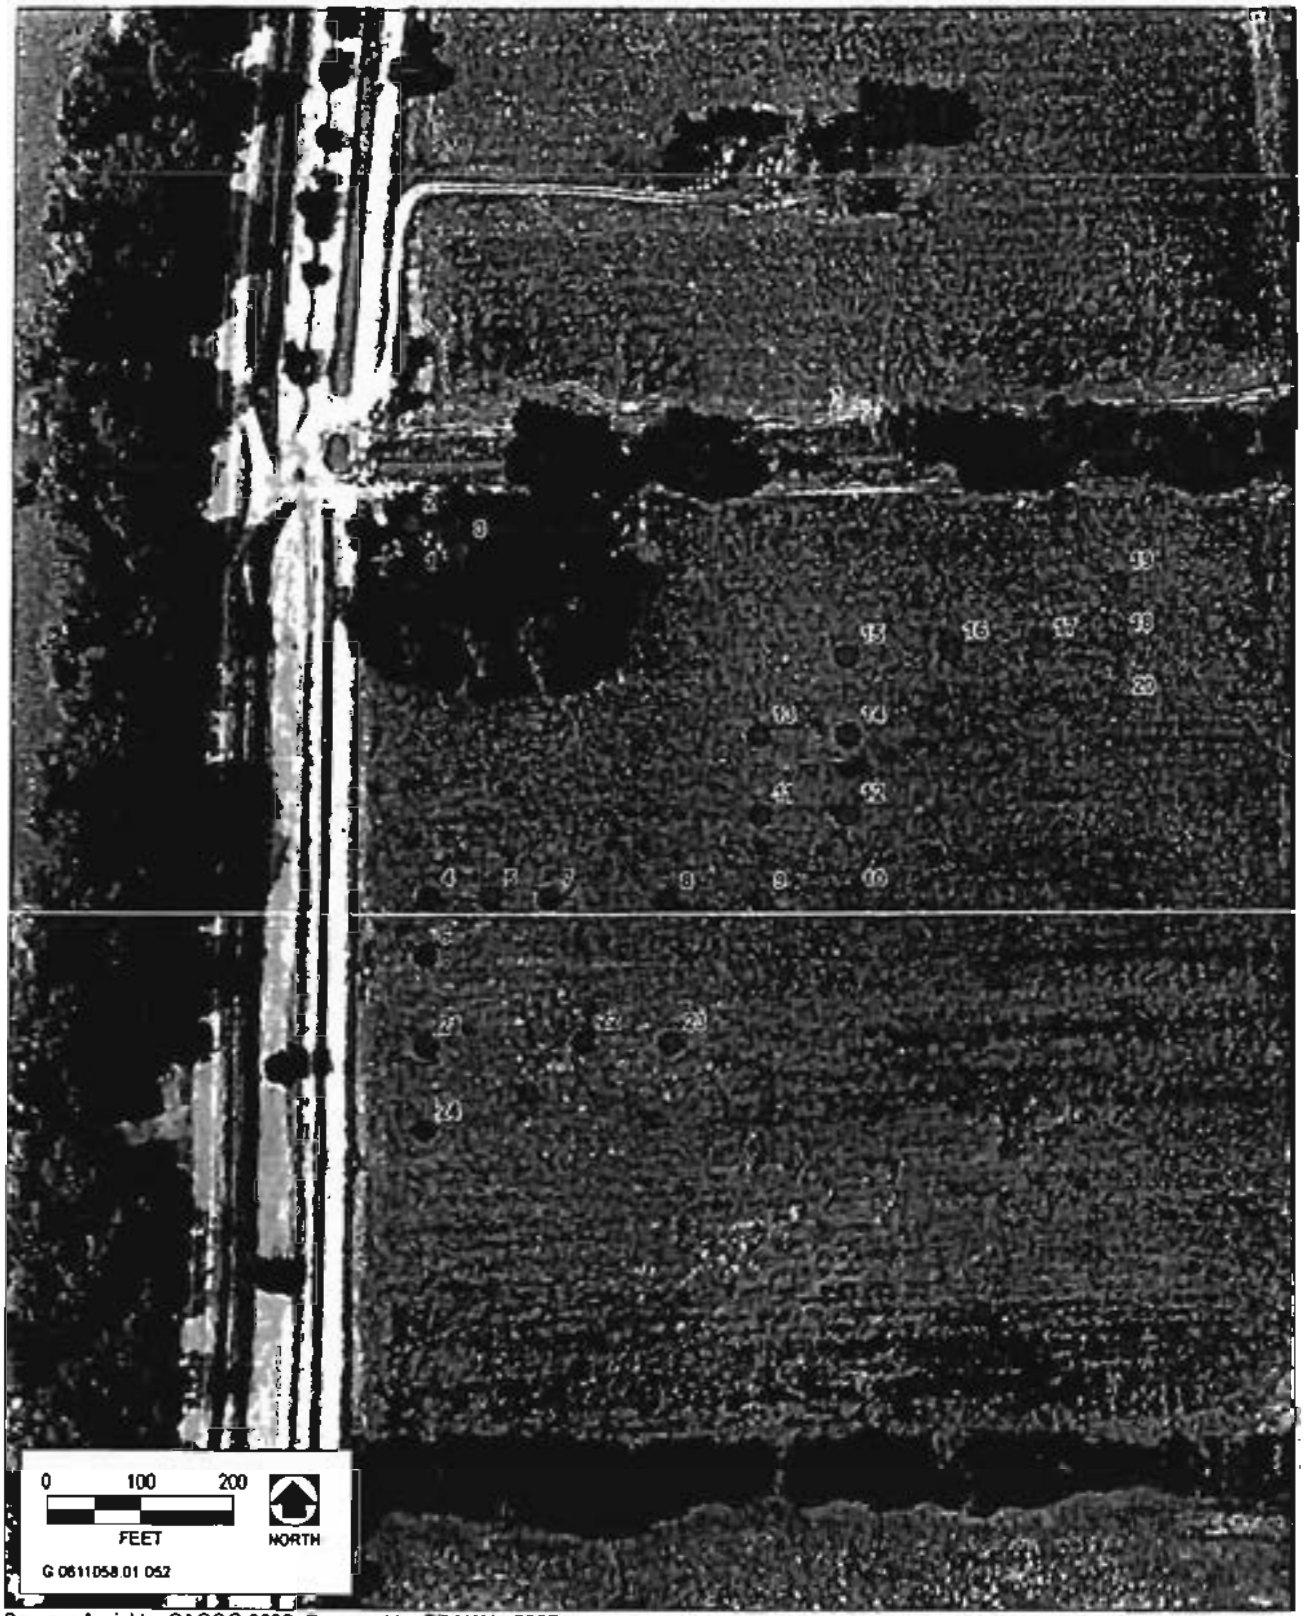
In general, site soils consisted of dry compact silts with a small sand and clay content; excavation and screening were difficult because the soils were very dry and hard. If artifacts were recovered, excavation generally proceeded to 100 centimeters below surface (cmbs); where no artifacts were found, excavations terminated around 80 cmbs. A deeply buried midden layer was identified in each of the four STPs (Nos. 4, 6, 21, and 24) closest to the levee, beginning anywhere from 55 cmbs to 80 cmbs. Excavation halted at approximately 100 cmbs in these STPs without reaching the bottom of the midden deposit; a split-spoon probe was used in STP No. 21 to find the bottom of the deposit, which was reached at approximately 160 cmbs. Although the northern and southern edges of the midden deposit were not located, the STP program was halted on the assumption that a more formal testing program, using a combination of test units and additional STPs, would be implemented as part of more detailed design of the proposed project. Based on the data collected during the brief testing at CA-Sac-485/H, it appears that significant intact prehistoric deposits may be found below capping soils at the site. If this is true, CA-Sac-485/H may be eligible for listing on the CRHR or NRHP for the site's data potential.

CA-Sac-486H (P-34-000513)

This site near the Sacramento River east levee below the North Drainage Canal consists of the remains of a historic-era homestead. The structure that once stood on the site has been demolished. Remnant landscape plantings and debris consisting of ceramic fragments, bottle glass, ceramic, bricks, mortar, and metal fragments were noted. The structures were visible in a 1937 aerial photograph and were depicted on the 1967 U.S. Geological Survey topographic quadrangle map. The archaeologists who identified the site in 1994 noted that some of the trees appeared to be less than 30 years old, although a fragment of amethyst glass (generally associated with the turn of the century) was noted.

CA-Sac-487H (P-34-000514)

Like CA-Sac-486H, this location near the Sacramento River east levee below the North Drainage Canal includes historic debris, such as concrete fragments, milled lumber, metal fence posts, wire, farm machinery parts, clear and green glass, window glass, and ornamental plantings, all of which indicate that a structure existed at the site at one point but has since been demolished. Also like the previous site, a structure was visible in this location in a 1937 aerial photograph; several structures were indicated on the 1950 and 1975 topographic quadrangle maps for the area.



Source: Aerial by SACOG 2006, Prepared by EDAW in 2007

CA-Sac-485/H Shovel Test Map **Exhibit 6**

CA-SAC-488H (P-34-000515)

This is another site near the Sacramento River east levee below the North Drainage Canal where a structure appeared on a 1937 aerial photograph and 1950 topographic quadrangle map, although no building is on the site today. Historic debris, ornamental vegetation, and a fence line remain. The debris included various concrete fragments, corrugated metal, wire, culvert pipe, and a large section of iron pipe.

CA-SAC-489H (P-34-000516)

This is another site near the Sacramento River east levee below the North Drainage Canal where a structure appeared on a 1937 aerial photograph and 1950 topographic quadrangle map, although no building is on the site today. The associated debris includes a fenced-off well head, concrete fragments, lumber, window glass, wooden posts, galvanized pipes, old fencing overgrown by an oak tree, an enamelware bucket, tires, ceramic fragments, bottle glass, and a metal bucket. Ornamental landscaping plants were also noted.

CA-SAC-490H (P-34-000517)

This site, near the south end of Powerline Road, had three structures that appeared on a 1937 aerial photograph and 1950 topographic quadrangle map, although no building is on the site today. The historic debris is similar to the debris found at sites CA-Sac-486H through CA-Sac-489H, including concrete, brick, iron piping, a fence post, bottle glass, ceramic fragments, and galvanized metal pipe, as well as remnant ornamental vegetation.

CA-SAC-491H (P-34-000518)

This site, also near the south end of Powerline Road, was likely used in association with four structures that appeared on the 1950 topographic quadrangle map. The 1937 aerial photograph associated with other sites listed here includes coverage of this property, however, only trees are clearly visible in the photograph. The artifacts consist of a sparse scatter, including a wood fence, concrete fragments, bricks, and metal fence posts. Ornamental vegetation was noted nearby.

CA-SAC-492H (P-34-000519)

This site, near the south end of Powerline Road, consists of a concrete-capped well, associated water pipes, and remnant ornamental vegetation and fruit trees that were likely associated with a structure visible on the 1950 topographic quadrangle map of the area. A cluster of trees is visible in the 1937 aerial photograph, but no structures are clearly visible. The site is now used to keep honeybees.

CA-SAC-493H (P-34-000520)

The 1950 topographic quadrangle map and 1937 aerial photograph of the region indicate that there was once a large barn and associated structure at this location near the Sacramento River east levee south of I-5. Today, scattered historic debris—clear and colored glass, porcelain and earthenware, iron pipe, bone fragments, brick, and a white ceramic insulator—is all that remains.

CA-SAC-494H (P-34-000521)

This is another site, west of Fisherman's Lake, where a structure appeared on a 1937 aerial photograph and 1950 topographic quadrangle map, although no building is present today. Associated debris documented by an archaeological team in 1994 included concrete and brick fragments, an iron water pipe, white ceramic insulators, and clear bottle glass. In addition, the archaeologists noted abundant modern debris on the site, making it difficult to distinguish between modern and historic artifacts.

ADDITIONAL EFFORTS TO BE UNDERTAKEN

The project area, including portions of the area that may be within the footprint of 2008 construction elements, has not been completely surveyed to date. As shown in Table 5, several sites that are potentially eligible for CRHR or NRHP listing may be affected by the proposed project, and elements of RD 1000 would be modified. For sites that do not appear to be eligible for listing in the NRHP or on the CRHR, or that are eligible but that would not be affected by a proposed project, no further action would be recommended. A draft Research Design is being prepared to describe recommended efforts to define the sites listed in Table 5 to determine the potential for their avoidance, if possible; methods for testing to determine their eligibility for listing as necessary; and a plan for identifying potential cultural resources that are not known from the published records.

In addition, for each phase of the NLIP Levee Improvements Project, the following efforts will be conducted:

- completion of pedestrian surveys for the entire project footprint, once access is acquired;
- preparation of further Cultural Resources Inventory Reports with recommendations of eligibility, finding of effects, and recommended mitigation measures; and
- preparation of a Historic Property Treatment Plan for resources determined to be eligible or recommended as eligible for NRHP listing, in accordance with Stipulation 4 of the PA.

RE: Natomas Levee Improvement Project

Dear Ms. Pilas-Treadway:

EDAW is conducting cultural resources studies for the above-referenced project located generally north of the City of Sacramento, in Sacramento and Sutter counties, and located on the Grays Bend, Taylor Monument, Verona, Rio Linda, Pleasant Grove, Sacramento East, and Sacramento West USGS quadrangle maps. Background research and field studies conducted for this project will identify cultural resources that may be impacted by proposed levee improvements throughout the American River basin. This letter is intended to initiate part of the consultation process that will eventually be required under Section 106 National Historic Preservation Act.

I am pleased to bring this activity to your attention, and would appreciate any information you can provide regarding prehistoric, historic, or ethnographic Native American land use. I am interested in any contemporary Native American values that may be present near or within the project area and would like to request a search of the NAHC Sacred Land files.

Please send via mail or facsimile (916-414-5850) a listing of local Native American representatives at your earliest convenience, so that I may contact appropriate individuals and account for their potential concerns in the planning process.

If you have any questions or comments feel free to contact me at my office. I can be reached by email at charlane.gross@edaw.com, or by phone at 916-414-5800. I look forward to hearing from you soon.

Sincerely,

Charlane Gross, M.A., R.P.A.

RE: Natomas Levee Improvement project, Sacramento and Sutter Counties

Dear Ms. Gross:

The Native American Heritage Commission has reviewed the Sacred Lands File and found several burial/recorded sites in/near the project area. The location of sites is confidential.

I recommend that you contact the North Central Information Center, Ca State University, Sacramento, 6000 J Street, Adams Building, Suite 103, Sacramento, CA 916-278-6217 for sites in Sacramento County and Northeast Information Center, Ca State University, Chico, Building 25, Suite 204, Chico, CA 95929, 530-898-4413 for Sutter County, for further information of recorded sites located in/near the APE.

I have enclosed a list of Native Americans individuals/organizations contacts may have knowledge of additional cultural resources in the project area. The Commission makes no recommendation or preference of a single individual, or group over another. These lists should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated, if they cannot supply information, they might recommend other with specific knowledge. A minimum of two weeks must be allowed for responses after notification.

If you receive notification of change of addresses and phone numbers from any these individuals or groups, please notify me. With your assistance we are able to assure that our lists contain current information. If you have any questions or need additional information, please contact me at (916) 653-4038.

If you have any questions or need additional information, please contact me.

Sincerely,

Debbie Pilas-Treadway

Subject: Natomas Levee Improvement Project(s)

To Whom It May Concern:

EDAW, Inc., an environmental firm, has been retained to complete an Environmental Impact Report (EIR) for various SAFCA (Sacramento Area Flood Control Agency) levee improvement projects throughout the American River Basin in both Sacramento and Sutter Counties (see attached map). There are few specific planned improvements as yet, but the projects may include levee strengthening or widening, excavation for slurry walls or canals, soil removal from various borrow sites throughout the basin, and similar types of projects. The work will be conducted over the next several years, but EDAW is collecting cultural resources information now to help guide planning decisions made for the individual elements of this much larger effort.

We would appreciate your help in identifying any concerns you or your community may have regarding any cultural resources in the study area. Please return the enclosed response form. Returning this form does not imply that you approve or disapprove of the study, nor does it limit your opportunity to comment at a later time. Efforts to address your concerns will be included in the planning process.

In order to incorporate your concerns and/or input in any forthcoming reports, we would appreciate receiving your comments by July 10th.

If you have questions, please contact me at (916) 414-5800.

Sincerely,

Charlane Gross, M.A., RPA
Senior Archaeologist

Subject: Natomas Levee Improvement Project(s)

Dear Mr. Kerfoot:

EDAW, Inc., an environmental firm, has been retained to complete an Environmental Impact Report (EIR) for various SAFCA (Sacramento Area Flood Control Agency) levee improvement projects throughout the American River Basin in both Sacramento and Sutter Counties (see attached map). There are few specific planned improvements as yet, but the projects may include levee strengthening or widening, excavation for slurry walls or canals, soil removal from various borrow sites throughout the basin, and similar types of projects. The work will be conducted over the next several years, but EDAW is collecting cultural resources information now to help guide planning decisions made for the individual elements of this much larger effort.

We would appreciate your help in identifying any concerns you or your community may have regarding any cultural resources in the study area. Please return the enclosed response form. Returning this form does not imply that you approve or disapprove of the study, nor does it limit your opportunity to comment at a later time. Efforts to address your concerns will be included in the planning process.

In order to incorporate your concerns and/or input in any forthcoming reports, we would appreciate receiving your comments by July 10th.

If you have questions, please contact me at (916) 414-5800.

e. Other Locational Data: (e.g., parcel #, directions to resource, elevation, etc., as appropriate)
The lean-to structure, shed, associated debris and looter's pit are located approximately (?) feet east of Garden Highway, south of the intersectionof Garden Highway Reigo Road.

P3a. Description: The dilapidated remains of of a structure and shed include a rectangular wood frame "lean-to" style building with a corrugated metal roof, which stands on a concrete pad, and a smaller , square wooden shed. An assortment of debris litters the area between the two structures and includes; white earthenware, tires, window glass, clear and brown bottle glass, corrugated metal sheets, and rusted metal objects., milled lumber fragments, tires, window blind fragments, and pieces of dislodged mortar. Also, what appears to be a looter's pit is nearbay with 1950'5 and 1960's era bottles, plastic, and a porcelain drawer pull within or near it. The site was found in a dense cluster of trees, poison oak and blackberry brambles; the numerous blackberry bushes and other groundcover obscure the availability of a full description of the structure. None of the site components appeared to be more than 40-50 years old. The Taylor Monument USGS quadrangle indicates two structures that match the site location, and both of these appear as a part of the 1980 photorevision of the 1967 original. This site does not appear to contain values that would make it eligible for listing on the CRHR or NRHP.

e. Other Locational Data: (e.g., parcel #, directions to resource, elevation, etc., as appropriate)
East of the Garden Highway approximately (?) feet

P3a. Description: This site consisted of a small historic debris scatter noted in a dirt farm road east of the Sacramento River East Levee and a drainage ditch. There appeared to be a mix of modern debris and a fragment of amnethyst glass. It is presumed that this deposit was relocated from one of the nearby farm sites. The mixture of historic and modern debris and the location in an area disturbed by levee, ditch, and road construction all indicate that this site does not retain sufficient integrity to make it eligible for listing on the CRHR or NRHP.

Sutter County Assessor's records currently list this property as vacant. No construction date is listed on file for the buildings; however the construction methods and materials appear to date to the early twentieth century.

The earliest known owners of this property were G.H. Lyall and Hardin et al. Currently, the property is owned by William C. Cummings (Verona Farming Partnership). Cummings received ownership of the parcel in October 2004, in a grant deed from Metro Air Park, LLC (Assessor document # 0029189). (see Continuation)

P3a (Description) continued:

This building is partially obscured by tree cover, and was not completely visible during the field visit. The building appeared to be situated on a concrete foundation.

Shed 1

A wood-frame shed is located northeast of the house. This building features a saltbox roof with exposed rafter tails. Sash window openings (minus glazing) are located on the northern elevation. The east façade displays two single-entry doors.

House 2

This building is a single-story, wood-frame house with a corrugated metal roof and little eave overhang. The exterior of this building features shiplap siding. A boarded up window opening is present on the eastern façade. This building sits upon a concrete foundation.

House 3

This is a wood-frame building with a partially collapsing flat roof. A porch, supported by square wooden posts, is located on the western elevation. This building is partially concealed by tree cover, and was not completely visible during the field visit.

Shed 2

This small building is of wood construction and features a shed roof.

B10 (Significance) continued:

This property appears to have always functioned as a residential and agricultural complex. Research did not reveal the property to be significantly associated with an important historic event (CRHR Criterion 1). Little information was found on early owners of the property, George Lyall and James Hardin. Lyall was originally from Illinois, and settled in the Verona Township of Sutter County sometime between 1880 and 1900. Hardin was originally from Tennessee, and settled in the Nicolaus Township of Sutter County around the same time (Sutter County Census records). Neither the property nor known past owners are listed in the various secondary references reviewed during this study which chronicled significant properties and pioneers in Sutter County history.

The buildings on this property do not appear to be significantly associated with an important individual(s) in local history (CRHR Criterion 2). Although the buildings appear to exhibit a good degree of integrity, they do not embody distinctive architectural characteristics, nor do they represent the work of a master (CRHR Criterion 3). While buildings and structures can sometimes provide important information on historic construction techniques and technologies, these types of buildings are well represented in both written and visuals sources, and do not appear likely to yield important primary information (CRHR Criterion 4). These buildings do not appear to be eligible for listing on the CRHR.

This residential complex is mostly comprised of contemporary (post-1957) buildings. Sutter County Assessor records list one of the two residences on the property as being constructed in 1957. The property has been in the Lauppe family since this time. The parcel is currently owned by Alan Lauppe, who received the property from Burton and Kathryn Lauppe in December 2006 (Assessor document # 0030459). (see Continuation).

B10 (Significance) continued:

The land, originally listed as APN: 35-020-15, was split into separate parcels several years ago due to a lot line adjustment. Because of the split, the 35-020-15 parcel number was retired, and additional parcel numbers (35-020-18, 35-020-19) were assigned (Sutter County Assessor).

Research did not reveal this property to be significantly associated with an important historic event (CRHR Criterion 1). The historic-era building on this property is not known to be associated with an individual(s) considered important in local history (CRHR Criterion 2). The property itself has undergone regular intervals of construction over the years, with new buildings (e.g. garage-1987, second residence- 1977, and sheds) being built on the property. The historic-era residence maintains only a fair degree of integrity; the porch on the southern façade has been enclosed, and some of the windows have been replaced over the years. This simple vernacular building, in its current configuration, does not embody distinctive architectural characteristics, nor does it appear to be the work of a master (CRHR Criterion 3). This type of building is well represented locally and on a state-wide level, and therefore does not appear likely to yield important primary information (CRHR Criterion 4). This building does not appear eligible for CRHR listing.

The historic-era buildings on this property include a residence, and what appear to be stalls. The residence was constructed in 1952 (Sutter County Assessor's records). The two stalls, although not listed in the assessor's records, appear to predate the residence by approximately 10 – 15 years.

The residence on the property is partially obscured by tree cover, and was not completely visible during the field visit. What was visible showed a single-story residence with an overall L-shape plan, and cross-gable roof. A full-width porch is present on the southern façade. This building sits upon a concrete foundation. (see Continuation).

The community of Pleasant Grove was established ca. 1867 at its present location. Originally known as Gouge Eye, the name was changed to Pleasant Grove Creek that same year when a post office was established. In 1875 the name was shortened to the present name Pleasant Grove.

Early buildings in the community included a saloon, hotel, boarding house, shoe shop, schoolhouse, and doctor's office. Approximately a dozen dwellings and two blacksmith shops were located in the immediate vicinity. The primary impetus to the economy was agriculture, with grain and livestock forming the principal crops. In later years rice also became an important crop. (see Continuation).

P3a (Description) continued:

The stalls on this property are of wood construction, and feature horizontal milled wood, and shed roofs covered with corrugated metal. Openings are located on the buildings northern facades. The buildings are in disrepair, and feature sway braces propped against the southern façade of the eastern-most stall. These stalls are situated upon earthen foundations. Other buildings on this property include modern trailers and metal-covered sheds.

B10 (Significance) continued:

One of the largest early ranches in Pleasant Grove was the Spanish Ranch. It contained 2000 acres, and was owned by State Senator Frederick Cox of Sacramento County. The land was later leased by Reese D. Murphy who farmed it for several years (Wagner 1992). Over the years, the Spanish Ranch was broken up into smaller parcels, of which the subject property was part.

2434 Howsley Road (APN: 35-050-030)

This property is zoned as an animal farm. The Sutter County Assessor's Office lists the residence on this property as having been built in 1952. The earliest known owners of the property were N.P. Rogers and an individual with the initials F.E.F. Today, the property is owned by Warren A. Shelley (Sutter County Assessor's records).

This property also appears to be a parcel which was originally part of the larger Spanish Ranch. This property has always functioned for agricultural (husbandry) purposes. Because none of the existing buildings appear to date to the property's earliest usage, research did not reveal the property, in its current configuration, to be significant within that theme (CRHR Criterion 1). This property is not associated with person(s) considered important in local or state history (CRHR Criterion 2). Little information was found on Nathaniel Rogers, other than that he was an early settler in Pleasant Grove. F.E.F. could possibly have been Eben Fifield, of which there is currently a road named near the project area. Fifield, born in Maine in 1834, came to California in 1859. He resided in Amador County for approximately nine years, then in San Joaquin County for approximately five years. He later settled in Sutter County (Thompson and West 1879). Although these individuals were early settlers in the community, none of the existing buildings on the subject property date to their ownership/occupation. None of the buildings, therefore, have an association to, or are eligible for CRHR listing due to an association with these individuals.

The subject buildings on this property retain a good degree of integrity, however, they do not display distinguishing architectural characteristics; nor do they appear to be the work of a master (CRHR Criterion 3). While buildings and structures can sometimes yield important information on historic construction techniques or technologies (CRHR Criterion 4), these types of buildings are well documented in both written and visual material, and do not appear to be sources of important primary information. These buildings do not appear to be CRHR eligible.

P3a (Description) continued:

This wood-frame, corrugated metal-covered building displays a salt-box shaped roof, and 3 bays on its northern façade. This building is contemporaneous with the residence. The other buildings on this property are contemporary and include: a large metal storage building, a second residence, and a second garage.

B10 (Significance) continued:

One of the largest early ranches in Pleasant Grove was the Spanish Ranch. It contained 2000 acres, and was owned by State Senator Frederick Cox of Sacramento County. The land was later leased by Reese D. Murphy who farmed it for several years (Wagner 1992). Over the years, the Spanish Ranch was broken up into smaller parcels, of which the subject property was part.

2145 Howsley Road (APN: 35-080-025)

This property, in its current configuration, has always functioned as a residential complex. Other parcel numbers for this property have included 35-080-002, and 35-080-023, both of which have been retired (Sutter County Assessor's records).

The property appears to have originally been part of the larger Spanish Ranch, which was later split into several smaller parcels. The earliest known occupants of this parcel were R. Murphy and M. Donaldson. Today the owner of the property is listed as Morrison 2000 (Sutter County Assessor's records).

Research did not reveal this property, in its current configuration, to be associated with an important historic trend or event (CRHR Criterion 1). This property is not known to be associated with an individual considered important in local or state history (CRHR Criterion 2). R. Murphy, born in Missouri in 1863, came to California with his mother in 1872. They settled in Nicolaus, and later purchased a ranch at Pleasant Grove. Mary Donaldson was the wife of Alex, a farmer and stock-raiser. Alex Donaldson came to Sutter County ca. 1861. He was in the mercantile business for a short time, before turning to agriculture. He married Mary Pierce on June 30, 1869 (Thompson and West 1879). Alex stops appearing in the Sutter County Census records in 1900, and is presumed to have died sometime between 1880 (last census he appears in) and 1900. The 1890 census was destroyed in a fire. Although these individuals were early settlers in the community, none of the existing buildings on the subject property dates to their ownership/occupation. None of the buildings, therefore, have an association to, or are eligible for CRHR listing due to an association with these individuals.

Although the buildings retain a good degree of integrity, they are vernacular in style to the 1950s, and do not display distinguishing architectural characteristics that make them notable examples of vernacular architecture. These buildings do not represent the work of a master (CRHR Criterion 3). While buildings and structures can sometimes yield important information on historic construction techniques or technologies (CRHR Criterion 4), these types of buildings are well documented in both written and visual material, and do not appear to be sources of important primary information. The buildings on this property do not appear to be eligible for listing on the CRHR.

SACRAMENTO, CALIFORNIA 95814-2922

REPLY TO
ATTENTION OF

Environmental Resources Branch

Mr. Milford Wayne Donaldson
State Historic Preservation Officer
Office of Historic Preservation
P.O. Box 942896
Sacramento, California 94296-0001

Dear Mr. Donaldson:

Pursuant to the provisions of Section 106 per 36 CFR Section 800.3(c)(3) the U.S. Army Corps of Engineers (Corps) is initiating consultation regarding the issuance of approvals and permits for the Natomas Levee Improvement Program Landside Improvements Project (NLIP.) This letter describes the project proposed by Sacramento Area Flood Control Agency (SAFCA), the NLIP, and the approach proposed by the Corps for satisfying Section 106 of the National Historic Preservation Act (NHPA) for this undertaking. The project is intended to provide urgently needed flood control system improvements and provide at least 100-year flood protection as quickly as possible to the Natomas Basin in southern Sutter and northern Sacramento Counties (Enclosure 1), while laying the groundwork to achieve at least urban-standard ("200-year") flood protection over time.

The project includes improving various portions of the Natomas Basin flood control system and making related landscape and irrigation/drainage infrastructure modifications in three phases in 2008, 2009, and 2010. Enclosure 2 shows the anticipated phases of construction along the levee system. Project activities are summarized as follows and more details are provided in Enclosure 3:

2008 construction

- Along the 5.3-mile Natomas Cross Canal (NCC) south levee, raise the levee to provide additional freeboard; realign the levee to provide a more stable waterside slope and to reduce the need for removal of waterside vegetation, and construct a seepage cutoff wall in the eastern 4.3 miles (approximately) of the levee to reduce the risk of levee failure due to seepage and stability concerns.

- Along the Sacramento River east levee, construct a raised adjacent setback levee from the NCC to about 3,100 feet south of the North Drainage Canal with seepage berms where required to reduce seepage potential, and install woodland plantings.

- Construct a new canal designed to provide drainage and associated giant garter snake habitat (referred to in this EIR as the "GGS/Drainage Canal"), relocate the Elkhorn Canal between the North Drainage Canal and the Elkhorn Reservoir settling basin ("Elkhorn Reservoir"), and remove a deep culvert from under the levee near the Reclamation District 1000 Pumping Plant No. 2 site.

- Re-contour the land and create marsh and upland habitat at borrow locations.

2009 and 2010 construction

Along the Sacramento River east levee south of the limits of the 2008 improvements, construct an adjacent setback levee (raised where needed to provide adequate freeboard) with seepage berms, relief wells, and cutoff walls as required, and install woodland plantings.

- Widen the levee and construct seepage berms along the Pleasant Grove Creek Canal west levee.

- Construct a new GGS/Drainage Canal between Elkhorn Reservoir and the West Drainage Canal, improve the West Drainage Canal, relocate the Riverside Canal and the Elkhorn Canal downstream of Elkhorn Reservoir, and reconstruct the Reclamation District 1000 Pumping Plant No. 2.

  Re-contour the land and create marsh and upland habitat at borrow locations.

- Remove encroachments from the water side of the Sacramento River east levee as needed to ensure that the levee can be certified as meeting the minimum requirements of the National Flood Insurance Program and USACE design criteria, and address Federal Emergency Management Agency (FEMA) requirements for the State Route 99/70 bridge crossing of the NCC.

Through discussion with your office, we have determined that a Programmatic Agreement (PA) is the appropriate vehicle for satisfying Section 106. The nature of the undertaking, the cultural resources management efforts required, and the necessary federal authorizations and permits require a departure from the process for satisfying Section 106 described in 36 CFR Section 800 et. seq. The standard Section 106 process requires federal agencies to identify all historic properties, determine the effect of the undertaking on those resources, and complete dialogue with consulting parties before Section 106 is complete. For the following reasons, this procedure is not possible in this instance:

- The applicant requires both permission to alter federal flood control structures under Section 408 of the Rivers and Harbors Act (33 U.S. Code Section 408) and one or more individual permits to discharge fill to jurisdictional waters under Section 404 of the Clean Water Act (33 U.S. Code Section 1344). The Section 408 permission will be granted separately for each year of project construction, corresponding to the three years of project work (2008, 2009, and 2010) that collectively constitute the entire project.

- The undertaking will likely have an adverse effect on at least one historic property, CA-Sac-485/H. This adverse effect must be resolved via the Section 106 process, and the method of resolution should be documented in an agreement document.

- The Area of Potential Effect (APE) will consist of the work described in the Environmental Impact Report (EIR) on the Natomas Levee Improvement Program Landside Improvements Project. The exact APE for all phases of construction remains unclear.

- The applicant is in the process of acquiring rights-of-entry, easements, and ownership interests in the project footprint where effects on historic properties may occur. This phased access will require an ongoing effort to inventory historic properties in the APE, rather than a single inventory effort.

- The project includes landside improvements to the levee along the east bank of the Sacramento River, an area that is sensitive for buried archaeological sites. The method for dealing with unanticipated discoveries needs to be in an agreement document and described in detail in a manner that incorporates the framework provided in 36 CFR Section 800.13 *Post-review Discoveries*.

- The complexity and phased nature of the project dictates that ongoing consultation with federally recognized tribes and other Native American groups and individuals is the best method for incorporating their concerns and input.

The Corps proposes that SAFCA, the USACE, and the SHPO adopt a Programmatic Agreement (PA) providing for a phased identification of resources and assessment of effects. We have included a draft PA (Enclosure 4) for your consideration. Upon receipt of your concurrence, we will notify the Advisory Council on Historic Preservation (ACHP) pursuant to 36 CFR Section 800.14 et. seq. If the ACHP declines to participate, we will collaborate with your office to develop and finalize the management framework provided in the PA. If you have any questions or need any additional information, please do not hesitate to contact me so that we can remedy any information gaps. Comments or questions may be sent to Mr. Daniel A. Bell, U.S. Army Corps of Engineers, CESPK-PD-RA, 1325 J Street, Sacramento, California 95814; email at daniel.a.bell@usace.army.mil; phone at (916) 557-6818, or fax at (916) 557-7856.

Sincerely,

Francis C. Piccola

SACRAMENTO, CALIFORNA 95814

REPLY TO
ATTENTION OF

Environmental Resources Branch

FEB 1 - 2008

Ms. Jessica Taveres, Chairperson
United Auburn Indian Community of Auburn
575 Menlo Drive, Suite 2
Rocklin, California 95765

Dear Chairperson;

The U.S. Army Corps of Engineers (Corps), Sacramento District, is writing you in accordance with the National Historic Preservation Act, to inform you of the proposed Natomas Levee Improvement Program Landside Improvements Project (Project) located along the Sacramento River in Sutter and Sacramento Counties. The project requires that the Sacramento Area Flood Control Agency obtain permits from the U.S. Army Corps of Engineers, Sacramento District (Corps), and is therefore considered a federal undertaking pursuant to Section 106 of the National Historic Preservation Act (NHPA) and is subject to the requirements of Section 106 of the National Historic Preservation Act. We are also inviting you to participate as a concurring party in the development and execution of a Programmatic Agreement (PA). The Area of Potential Effects (APE) for the proposed project is shown on the enclosed topographic map (enclosure 1).

The proposed project is intended to provide urgently needed flood control system improvements and provide at least 100-year flood protection as quickly as possible to the Natomas Basin in southern Sutter and northern Sacramento Counties, while laying the groundwork to achieve at least urban-standard ("200-year") flood protection over time.

The proposed project includes improving various portions of the Natomas Basin flood control system and making related landscape and irrigation/drainage infrastructure modifications in three phases in 2008, 2009, and 2010. Enclosure 2 shows the anticipated phases of construction along the levee system. Project activities are summarized as follows:

2008 construction

- Along the 5.3-mile Natomas Cross Canal (NCC) south levee, raise the levee to provide additional freeboard; realign the levee to provide a more stable waterside slope and to reduce the need for removal of waterside vegetation, and construct a seepage cutoff wall in the eastern 4.3 miles (approximately) of the levee to reduce the risk of levee failure due to seepage and stability concerns.

- Along the Sacramento River east levee, construct a raised adjacent setback levee from the NCC to about 3,100 feet south of the North Drainage Canal with seepage berms where required to reduce seepage potential, and install woodland plantings.

- Construct a new canal designed to provide drainage and associated giant garter snake habitat (referred to in this EIR as the "GGS/Drainage Canal"), relocate the Elkhorn Canal between the North Drainage Canal and the Elkhorn Reservoir settling basin ("Elkhorn Reservoir"), and

remove a deep culvert from under the levee near the Reclamation District 1000 Pumping Plant No. 2 site.

- Recontour the land and create marsh and upland habitat at borrow locations.

2009 and 2010 construction

- Along the Sacramento River east levee south of the limits of the 2008 improvements, construct an adjacent setback levee (raised where needed to provide adequate freeboard) with seepage berms, relief wells, and cutoff walls as required, and install woodland plantings.

- Widen the levee and construct seepage berms along the Pleasant Grove Creek Canal west levee.

- Construct a new GGS/Drainage Canal between Elkhorn Reservoir and the West Drainage Canal, improve the West Drainage Canal, relocate the Riverside Canal and the Elkhorn Canal downstream of Elkhorn Reservoir, and reconstruct the Reclamation District 1000 Pumping Plant No. 2.

- Recontour the land and create marsh and upland habitat at borrow locations.

- Remove encroachments from the water side of the Sacramento River east levee as needed to ensure that the levee can be certified as meeting the minimum requirements of the National Flood Insurance Program and USACE design criteria, and address Federal Emergency Management Agency (FEMA) requirements for the State Route 99/70 bridge crossing of the NCC.

The level of effort towards identifying historic properties will be conducted pursuant to 36 CFR 800.4(b)(1) and will include an updated records and literature search, and field survey. We have developed a draft PA to take into account any adverse affects to historic properties as a result of project construction. A PA is a compliance document that specifies procedures that a Federal agency will follow on a project when all of the potential adverse effects are not known. PA's are negotiated and executed between the Federal agency, the State Historic Preservation Officer, and occasionally the Advisory Council on Historic Preservation. Stipulations in the draft PA have been included to take into account any issues or concerns that you may have regarding cultural resources and potential adverse effects on them. We are also requesting information regarding the presence of any traditional cultural properties, sacred sites, or other areas of cultural interest to the members of the Paskenta Band in the project area. A copy of the draft PA is provided for your review and comment (enclosure 3).

We request that you respond within 45 days of receipt of this letter. We would appreciate knowing if you wish to participate in consultation on the PA, and we welcome your comments and suggestions that you may have. Please direct any comments on the draft PA, cultural resources investigation, or any other aspect of our work on the Project to Mr. Daniel A. Bell, Archeologist, at (916) 557-6818, email: daniel.a.bell@usace.army.mil. Questions regarding the overall project may be directed to Mr. Daniel Tibbits, Project Manager, at (916) 557-7372, or email dan.p.tibbits@usace.army.mil. Your time and consideration are greatly appreciated.

Sincerely,

Francis C. Piccola
Chief, Planning Division

Re: Draft Programmatic Agreement for the Natomas Levee Improvement Program; Notification of Ongoing Consultation Issues Arising from Ongoing Work at Site

Dear Mr. Dutschke, Col. Chapman, Ms. Brown, Mr. Buer, and Mr. Bassett:

The Shingle Springs Band of Miwok Indians [the Band], designated as the Most Likely Descendant [MLD] by the Native American Heritage Commission, takes this opportunity to provide preliminary comments on the proposed Programmatic Agreement and to request formal consultation before the Programmatic Agreement is finally negotiated, especially to include protocols for the respectful treatment and disposition of human remains, associated funerary objects, and other cultural items.

As a preliminary matter, we wish to advise the addressed agencies that by this letter the Band does not intend to imply that the agencies have not tried to contact the Band's prior representative for these matters, Mr. Jeff Murray. In order to avoid any further delays, the Band has identified John Tayaba, Tribal Vice Chair, to take all responsive actions with regard to our obligations as MLD. Please also understand that our comments are preliminary. The Band has asked our attorney, Brigit S. Barnes, to review the proposed Programmatic Agreement, relevant portions of the NLIP Landside Improvements EIR, and related federal reviews so as to advise Mr. Tayaba on these matters, as well as a pressing issue which must be addressed regardless of the status of negotiations on the Programmatic Agreement. We ask that copies of any and all correspondence to the Band be sent to Mrs. Barnes at Brigit S. Barnes & Associates, Inc., 3262 Penryn Road, Suite 200, Loomis, CA 95650; Telephone: (916) 660-9555; Fax: (916) 660-9554; Email: bsbarnes@landlawbybarnes.com.

Please also consider this letter to request that the Band be treated as a "consulting party" for the Programmatic Agreement, and for all future work along the Natomas River, pursuant to 36 CFR 800.3(f)(3).

1. Possible Disrespectful Treatment of Native American Remains During Sampling by EDAW On Site

The Band has been informed, and its preliminary investigation confirms, that while EDAW was conducting small-scale shovel testing along the eastern side of CA-Sac-485/H, a preliminarily identified burial site was rough-dug, thus resulting in potential damage to the human remains located within the pit. Based on what we have been informed of, the treatment of the site overall does not comport with state or federal law, and we request an immediate investigation into the manner of excavation used by EDAW at the site.

2. Comments to Draft Programmatic Agreement [PA]

General. Has the Advisory Council on Historic Preservations Been Invited to Participate? We request that the Council be involved or otherwise have an opportunity to comment if consultation with the Tribes is inadequate. We do not know whether any of the Tribes identified in the NLIP EIR have been given an ability to speak to the language of this PA, or been invited to be formal signatories to this PA. As the MLD, we request the right to be a formal signatory to this PA after negotiation.

I. DEFINITIONS

APE. The Native American community should be allowed to comment on the Area of Potential Effects [APE] before it is altered. We formally request that the PA definition notes that "the Tribes have been consulted about the nature and location of the APE and their concerns have been adequately considered", or some similar language.

Cultural Resources. It is appropriate to include traditional cultural places in this definition, but traditional cultural properties should be moved to the following definition.

"Historic Property" explicitly includes traditional cultural properties as properties of value to cultural groups that have been determined eligible for or are listed on the National Register of Historic Places.

II. STANDARDS

(A.) Professional Qualifications. Please include specific mention of an ethnographer for places of value to the Native American community. The perspective of the Tribes needs to be addressed by a professional who understands and communicates tribal interests, and whose values are not at odds with tribal values.

(B.) Historic Preservation Standards. Please include the following: "The Corps shall insure that the Tribes are provided with all draft reports prepared pursuant to this Programmatic Agreement, and that the Tribes will be offered the opportunity to review and comment on the reports. All comments by the Tribes shall be appropriately considered in the preparation of the final report."

III. PROJECT DESCRIPTION

(C.) Project Phasing and Potential Changes to the APE. Please note our request under definition of the APE above, and include throughout this document as necessary.

IV. INVENTORY OF HISTORIC PROPERTIES

(C.) Changes to the APE. Please note our request under the definition of APE above.

V. TREATMENT OF EFFECTS

(A.) Historic Property Treatment Plans. The Tribes wish to be included in the review and comment of HPTPs that involve resources of value to the Native American community. The PA says that concurring parties <u>may</u> be distributed to the Tribes as concurring parties. We request that this word be changed to "shall".

Review Schedule. The Tribes should be included in the 30-day review period.

(C.) Final Report. The Tribes should be offered the draft report and an opportunity to review and comment. A copy of the revised final report shall be provided to the Tribes.

VI. NATIVE AMERICANS AND OTHER PUBLIC CONSULTATION AND PUBLIC NOTICE

The Tribes are not members of the public for purposes of consultation, and should be afforded their full role as specified in the 2001 Final Rule of 36 CFR 800 and the intent within the 1999 revisions to Section 106 of the National Historic Preservation Act.

IX. AMENDMENTS

Please include the concurring parties at the table for amendments if the Project has not been completed within five years.

Concurring Parties Signature Page. The Tribes should be individually listed and afforded a place for signature on page 10 of 10.

We hope that receipt of this letter will result in a consultation to resolve many of our questions regarding the treatment of historic and culturally significant finds along the Natomas River.

Sincerely,

THE SHINGLE SPRINGS BAND OF MIWOK INDIANS

By: John Tayaba, Tribal Vice Chair

REPLY TO
ATTENTION OF

Executive Office

JUN 1 1 2008

Mr. John Tayaba, Tribal Vice Chair
Shingle Springs Rancheria
Post Office Box 1340
Shingle Springs, California 95682

Dear Vice Chair Tayaba:

I am responding to your May 8, 2008, letter requesting that the Shingle Springs Band of Miwok Indians (The Band) be treated by the U.S. Army Corps of Engineers (Corps) as a "consulting party" for the National Historic Preservation Act (NHPA) Programmatic Agreement (PA) for the Natomas Levee Improvement Program, Landside Improvements Project (NLIP).

Your correspondence indicates you have three primary areas of concern. First, you notified the Corps that The Band is designated as the Most Likely Descendant (MLD) by the Native American Heritage Commission, for certain actions involving the NLIP. Second, requested we investigate the actions of EDAW, a consulting firm to the Sacramento Area Flood Control Agency (SAFCA), regarding its treatment of Native American remains during recent field investigations at the site identified as CA-Sac-485/H. Lastly, you requested to be treated as a consulting party on the NLIP PA and provided substantive comments for our consideration.

We appreciate your desire to be fully engaged with all aspects of the PA. Please find enclosed a copy of the executed PA, dated May 1, 2008. As an alternative to amending the completed PA, the Corps would like invite you to consult on the creation of the Historic Properties Treatment Plan (HPTP). It is our belief that the concerns you expressed in your May 8 correspondence can be adequately addressed in the HPTP. Additionally, upon receipt of your letter the Corps, initiated an inquiry into EDAW's actions, and will share the results of this effort with you as soon as we can meet. While the Corps does not have the authority to direct the activities of EDAW or SAFCA, it has been in close contact with both entities and has recommended EDAW, who is acting through SAFCA, review its MLD procedures with the Native American Heritage Commission. That said, we understand controlled investigations/excavations may be continuing, by-way-of field consultations with input from one of the Band's representatives, as a standard operating procedure. Further, EDAW and SAFCA have assured the Corps that every effort is being made to address the Band's concerns and that they will continue to do so.

The Corps acknowledges that the Shingle Springs Band of Miwok Indians is a federally recognized tribe and desire to meet with you and/or your staff as soon as practicable. In preparation for our meeting, please let me know if I have not fully captured your concerns and if there are any other concerns which we may prepare to address.

Mr. Mark Gilfillan is the District's Tribal Liaison and point of contact for all Sacramento District and Tribal Nation consultations and concerns. Mr. Gilfillan will soon be in contact with you or your designated staff to facilitate and arrange our meeting with dates amenable to The Band. If you have any questions regarding our meeting, please contact Mr. Gilfillan at our Colorado West Regulatory Branch, 400 Rood Avenue, Room 142, email address *mark.a.gilfillan@usace.army.mil*, or telephone (970) 243-1199, extension 15. I look forward to our meeting and addressing your concerns.

Sincerely,

Original Signed

Thomas C. Chapman, P.E.

Sacramento
Area Flood
Control
Agency

June 12, 2008

Mr. John Tayaba

Tribal Vice Chair
Shingle Springs Rancheria
P.O. Box 1340
Shingle Springs, CA
95682

Dear Mr. Tayaba:

RE: Your letter of May 08, 2008 and our meeting on June 04, 2008.

On behalf of the Sacramento Area Flood Control Agency (SAFCA) we wish to thank you for the opportunity to meet in person last week in the office of the Native American Heritage Commission. This letter is in response to the concerns raised in your letter of May 8, 2008 and at our meeting on June 4th regarding the treatment of historic properties that could be affected by the Natomas Levee Improvement Program (Program). This urgently needed Program will address identified deficiencies in the levee system protecting the Natomas Basin and will provide the 80,000 residents of the basin with a high level of protection against potentially catastrophic flooding.

SAFCA values the input of the Shingle Springs Band of Miwok Indians (Band) as we make important decisions about the management of historic properties that could be affected by the Program. We recognize that the Band has a significant role in determining the treatment of historic properties as a consulting party under Section 106 of the National Historic Preservation Act, in addition to your role as the most likely descendant (MLD) under California Public Resources Code Section 5097.98. It is our intention to make every effort to incorporate your input and be responsive to your concerns as we move forward with the Program in a timely fashion. This letter provides a brief discussion of three items of critical concern, and then addresses other issues raised in your letter and at our meeting.

Future Steps for 106 Consultations

The Corps, SAFCA, and the California State Historic Preservation Officer (SHPO) have executed a programmatic agreement (PA) that governs treatment of significant cultural resources that may be affected by the Program. The PA requires consultation with the public and Native American individuals and

Office: 916.874.7606
FAX: 916.874.8289

Mail: 1007 7th Street, 7th Floor
Sacramento, CA 95814-3017

organizations (Stipulation VI). We expect to collaborate closely with you as the MLD on behalf of the Band in determining how cultural resources are managed for the Program. For each phase of construction (2008, 2009, 2010) we will consult with you regarding the area of potential effects, the inventory of historic properties, and the management of potentially adverse effects under historic property treatment plans.

Excavation of Skeletal Remains at CA-SAC-485/H

SAFCA's consultant, EDAW, is conducting ongoing excavations at CA-SAC-485/H. This site contains burial features and skeletal remains. In accordance with State law, EDAW contacted the Native American Heritage Commission (NAHC) in early March 2008, during the 2008 season of fieldwork, when human remains were encountered during archaeological excavations needed for compliance with Section 106. The NAHC assigned you as MLD on April 15, 2008. To enlist your input and ensure appropriate treatment of human remains, our Consultant has provided the Band (email of May 21, 2008) with proposed field protocols for dealing with cultural resources and a draft burial treatment plan. The Band's review and comment on these documents would be greatly appreciated.

In your May 8th letter you indicate that the burial site may have been inappropriately excavated, and the treatment of the site may not comply with Federal and State law. We are not presently aware of any violation of federal or state law, including your right to determine disposition of human remains under Section 5097.98 of the California Public Resources Code. However, we will conduct an impartial investigation of events at CA-SAC-485/H to determine if the previous activities at the site were in compliance with State and Federal laws as well as standard protocols for site investigation. We will follow up with you as this process moves forward.

Independent Peer Review

As part of our effort to ensure sufficient and appropriate identification and treatment of cultural resources, we are prepared to provide an ethnographer for assistance in the identification process and to retaining consultants acceptable to the Band to conduct an external peer review of EDAW's ongoing efforts and strategy. We have identified Far Western Anthropological Research Group as a firm with regional expertise in archaeology and geomorphology. However, as discussed at the June 4th meeting, we would welcome any alternative suggestions you may have regarding a qualified ethnographer and a firm to conduct the peer review.

Other Concerns

1. Definition of Historic Properties

The Band notes that it is appropriate to include traditional cultural places (TCPs) in the definition of historic properties. Eligible and National Register of Historic Places (NRHP) listed TCPs are included in the definition of historic properties in the implementing regulations, and are included in our definitions by reference to the regulations in the PA.

2. Ongoing Communication & MLD Liaison

SAFCA would appreciate your clarification regarding how SAFCA and its consultants should communicate with the MLD, the Band and its representatives. A clear definition of contacts and their specific roles will help us meet your expectations and facilitate cooperation as the project moves forward.

3. Modified Construction Methods

As discussed at our June 4th meeting SAFCA's engineering staff are developing a series of modifications to standard construction methods proposed for sensitive historic properties. We will be circulating a memo identifying these methods and hope to discuss them with you when we meet again. As the Band offered during the meeting, SAFCA would appreciate receiving the results of the cultural resources 'damage' study that was prepared for an undisclosed site. This study should assist us as we develop our modified construction methods.

4. Final Report

SAFCA will forward a copy of the draft final report(s) to be prepared per Stipulation V(C) of the PA and will consider the Band's comments in making final revisions to that document.

Summary

SAFCA seeks to accomplish the Program in a manner which is respectful and sensitive to Native American heritage. We appreciate your input and welcome your continued assistance in implementing the PA and managing historic properties associated with this important Program. We also look forward to hosting you on a Program field trip at a mutually convenient time. Please contact Peter Buck at 916-874-4581 if you have any questions or need further information, and please coordinate with him by phone or e-mail regarding when you are available to meet with the PA signatories.

Sincerely yours,

Stein M. Buer

SAFCA
Sacramento
Area Flood
Control
Agency

July 23, 2008

Janis Offermann
Senior Environmental Planner
Department of Water Resources
Division of Environmental Services
Environmental Compliance and Evaluation Branch
1725 23rd Street, Suite 220
Sacramento, CA 95816

Dear Ms. Offermann:

The Sacramento Area Flood Control Agency (SAFCA) is constructing the Natomas Levee Improvement Program (NLIP), Landside Improvements Project. This project will provide necessary improvements to the levee system that surrounds the Natomas Basin, including portions of Sutter County, Sacramento County and the City of Sacramento, California. This project requires permits and authorization from the U.S. Army Corps of Engineers (Corps) to discharge fill to waters of the United States and to modify federal flood control structures. These federal actions require that the Corps comply with Section 106 of the National Historic Preservation Act (NHPA).

Section 106 mandates that federal agencies consider the effects of their undertakings on historic properties and allow the Advisory Council on Historic Preservation (ACHP) a reasonable time to comment on the action. Historic properties are cultural resources such as archaeological sites, historic buildings and objects, and traditional cultural places that are listed on, or are eligible for listing on, the National Register of Historic Places (NRHP).

Compliance with Section 106, as defined in Part 800 of Title 36 of the Code of Federal Regulations (CFR), normally requires five sequential steps:

- determination of the area in which the undertaking may affect historic properties (also referred to as the area of potential effects or "APE")
- identification of cultural resources within the APE
- evaluation of those resources for listing on the NRHP
- identification of adverse effects on NRHP-eligible resources that would result from the undertaking
- and resolution of adverse effects

The Section 106 process also requires the federal agency to consult with the public, Indian Tribes, and the State Historic Preservation Officer (SHPO) during the identification and evaluation of historic properties and to consider ways to minimize adverse effects of the undertaking on those properties. These steps may occur

Office 916-874-7606
FAX 916-874-8289

1007 - 7th Street, 7th Floor
Sacramento, CA 95814-3407

sequentially as the federal agency consults with these parties in the context of routine federal undertakings. For complex undertakings such as the NLIP, however, the Section 106 regulations provide alternate pathways to Section 106 compliance. Agencies may perform phased identification, evaluation, and resolution of adverse effects as an undertaking proceeds, per 36 CFR Part 800.4(b)(2). This section allows a phased management of resources if a specific process is defined in an agreement document such as a programmatic agreement (PA) or memorandum of agreement (MOA).

The Corps, in consultation with SAFCA and the California SHPO, has developed a PA for the NLIP detailing a phased identification, evaluation, and treatment process for this undertaking (a copy of the executed PA is attached for your information and use). This stepwise process will track the phases of project construction during 2008, 2009 and 2010. This phasing is necessary because the Corps must issue separate authorizations and permits under the Rivers and Harbor Act and the Clean Water Act for each year of work. The geographic scale of the construction involved and uncertainty about the exact nature of work for future phases also dictates that the inventory, evaluation, and treatment of historic properties be developed as phases of the NLIP proceed. These circumstances require that historic properties are identified and managed separately for each year of planned project construction. The PA provides for the following steps to comply with Section 106:

- Inventory of historic properties prior to each year of construction, and submission to the Corps and SHPO of an inventory report and APE map for each year (Stipulation III[C], Stipulation IV). This document will evaluate identified resources and make a finding of effects based on the potential of the undertaking to result in adverse effects.
- Resolution of adverse effects by preparation of a historic properties treatment plan for each adversely affected property (Stipulation V[A]).
- Consultation with the public at large and Native American individuals and organizations with cultural ties to the APE.

In summary, SAFCA and the Corps will identify and manage historic properties in phases related to construction activities over the next few years. We understand that this undertaking has the potential to effect historic properties with noteworthy values to both the archaeological and Native American communities. Such resources include CA-SAC-485/H, the remains of a prehistoric site containing numerous features and Native American burials. The full list of potentially affected resources that have been identified within the project area is provided in the Draft Environmental Impact Report (SAFCA, 2007) prepared for the project. We are currently conducting additional archaeological inventory for the 2008 construction season and additional site evaluation efforts are needed for the planned 2009 construction season.

We are contacting you to fulfill the consultation requirements under the PA and to provide you with the opportunity to consult regarding substantive decisions about how to resolve adverse effects on historic properties. This consultation replaces the general

requirement for public and Native American consultation under the Section 106 regulations because the PA replaces these regulations, in part, for these undertakings. A key part of the consultation process is to provide notice and opportunity to participate in the decision making process to determine how adverse effects will be resolved. We are preparing a draft historic property treatment plan to manage potential adverse effects on CA-SAC-485/H. If you would like to review this document please contact our office to be placed on the distribution list. We are also consulting with the Most Likely Descendant designated for CA-SAC-485/H, Mr. John Tayaba of the Shingle Springs Band of Miwok Indians, as required under state law.

Please contact Peter Buck of SAFCA, at 916-874-4581 or buckp@saccounty.net should you have questions or need further information regarding the identification or treatment of historic properties for this undertaking.

Sincerely,

John A. Bassett
Director of Engineering
Design Construction Maintenance

Input Data

[1] Culvert Removal

Import/ Export	Qty (CY)	# of Haul Loads	Round-trip (miles)	Total Miles	Total Miles/day
--	-	-	4.00	120.00	8
			Activity Period (days) =	15.0	

*Assumes haul load is approximately 4 miles roundtrip

*Assumes that haul truck travel occurs on 50% paved and 50% unpaved haul routes

Notes:

1. Emission factor represents running exhaust (grams/mile)
2. Emission factor represents start emission rate @ 480 minutes (grams/trip)

[2] Detention Basin Area Stripping

Import/ Export	Qty (CY)	# of Haul Loads	Round-trip (miles)	Total Miles	Total Miles/day
-	-	-	1.00	20.00	4
			Activity Period (days) =	5.0	

*Assumes scrapers travel 100% on unpaved road

[3] Detention Basin Excavation (follows no. 2) - Work conducted in 10-hr shifts, 6 days per week

Import/ Export	Qty (CY)	# of Haul Loads	Round-trip (miles)	Total Miles	Total Miles/day
Excavation	4,750.00	339.29	4.00	1357.14	45.24
Backfill	5,875.00	419.64	4.00	1678.57	55.95
Material	**Tons/CY**	**Tons/day**			
	1.25	**442.7**			
			Activity Period (days) =	30.0	
			Haul Truck capacity (CY) =	14.0	

*Assumes haul load is approximately 4 miles roundtrip

*Assumes that material hauling is along 50% paved and 50% unpaved haul routes

[4] Demobilization/cleanup (follows no. 3)

Import/ Export	Qty (CY)	# of Haul Loads	Round-trip (miles)	Total Miles	Total Miles/day
-	-	-	4.00	96.00	8.00
			Activity Period (days) =	12.0	

*Assumes haul load is approximately 4 miles roundtrip

*Assumes that haul truck travel occurs on 50% paved and 50% unpaved haul routes

Notes:

1. Emission factor represents running exhaust (grams/mile)
2. Emission factor represents start emission rate @ 480 minutes (grams/trip)

Reaches 16-19A*

Activity Period (days)* =	140.0
Haul Truck capacity (CY) =	14.0
Truck Trips (trips/day)* =	540

*Assumes quantity of material is based on given # of trips per day times haul capacity times activity period (540 trips/day*14 cy*140 days); total fill material for Reaches 16-20 = 1,168,000 cy
*Assumes haul load is approximately 4 miles roundtrip
*Assumes that haul truck travel occurs on 50% paved and 50% unpaved haul routes
*Date provided by HDR One Company, Inc.
**Commercial Source; approximately 60 miles round trip
**Assumes 50% of aggregate material hauled in 16-19A and 50% hauled in 19B-20
Notes:
1. Emission factor represents running exhaust (grams/mile)

Input Data

[1] Site Preparation

Import/ Export	Qty (CY)	# of Haul Loads	Round-trip (miles)	Total Miles	Total Miles/day
-	-	-	4	200	20
Activity Period (days) =				10.0	

*Assumes haul load is approximately 4 miles roundtrip

*Assumes that haul truck travel occurs on 50% paved and 50% unpaved haul routes

[2] Borrow Site Preparation (Concurrent with 1)

Import/ Export	Qty (CY)	# of Haul Loads	Round-trip (miles)	Total Miles	Total Miles/day
-	-	-	4	86	4
Activity Period (days) =				20.0	

*Assumes haul load is approximately 4 miles roundtrip

*Assumes that haul truck travel occurs on 50% paved and 50% unpaved haul routes

[3] Working Surface Construction (Follows 2)

Import/ Export	Qty (CY)	# of Haul Loads	Round-trip (miles)	Total Miles	Total Miles/day
-	-	-	4	86	4
Activity Period (days) =				20.0	

*Assumes haul load is approximately 4 miles roundtrip

*Assumes that haul truck travel occurs on 50% paved and 50% unpaved haul routes

[4] Cutoff Wall Construction (Follows 3) (24 hours per day, 7 days per week)

Adjacent Levee Option

Import/ Export	Qty (CY)	# of Haul Loads	Round-trip (miles)	Total Miles	Total Miles/day
Borrow Site Excavation	965000	68929	4.00	275,714	3244
Material	**Tons/CY**	**Tons/day**			
--	**1.25**	**14191.2**			
Activity Period (days) =				85.0	
Haul Truck capacity (CY) =				14.0	

*Adjacent levee option represents the worst-case emissions scenario; proposed alternate options would result in lessor emissions

*Assumes haul load=14 yd^3

*Assumes haul load is approximately 4 miles roundtrip

*Assumes that haul truck travel occurs on 50% paved and 50% unpaved haul routes

1. Emission factor represents running exhaust (grams/mile)

2. Emission factor represents start emission rate @ 480 minutes (grams/trip)

3. Pickup truck/water truck use is assumed to be half of the work day (~12 hours of use); emission factor times 1.5 to represent 12 hours of operation/day

[5] Levee Raising/Widening (lags no. 4 by 21 days)

Adjacent Levee Option

Import/ Export	Qty (CY)	# of Haul Loads	Round-trip (miles)	Total Miles	Total Miles/day
Levee Embankment Degrade	0	0	4	0	0
Levee Embankment Fill	965000	68929	4	275714	3063
Class 2 Aggregate Surfacing	21600	1543	4	6171	69
Total	**986600**	**70471**	**12**	**281886**	**3132**
Material	**Tons/CY**	**Tons/day**			
--	**1.25**	**13702.8**			
Activity Period (days) =				90.0	
Haul Truck capacity (CY) =				14.0	

*Adjacent levee option represents the worst-case emissions scenario; proposed alternate options would result in lessor emissions

*Assumes haul load=14 yd^3

*Assumes haul load is approximately 4 miles roundtrip

			Activity Period (days) =	10.0	

*Assumes that haul truck travel occurs on 50% paved and 50% unpaved haul routes

[2] Cutoff Wall Installation - Southbound Lanes (follows no. 1) - Activity occurs 24 hours per day, 7 days per week

Import/ Export	Qty (CY)	# of Haul Loads	Round-trip (miles)	Total Miles	Total Miles/day
Reinforced Concrete	25.00	2	0.18	0.32	0.05
Aggregate Base Rock**	500.00	36	60.00	2,142.86	357.14
Total =	**525.00**	**37.50**	**60.18**	**2,143.18**	**357.20**
Material	**Tons/CY**	**Tons/day**			
--	**1.25**	**109.4**			
			Activity Period (days) =	6.0	
			Haul Truck capacity (CY) =	14.0	

1. Assumes 10% of VMT occur on unpaved roads; 90% of VMT occurs during material transport to and from commercial location.

*Assumes haul load=14 yd^3

*Assumes 50% of material used in No. 2 and 50% used in No. 4

**Aggregate material would come from commercial source up to 30 miles away

[3] Traffic Bypass Reconfiguration (follows no. 2) - Work conducted in 10-hr shifts, 6 days per week

Import/ Export	Qty (CY)	# of Haul Loads	Round-trip (miles)	Total Miles	Total Miles/day
Asphalt Concrete Paving	800.00	57	0.18	10.29	1.03
Material	**Tons/CY**	**Tons/day**			
	1.25	**100.0**			
			Activity Period (days) =	10.0	
			Haul Truck capacity (CY) =	14.0	

*Assumes haul load=14 yd^3

*Assumes that material hauling occurs on 50% paved and 50% unpaved haul routes

[4] Cutoff Wall Installation - Northbound Lanes (follows no. 3) (Activity occurs 24 hours per day, 7 days per week)

Import/ Export	Qty (CY)	# of Haul Loads	Round-trip (miles)	Total Miles	Total Miles/day
Reinforced Concrete	25.00	2	0	0.32	0.05
Aggregate Base Rock**	500.00	36	60	2,142.86	357.14
Total =	**525.00**	**37.50**	**60.18**	**2,143.18**	**357.20**
Material	**Tons/CY**	**Tons/day**			
--	**1.25**	**135.4**			
			Activity Period (days) =	6.0	
			Haul Truck capacity (CY) =	14.0	

1. Assumes 10% of VMT occur on unpaved roads; 90% of VMT occurs during material transport to and from commercial location.

*Assumes haul load=14 yd^3

*Assumes 50% of material used in No. 2 and 50% used in No. 4

**Aggregate material would come from commercial source up to 30 miles away

[5] Closure Structure Construction (follows no. 4)

Import/ Export	Qty (CY)	# of Haul Loads	Round-trip (miles)	Total Miles	Total Miles/day
-	-	-	0.18	10.80	0.36
			Activity Period (days) =	30.0	

*Assumes that haul truck travel occurs on 50% paved and 50% unpaved haul routes

Table 16: South Fisherman's Lake Borrow Area and West Lakeside School Site (ARNL/SREL) - Phase 4b Improvements

Project Information

Phase 4b South Fisherman's Lake Borrow Area and West Lakeside School Site includes excavation and rehabilitation of sites

Work Schedule: May - Nov, 2014

Total Borrow Site work length in Phase 4b =	1.0		mi		
	5280.0		ft		
Borrow Site length in Sacramento County =	5280.0		ft	**100.0%**	of the total length

1. Emission factor represents running exhaust (grams/mile)
2. Emission factor represents start emission rate @ 480 minutes (grams/trip)
3. Pickup truck use is assumed to be half of the work day (~12 hours of use); emission factor times 1.5 to represent 12 hours of operation/day

[5] Reconstruct Garden Hwy at one intersection (concurrent with 5 and 6)

1. Control efficiencies are based on implemented control measures, per SMAQMD CEQA Guidance: control efficiency for NOx emissions is based on enhanced exhaust control measures per SMAQMD CEQA Guidance, including submittal of contracted construction fleet inventories for demonstration of 20% control compared to the ARB fleetwide average, with an additional 20% reduction imposed by the project to meet general conformity thresholds. A total NOx reduction of 40% from state-wide fleet averages will be required for years 2010 forward for all project phases. The control efficiency of 85-90% for PM10/PM2.5 is based on implementation of enhanced dust control measures through implementation of a developed Fugitive Dust Control Plan; control efficiency of ROG is based on compliance with SMAQMD Rule 442 Architectural Coatings.

2. Emissions from Phase 3 were included in the Phase 3 FEIS, and were approved through the authorization of the Record of Decisions (ROD), prior to the conformity limit change from 50 TPY top 25 TPY. Therefore, 50 TPY is the correct General Conformity Threshold applicable to Phase 3 emissions of VOCs and NOx.

Particulate Matter Emissions
COMB = Combustion Emissions
EM = Earthmoving

Table 22: Phase 4b - SMAQMD Offset Mitigation Fee Summary

1. For both residential and non-residential acreage entries EXCLUDE ONLY undisturbed (not graded) Open Space.
2. Append this calculation sheet to the environmental document.
3. Unmitigated NOx (lbs/day) and duration (days) should be consistent with URBEMIS results.

Construction Emissons Mitigation Fee Calculation

PART 1: PROJECT INFORMATION

Project Name: SAFCA - Phase 4b - 2011 NLIP Construction Emissions within SMAQMD's Jurisdiction

PART 2: EMISSIONS INFORMATION

Year	Activity Phase	NOx (lbs/day) unmitigated	NOx (lbs/day) mitigated*	NOx over threshold (lbs/day)	duration (days)	Total significant NOx (lbs)
2012	ARNL Reaches 1-4	144.01	86.41	1.41	27	38.04
	Total project Nox over threshold (lbs)		*38.04*			
	Total project Nox over threshold (tons)		*0.02*			

PART 3: MITIGATION FEE RESULTS

TOTAL MITIGATION FEE ($16,400/TON)**	***$312***
Administrative Fee (5%)	***$16***
TOTAL MITIGATION FEE	***$328***

>>> *Fee is to be paid to the SMAQMD prior to any ground disturbance either in total or on a by acre basis.*

* Assumes a construction mitigation plan which achieves a 40% reduction in NOx from on-site, off-road equipment.
** Or the $/ton of NOx cost-effectiveness value in effect at the time the fee is collected.

PART 2: EMISSIONS INFORMATION

Year	Activity Phase	NOx (lbs/day) unmitigated	NOx (lbs/day) mitigated*	NOx over threshold (lbs/day)	duration (days)	Total significant NOx (lbs)
2013	ARNL Reaches 1-4	169.34	101.60	16.60	60	996.20
2013	West Drainage Canal	37.86	22.72	22.72	28	636.16
2013	City of Sacramento Pumps	80.36	48.21	48.21	40	1928.40
2013	SREL Reaches 16-20 - Initial 50%	374.91	224.95	224.95	30	6748.50
2013	**Total Activities =**					**10309.26**
	Total project Nox over threshold (lbs)		*10309.26*			
	Total project Nox over threshold (tons)		*5.15*			

PART 3: MITIGATION FEE RESULTS

TOTAL MITIGATION FEE ($16,400/TON)**	***$84,536***
Administrative Fee (5%)	***$4,227***
TOTAL MITIGATION FEE	***$88,763***

>>> *Fee is to be paid to the SMAQMD prior to any ground disturbance either in total or on a by acre basis.*

* Assumes a construction mitigation plan which achieves a 40% reduction in NOx from on-site, off-road equipment.
** Or the $/ton of NOx cost-effectiveness value in effect at the time the fee is collected.

PART 2: EMISSIONS INFORMATION

Year	Activity Phase	NOx (lbs/day) unmitigated	NOx (lbs/day) mitigated*	NOx over threshold (lbs/day)	duration (days)	Total significant NOx (lbs)
2014	SREL Reaches 16-20 - Remaining 50%	374.91	224.95	139.95	30	4198.35
2014	Lakeside School Borrow Site	29.47	17.68	17.68	140	2475.58
2014	**Total Activities =**					**6673.94**
	Total project Nox over threshold (lbs)		*6673.94*			
	Total project Nox over threshold (tons)		*3.34*			

PART 3: MITIGATION FEE RESULTS

TOTAL MITIGATION FEE ($16,400/TON)**	***$54,726***
Administrative Fee (5%)	***$2,736***
TOTAL MITIGATION FEE	***$57,463***

>>> *Fee is to be paid to the SMAQMD prior to any ground disturbance either in total or on a by acre basis.*

* Assumes a construction mitigation plan which achieves a 40% reduction in NOx from on-site, off-road equipment.
** Or the $/ton of NOx cost-effectiveness value in effect at the time the fee is collected.

PART 2: EMISSIONS INFORMATION

Year	Activity Phase	NOx (lbs/day) unmitigated	NOx (lbs/day) mitigated*	NOx over threshold (lbs/day)	duration (days)	Total significant NOx (lbs)
2015	District 1000 Pumping Plants	80.36	48.21	48.21	120	5785.70
2015	NEMDC South - Levee Raise	482.84	289.70	204.70	14	2917.04
2015	NEMDC South - Waterside	19.69	11.81	11.81	14	168.70
2015	**Total Activities =**					**8871.45**
	Total project Nox over threshold (lbs)		*8871.45*			
	Total project Nox over threshold (tons)		*4.44*			

PART 3: MITIGATION FEE RESULTS

TOTAL MITIGATION FEE ($16,400/TON)**	***$72,746***

Table 22: Phase 4b - SMAQMD Offset Mitigation Fee Summary

Administrative Fee (5%)	***$3,637***

	24-hour	–		35 µg/m^3		
Lead	30-day Average	1.5 µg/m^3	A	–	–	A
	Calendar Quarter	–	–	1.5 µg/m^3	Same as Primary Standard	

Table 3.11-2
Ambient Air Quality Standards and Attainment Status Designations for Sutter and Sacramento Counties

Pollutant	Averaging Time	California		National Standards [1]		
		Standards [2,3]	Attainment Status [4]	Primary [3,5]	Secondary [3,6]	Attainment Status [7]
Sulfates	24-hour	25 µg/m^3	A	**No National Standards**		
Hydrogen Sulfide	1-hour	0.03 ppm (42 µg/m^3)	U			
Visibility-Reducing Particle Matter	8-hour	Extinction coefficient of 0.23 per kilometer—visibility of 10 miles or more (0.07—30 miles or more for Lake Tahoe) because of particles when the relative humidity is less than 70%.	U			

[1] National standards (other than ozone, PM, and those based on annual averages or annual arithmetic means) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration in a year, averaged over 3 years, is equal to or less than the standard. The PM_{10} 24-hour standard is attained when 99% of the daily concentrations, averaged over 3 years, are equal to or less than the standard. The $PM_{2.5}$ 24-hour standard is attained when 98% of the daily concentrations, averaged over 3 years, are equal to or less than the standard. Contact the EPA for further clarification and current Federal policies.

[2] California standards for ozone, CO (except Lake Tahoe), SO_2 (1- and 24-hour), NO_2, PM, and visibility-reducing particles are values that are not to be exceeded. All others are not to be equaled or exceeded. California Ambient Air Quality Standards (CAAQS) are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

[3] Concentration expressed first in units in which it was promulgated (i.e., parts per million [ppm] or micrograms per cubic meter [µg/m^3]). Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

[4] Unclassified (U): a pollutant is designated unclassified if the data are incomplete and do not support a designation of attainment or nonattainment.
Attainment (A): a pollutant is designated attainment if the state standard for that pollutant was not violated at any site in the area during a 3-year period.
Nonattainment (N): a pollutant is designated nonattainment if there was a least one violation of a state standard for that pollutant in the area.
Nonattainment/Transitional (NT): is a subcategory of the nonattainment designation. An area is designated nonattainment/transitional to signify that the area is close to attaining the standard for that pollutant.

[5] National Primary Standards: The levels of air quality necessary, with an adequate margin of safety, to protect the public health.

[6] National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

[7] Nonattainment (N): any area that does not meet (or that contributes to ambient air quality in a nearby area that does not meet) the national primary or secondary ambient air quality standard for the pollutant.
Attainment (A): any area that meets the national primary or secondary ambient air quality standard for the pollutant.
Unclassifiable (U): any area that cannot be classified on the basis of available information as meeting or not meeting the national primary or secondary ambient air quality standard for the pollutant.

[8] This concentration effective May 17, 2006.

[9] The CAAQS were amended on February 22, 2007, to lower the 1-hour standard to 0.18 ppm and establish a new annual standard of 0.03 ppm. These changes become effective after regulatory changes are submitted and approved by the Office of Administrative Law, expected later this year.

[10] Because of a lack of evidence linking health problems to long-term exposure to coarse particle pollution, EPA revoked the annual PM_{10} standard on September 21, 2006.

Notes: Table entries in bold exceed thresholds.

C = combustion sources (construction equipment); EM = earthmoving activities; EPA = Environmental Protection Agency; FRAQMD = Feather River Air Quality Management District; lb/day = pounds per day; $\mu g/m^3$ = micrograms per cubic meter; NEMDC = Natomas East Main Drainage Canal; NCC = Natomas Cross Canal; NO_X = oxides of nitrogen; PM_{10} = respirable particulate matter with an aerodynamic diameter of 10 micrometers or less; PGCC = Pleasant Grove Creek Canal; ROG = reactive organic gases; SMAQMD = Sacramento Metropolitan Air Quality Management District

[1] FRAQMD does not have an adopted mass emission-based threshold for $PM_{2.5}$; implementation of the District-recommended Fugitive Dust Control Plan and additional control measures are presumed to assure compliance with the applicable SIP attainment goals.

[2] Implementation of all recommended standard mitigation measures listed under Mitigation Measure 4.11-a would reduce ROG, NO_X, and PM_{10} emissions by approximately 5%, ~~20~~40%, ~~75~~85% ~~95~~90% for fugitive PM_{10} emissions from earthmoving activities, and 45% for mobile-source PM_{10} emissions, respectively.

[3] Coordination of an emissions reduction agreement with the FRAQMD for calculation and fee payment by the project proponent(s) to FRAQMD prior to project approval would be used to offset emissions in excess of FRAQMD's significance thresholds for daily NO_X emission resulting in a less-than-significant impact.

See **Appendix F** for assumptions and modeling results for each activity and subphase (i.e., site preparation, cutoff wall installation, levee construction).

Significant with Mitigation Incorporated?	-	No[5]	No[4]		-		-	No[5]	No[4]		-		-	No[5]	No[4]		-		-	No[5]	No[4]		-		-	No[5]	No[4]		-	

Notes: Table entries in bold exceed thresholds.
C = combustion sources; EM = earthmoving activities; EPA = Environmental Protection Agency; FRAQMD = Feather River Air Quality Management District; lb/day = pounds per day; $\mu g/m^3$ = micrograms per cubic meter; NEMDC = Natomas East Main Drainage Canal; NCC = Natomas Cross Canal; NO_X = oxides of nitrogen; PM_{10} = respirable particulate matter with an aerodynamic diameter of 10 micrometers or less; PGCC = Pleasant Grove Creek Canal; ROG = reactive organic gases; SMAQMD = Sacramento Metropolitan Air Quality Management District

[1] Earthmoving activities during Sacramento River east levee Reaches 13–15 include excavation of borrow sites and movement of levee fill material totaling approximately 1.3 million cubic yards.

[2] Earthmoving activities during Riverside Canal relocation include excavation of borrow site material totaling approximately 410,000 cubic yards.

[3] Implementation of all recommended standard mitigation measures listed under Mitigation Measure 4.11-a would reduce ROG, NOX, and PM10 emissions by approximately 5%, ~~20~~40%, ~~75~~85% ~~95~~90% for fugitive PM10 emissions from earthmoving activities, and 45% for mobile-source PM10 emissions, respectively.

[4] SMAQMD does not have an adopted mass emission-based threshold for PM10. However, in absence of a localized threshold, emissions are compared against concentration based Ambient Air Quality Standards (AAQS); PM10 24-hr standard = 50 µg/m3; SMAQMD's CEQA Guide allows for enhanced PM10 Dust Control Practices to be proposed and implemented at the proposed project site for quantifiable emissions reductions. The proposed Phase 4b Project has developed a comprehensive Fugitive Dust Control Plan in compliance with the guidelines that will effectively reduce mass PM10 emissions below the concentration based thresholds.

[5] Payment into SMAQMD's Off-site Construction Mitigation Fee Program to offset NO_X emissions in excess of SMAQMD's significance threshold would reduce impacts for this pollutant in SMAQMD's jurisdiction to a less-than-significant level.

See **Appendix F** for assumptions and modeling results for each activity and subphase (i.e., site preparation, cutoff wall installation, levee construction, etc.).

Table 4.11-3
Maximum Daily Emissions during the Peak (2013) Construction Season within Sacramento County for the Fix-in-Place Alternative[1]

Year	2013					
Pollutant	ROG	NO_X	PM_{10}		$PM_{2.5}$	
			Combustion	Earthmoving	Combustion	Earthmoving
Total unmitigated emissions (lb/day)	81.9	662.5	37.1	~~1203.9~~ 1,062.5	34.2	~~145.9~~ 125.3
SMAQMD Threshold[2]	**–**	**85**	-[3]		-[3]	
Significant?	**–**	**Yes**	-		-	
Total mitigated emissions (lb/day)[2]	77.8	~~530.0~~ 398.0	20.4	~~60.2~~ 159.3	18.8	~~7.3~~ 18.8
			~~80.6~~ 180.0		~~26.1~~ 37.6	
Significant with Mitigation Incorporated?	–	No[4]	-		-	

Notes: Table entries in bold exceed thresholds. EPA = Environmental Protection Agency; FRAQMD = Feather River Air Quality Management District; lb/day = pounds per day; $\mu g/m^3$ = micrograms per cubic meter; NCC = Natomas Cross Canal; NEMDC = Natomas East Main Drainage Canal; NO_X = oxides of nitrogen; PGCC = Pleasant Grove Creek Canal; PM_{10} = respirable particulate matter with an aerodynamic diameter of 10 micrometers or less; ROG = reactive organic gases; SMAQMD = Sacramento Metropolitan Air Quality Management District

[1] Peak daily emissions during the Fix-in-Place Alternative occur entirely within Sacramento County; no activities would occur in Sutter County during the 2013 construction season.

[2] Implementation of all recommended standard mitigation measures listed under Mitigation Measure 4.11-a would result in reductions of ROG, NO_X, and PM_{10} emissions by approximately 5% for ROG, ~~20~~40% for NO_X, ~~75~~85% ~~85~~90% for fugitive PM_{10} emissions, and 45% for mobile-source PM_{10} emissions.

[3] SMAQMD does not have an adopted mass emission-based threshold for PM_{10} or $PM_{2.5}$; the project proponent(s) have proposed Fugitive Dust Control Plan(s) and Enhanced Control Measures that will effectively reduce and maintain PM10 and PM2.5 emissions below the applied concentration based thresholds.

[4] Payment into SMAQMD's Off-site Construction Mitigation Fee Program to offset NO_X emissions in excess of SMAQMD's significance threshold would reduce impacts for this pollutant in SMAQMD's jurisdiction to a less-than-significant level.

See **Appendix F** for assumptions and modeling results for each activity and subphase (i.e., site preparation, cutoff wall installation, levee construction).

Front End Loader	76.0
Dozer	81.0

Combined Predicted Noise Level (L_{eq} dBA at 50 feet)
84.7

Sources:

[1] Obtained from the FHWA Roadway Construction Noise Model, January 2006.

[2] Based on the following from the Federal Transit Noise and Vibration Impact Assessment, 2006.

$L_{eq}(equip) = E.L.+10*\log(U.F.) - 20*\log(D/50) - 10*G*\log(D/50)$

Where: E.L. = Emission Level;

U.F.= Usage Factor;

G = Constant that accounts for topography and ground effects; and

D = Distance from source to receiver.

Haul Truck Trips
Sarcamento East Levee Reach A: 16-19A

Assumptions:

Mean SEL Reference Level at 50 feet	84.0
Assumed Haul Truck Speed (mph)	35.0
Number of Hours for Hauling per Day	10.0
Haul Truck Size in Cubic Yards	14.0
Amount of Haul Material	1,058,400
Number of Haul Days	140.0
Amount of Daily Haul Material	7,560.0
Amount of Hourly Haul Material	756.0
Number of Trips per Hour-one way	108.0
Leq for Haul Trips at 50 feet	66.4

Appendix G
Haul Truck Trips
Sacramento East Levee Reach A: 19B-20

Assumptions:

Mean SEL Reference Level at 50 feet	84.0
Assumed Haul Truck Speed (mph)	35.0
Number of Hours for Hauling per Day	10.0
Haul Truck Size in Cubic Yards	12.0
Amount of Haul Material	194,400.0
Number of Haul Days	45.0
Amount of Daily Haul Material	4,320.0
Amount of Hourly Haul Material	432.0
Number of Trips per Hour-one way	72.0
Leq for Haul Trips at 50 feet	64.6

Appendix G
Haul Truck Trips
American River North Levee Reach I: 1-4

Assumptions:

Mean SEL Reference Level at 50 feet	84.0
Assumed Haul Truck Speed (mph)	35.0
Number of Hours for Hauling per Day	10.0
Haul Truck Size in Cubic Yards	12.0
Amount of Haul Material	167,000.0
Number of Haul Days	140.0
Amount of Daily Haul Material	1,192.9
Amount of Hourly Haul Material	119.3
Number of Trips per Hour-one way	19.9
Leq for Haul Trips at 50 feet	59.1

Appendix G
Haul Truck Trips
West Levee of NEMDC Reaches F-G

Assumptions:

Mean SEL Reference Level at 50 feet	84.0
Assumed Haul Truck Speed (mph)	35.0
Number of Hours for Hauling per Day	10.0
Haul Truck Size in Cubic Yards	14.0
Amount of Haul Material	965,000.0
Number of Haul Days	140.0
Amount of Daily Haul Material	6,892.9
Amount of Hourly Haul Material	689.3
Number of Trips per Hour-one way	98.5
Leq for Haul Trips at 50 feet	66.0

Appendix G
Haul Truck Trips
West Levee of PGCC Reach E

Assumptions:

Mean SEL Reference Level at 50 feet	84.0
Assumed Haul Truck Speed (mph)	35.0
Number of Hours for Hauling per Day	10.0
Haul Truck Size in Cubic Yards	14.0
Amount of Haul Material	345,500.0
Number of Haul Days	140.0
Amount of Daily Haul Material	2,467.9
Amount of Hourly Haul Material	246.8
Number of Trips per Hour-one way	35.3
Leq for Haul Trips at 50 feet	61.5

APPENDIX I

Responses to Comments on the DEIS/DEIR

APPENDIX I
RESPONSES TO COMMENTS ON THE DEIS/DEIR

This appendix contains the comment letters received on the Phase 4b DEIS/DEIR, including transcribed comments received during the July 15, 2010 public hearing[1], and USACE's and SAFCA's individual responses to significant environmental issues raised in those comments. Each letter, as well as each individual comment within the letter, has been given a number for cross-referencing. Responses are sequenced to reflect the order of comments within each letter. **Table I-1** lists all parties who submitted comments on the Phase 4b DEIS/DEIR during the public review period.

Table I-1

Sacramento, CA 95814

Dear Ms. Holland:

The Department of the Interior has received and reviewed the DEIS for the American River Watershed Common Features Project/Natomas Post-Authorization Change Report/Natomas Levee Improvement Program, Phase 4b Landside Improvements Project in Sacramento and Sutter Counties, CA and has no comments to offer. F1-1

Thank you for the opportunity to review this project.

Sincerely,

Patricia Sanderson Port

Sacramento, California 95814-4706

AUG - 9 2010

Elizabeth Holland
Planning Division
U.S. Army Engineer, Sacramento District
1325 J Street
Sacramento, California 95814

Dear Elizabeth Holland:

This is in response to your June 30, 2010, letter requesting technical assistance and comments from NOAA's National Marine Fisheries Service (NMFS) for the draft Environmental Impact Statement/Environmental Impact Report (EIS/EIR) on the American River Watershed Common Features Project/Natomas Levee Improvement Program (NLIP), Phase 4b Landside Improvements Project (Phase 4b Project) and the draft Natomas Post-authorization Change Report (Natomas PACR).

The draft EIS/EIR has been prepared by the US Army Corps of Engineers (Corps), Sacramento District and the Sacramento Area Flood Control Agency (SAFCA) in accordance with the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA). The Corps is the lead for NEPA compliance and SAFCA is the lead for CEQA compliance.

F2-1

The regional setting of the Phase 4b Project is the 53,000 acre Natomas Basin at the confluence of the American and Sacramento rivers. The project location includes parts of the City of Sacramento and portions of Sacramento and Sutter counties. The Natomas Basin is bordered by the American River to the south, the Sacramento River to the west, the Natomas Cross Canal (NCC) to the north, and the Pleasant Grove Creek Canal (PGCC) and Natomas East Main Drainage Canal (NEMDC) to the east. The Phase 4b Project involves levee construction on portions of all of these rivers and canals.

The NLIP addresses identified deficiencies in the Natomas Basin perimeter levee system. The main goal of the project is to reduce flood risk to the Natomas Basin and to bring the levee system up to at least a certified 100-year flood risk reduction under regulations adopted by the Federal Emergency Management Agency. Phases 1, 2, 3, and 4a of the NLIP should be completed by 2012. Phase 4b specifically addresses underseepage, stability, erosion,

penetration, and levee encroachments along approximately 3.4 miles of the Sacramento River, 1.8 miles of the American River, 6.8 miles of the NEMDC, 3.3 miles of the PGCC, and portions of the NCC. Assuming all funding, authorizations, environmental and other permits are in place, construction of the Phase 4b Project should begin in 2012 and be completed by 2016.

The Federal lead for the proposed project is the Corps, and the state lead is SAFCA. The Federal Aviation Administration is acting as a cooperating agency for NEPA. In addition to completing an EIS/EIR, the lead agencies will also be fulfilling requirements as for Section 10 and 14 of the Rivers and Harbors Act, Section 408, Section 404 of the Clean Water Act, and the Federal and state Endangered Species Acts.

In addition to the needs mentioned above, this EIS/EIR will be used to support Congressional approval of the Natomas PACR. If Congress does not authorize Corps to construct Phase 4b Project, SAFCA may choose to proceed without Federal participation and the EIS/EIR will be used to support Corp's decisions pursuant to Section 408, 404, and 10.

The Natomas PACR was prepared by the Corps as the result of a reevaluation study of the American River Common Features project that identified changes to the Natomas portion of the authorized project. The Federal sponsor for the reevaluation study is Corps and the state sponsor is the Central Valley Flood Protection Board (CVFPB). SAFCA has a cooperation agreement with CVFPB. The changes identified do not change the purpose of the project, but they do change the project scope, timeline, design, potential impacts, and cost.

F2-1
(Con't.)

NMFS has reviewed the information provided with your June 30, 2010, letter. As stated in the Executive Summary and Chapters 4 and 7 of the draft EIS/EIR, under Section 7, the Corps must consult with NMFS to ensure that the Phase 4b Project will not jeopardize endangered or threatened species, or destroy or adversely modify designated critical habitat, as designated by the Federal Endangered Species Act (ESA) of 1973, as amended (16 U.S.C. 1531 *et seq.*). If the proposed project "may affect" a listed species or critical habitat, the lead agency is required to prepare a biological assessment (BA). In response to the BA, NMFS will issue a biological opinion with a determination on the impacts of the proposed project on listed species and critical habitat. Additionally, the Magnuson-Stevens Fishery Conservation and Management Act requires all Federal agencies to consult with NMFS regarding all action or proposed actions that my adversely affect Essential Fish Habitat.

As the project progresses, it is anticipated that the project proponents will seek out consultation as required under ESA. Be advised that NMFS can only enter section 7 consultation with another Federal agency or its designee. Future section 7 consultation for the Phase 4b Project will involve possible effects of the proposed project on the Federally listed threatened Central Valley (CV) steelhead (*Oncorhynchus mykiss*), the threatened Southern distinct population segment of North American green sturgeon (*Acipenser medirostris*), endangered Sacramento River winter-run Chinook salmon (*O. tshawytscha*), and threatened CV spring-run Chinook salmon (*O. tshawytscha*) and their critical habitats.

Some comments on the draft EIS/EIR and the Natomas PACR (found below) are general in nature, others relate to specific language in the draft EIS/EIR and Natomas PACR, and some are editorial.

VEGETATION REMOVAL AND VARIANCE COMMENTS

Central Valley levee vegetation has significant ecosystem importance. Vegetation along many levees provides critical fishery habitat and is ecologically significant to numerous ESA listed and protected species. Protection and enhancement of the riparian corridors is necessary for the survival and recovery of the Sacramento River winter-run and CV spring-run Chinook salmon and CV Steelhead.

Section 4.7.2 emphasizes that the Phase 4b Project could result in a direct loss of levee waterside vegetation. NMFS recommends pursuing a variance pursuant to the Central Valley Flood System Improvement Framework (Framework). NMFS acknowledges that on pages 2-24, 2-30, page 2-36 the EIS/EIR discloses the intent that Phase 4b Project will pursue a vegetation variance to allow waterside vegetation to remain. The Framework describes that major modifications of existing levee section will comply with the Corps' levee vegetation standards, but may allow vegetation to remain if these projects can demonstrate that the public safety risks posed to levee integrity have been adequately addressed and engineered into project design. The Central Valley Flood Protection Plan will be completed in 2012 and will outline levee vegetation policies. In the meantime, there are guidelines available on how to handle vegetation on levees. Additionally, NMFS encourages the project proponent to include assurances that habitat creation and preservation that is mitigation for the Phase 4b Project be successfully implemented. F2-2

Despite the mention of a variance in the draft EIS/EIR, the Natomas PACR lacks mention of obtaining a vegetation variance for levee work. This seems inconsistent with the EIS/EIR and the existing Framework. NMFS recommends that the Final Natomas PACR include a section detailing the desire to obtain a variance or a detailed explanation as to why a variance is not included as part of the Natomas PACR.

STANDARDIZED ASSESSMENT METHODOLOGY (SAM) COMMENTS

Prior to and during the process of any construction as part of the Phase 4b Project that impact waterside vegetation, NMFS recommends that you use the standardized assessment methodology (SAM) to evaluate the response to habitat features affected by bank protection projects. SAM is a modeling and tracking tool developed by Stillwater Sciences and was originally used for Corps Sacramento River Bank Protection Project (SRBPP). The SAM evaluates bank protection alternatives affecting threatened and endangered fish species. By identifying and quantifying the response of fish species to habitat conditions over time, users can determine necessary measures to avoid, minimize, or fully compensate for fish impacts for various life stages. F2-3

SAM has been used at numerous levee sites along the mainstem Sacramento River and tributaries as part of the SRBPP. Modeling outcome revealed long-term habitat losses and demonstrated the need for commensurate compensation measures and habitat enhancement such as: installing in-stream wood material for habitat complexity, planting riparian vegetation to stabilize the bank, and provide a source of shade and cover for channel margin habitat.

SPECIFIC COMMENTS

Throughout the document it is stated that without the levee repairs and upgrades flood risk will continue. While NMFS agrees with this statement, it is important to note that even with the improvements that are a part of the proposed project, there will still be potential flooding and risk of levee failure in the project area; this should be clearly stated in the final EIS/EIR. F2-4

Note: Both documents should have been with line numbers to simplify the review process. F2-5

PHASE 4b EIS/EIR

XIX: NLAP and NALP are both defined as North Area Local Project. NALP is used on page ES-7. F2-6

Page ES-4: The following is stated, "Sutter and Sacramento Counties", should be "Sutter and Sacramento counties". F2-7

Page ES-7: No apparent explanation or definition of an AE zone. F2-8

Page 1-2: The Federal Interest section is confusing. The purpose of the project is to increase levee protection to at least the 100 year flood protection and to the 200 year in the future thus ultimately reducing flood risk and flood damage in the Natomas Basin. Why is this not the Federal Interest? F2-9

Page 1-24: Plate 1-5 mentions that "approximately 15 sites…" In looking at Plate 1-5, there are 15 sites labeled. Not sure the "approximately" is appropriate. F2-10

Page 2-7: In section 2.1.3.4 there are discussions involving vegetation on the levees. There is no mention of the California Central Valley Flood System Improvement Framework that was put together in 2009. This Framework is to be used as a guide for vegetation on levees until the Central Valley Flood Protection Plan is completed in 2012. F2-11

Pages 2-24, 2-30, and 2-36: In the waterside vegetation removal section there is no mention of what may happen if a variance is not granted? F2-12

Page 2-68: In section 2.3.4.10 there is a discussion of landside vegetation mitigation. This section should also include a discussion on waterside vegetation mitigation. F2-13

Page 3-1 and 3-43: Should be "American and Sacramento rivers" not "American and Sacramento Rivers" F2-14

Page 3-46: Last sentence has Pacific chorus frog and bullfrog listed as reptiles. F2-15

Page 4.7-8: In the Temporal Loss of Landside and Waterside Woodland Habitats section there is no mention of utilizing the current California Central Valley Flood System Improvement Framework that guides vegetation along levees. Realizing that construction related to Phase 4b F2-16

will not occur until 2012 or later, this is when the Central Valley Flood Protection Plan will completed and will provide guidance on levee vegetation issues. These guidance documents should be mentioned and cited in the text. F2-16 (Con't.)

Page 4.7-8: Towards the bottom of the page the following is stated, "if habitat creation/preservation is not effectively implemented, the long-term loss of woodlands (including Heritage oaks) would result in a **potentially significant** impact." There should be an explanation as to why there is potential for the habitat creation and preservation to not be effectively implemented. The project proponent should ensure that the habitat creation and preservation is effectively done. F2-17

Page 4.7-11: Utilization of the SAM should be mentioned as part of the Mitigation Measure 4.7-a. Prior to and during the process of any construction as part of Phase 4b Project that impacts waterside vegetation, NMFS recommends that you use the SAM to evaluate the response to habitat features affected by various construction activities. SAM has been used at numerous levee sites along the mainstem Sacramento River and tributaries. F2-18

POST-AUTHORIZATION CHANGE REPORT AND INTERIM GENERAL REEVALUATION REPORT

Page PAC-7: The paragraph starting with "The original project…" is confusing and has grammatical errors.

Page PAC-10: The term MCACES is used in footnote 1. There is no explanation or definition of MCACES. This term is also used later in the document with no explanation.

Page PAC-11: There is no explanation for Table 7 in the text.

Page 1-3: Under heading "d" there is a floating quotation sign.

Page 1-4 and throughout document: Under heading "a" the text reads "Sacramento and American Rivers". It should be "Sacramento and American rivers". Same logic applies where the text reads "Feather, Yuba and American Rivers", should be "Feather, Yuba and American rivers". Make appropriate edits throughout entire document. F2-19

Page 2-11: Table 2-1 should be described in the main text.

Page 2-14: The document should include that obtaining a variance to maintain the levee vegetation would satisfy requirements of the ETL. The document correctly identifies the Framework and that it will expire in 2012. However, the document should include a description on how in 2012 there will be a new levee guidance document as part of the Central Valley Flood Protection Plan.

Page 2-15: For consistency, "Floodplains" under heading (7) should be underlined.

Page 2-16: Table 2-3 should be described in the text.

Page 2-17: Table 2-4 should be described in the text.

Page 2-20: In section 2-5 Planning Constraints, Central Valley steelhead should be included in bullet number 2.

Pages 2-24, 2-25, and 2-26: Tables 2-7, 2-8, 2-9, and 2-10 are incorrectly numbered and not properly described in the text.

Page 2-27: Figure 7B-1 is cited twice. It is unclear what this figure is and where it is located.

Page 2-27: No explanation for the basis for using of three flood events as the threshold for people to abandon Natomas Basin.

Page 3-9: Under heading "e. Vegetation and Encroachments", the text should describe that a vegetation variance could be obtained to satisfy the levee requirements under the ETL. To state that "complete removal of vegetation…" is necessary to fulfill the ETL is false.

F2-19
(Con't.)

Page 3-15: Table 3-5 is not described in the text.

Page 3-19: The following is found in the text, "compliance with the vegetation ETL will require that vegetation is removed from the levee." This is false, obtaining a vegetation variance will also comply with the ETL and this should be discussed as a viable alternative.

Page 3-27: Table 3-14 fails to mention that obtaining a variance is another method of complying with the ETL.

Page 3-34. The second sentence in the first full paragraph is incomplete.

Page 4-35: In Table 4-8 under the State section, CEQA should be listed.

Page 4-42: In Table 4-9 under the NMFS agency row, the Permit/Authorization/Approval text appears to be incorrect.

Page 7-1: The term "I" is used to initiate Chapter 7. Confusing as to who or what the "I" is? The final document should clarify.

This documents NMFS comments on the Phase 4b Project draft EIS/EIR and the Natomas PACR. NMFS comments to the draft EIS/EIR and Natomas PACR are intended to help guide the development of the final EIS/EIR and future ESA consultations.

If you have any questions regarding this correspondence please contact Mike Hendrick by telephone at (916) 930-3605 or by e-mail at Michael.Hendrick@noaa.gov.

Sincerely,

Maria Rea
Central Valley Office Supervisor

F2-1 Comment noted.

F2-2 As stated in Section 2.1.3.4, "Management of Levee Vegetation and Structural Encroachments," under the subheading "Vegetation Variance Request" of the DEIS/DEIR, SAFCA and CVFPB sought a vegetation variance from the standard vegetation guidelines set forth in USACE's Engineering Technical Letter 1110-2-571. This section has been updated in the FEIS/FEIR to reflect the fact that USACE granted the variance request in June 2010, and vegetation will be allowed to remain on a portion of the waterside slope and berm of several of the levee segments comprising the perimeter levee system protecting the Natomas Basin, except the lower 1/3 of the slope of the Natomas East Main Drainage Canal (NEMDC) where trees must be removed to comply with USACE levee vegetation guidance. Discussion of the Central Valley Flood System Improvement Framework and the Central Valley Flood Protection Plan was also added to this section. It is SAFCA's and USACE's intent that the habitat creation and preservation that is part of the Phase 4b Project and/or part of the mitigation measures identified for the Phase 4b Project would be successfully implemented.

The aforementioned DEIS/DEIR text is revised as follows:

> During preparation of the DEIS/DEIR, SAFCA and the Central Valley Flood Protection Board (CVFPB), the non-Federal sponsors of the NLIP, ~~are requesting~~ requested a variance from the standard vegetation guidelines set forth in USACE's Engineering Technical Letter 1110-2-571 (USACE 2009a). The *CVFPB and SAFCA Vegetation Variance for the Common Features (Natomas Basin) Project, Post-Authorization Change Report* (also referred herein as "vegetation variance") was developed to comply with applicable provisions of the California Central Valley Flood System Improvement Framework that was adopted by the California Levees Roundtable on March 26, 2009 (Framework). The Framework specifically states that where, as in the case of the Phase 4b Project, major modifications of existing levee sections are required, such modifications:
>
> > …will comply with the [USACE] levee vegetation standards, but may allow vegetation to remain if these projects can demonstrate that the public safety risks posed to levee integrity have been adequately addressed and engineered into project designs.
>
> The Framework is to be used as a guide for vegetation on levees until the Central Valley Flood Protection Plan is completed in 2012.
>
> The vegetation variance request was granted by USACE in June 2010~~Under this variance~~, and vegetation will be allowed to remain on a portion of the waterside slope and berm of several of the levee segments comprising the perimeter levee system protecting the Natomas Basin, except the lower 1/3 of the slope of the NEMDC where trees must be removed to comply with USACE levee vegetation guidance. Although the variance was granted, this FEIS/FEIR retains the original scenarios presented in the DEIS/DEIR, which include both a with- and without-variance outcome to show the full range of potential adverse effects, including the worst-case scenario, as required under NEPA.

The following sections describe the levee segments that ~~would be~~ are covered by this variance. Sections 2.3, "Proposed Action," and 2.4, "Fix-in-Place Alternative," describe the vegetation removal assumptions used by this EIS/EIR to provide environmental analysis to support consideration of this variance request.

The Natomas Post-Authorization Change Report (PACR) has been updated to reflect approval of the *CVFPB and SAFCA Vegetation Variance for the Common Features (Natomas Basin) Project, Post-Authorization Change Report* (also referred herein as "vegetation variance"), and the approval memo has been added as Appendix I of the Natomas PACR.

F2-3 The commenter recommends that prior to and during the process of construction, as part of the Phase 4b Project components that would affect waterside vegetation, the project proponent(s) should use the Standard Assessment Methodology (SAM) to evaluate habitat features affected by bank protection projects. As stated in the comment, SAM is a modeling tool that evaluates bank protection alternatives affecting threatened and endangered fish species. By identifying the response of fish species to habitat conditions over time, SAM users can determine necessary measures to avoid, minimize, or fully compensate for fish impacts for various life stages.

The comment does not question the analysis or conclusions in the DEIS/DEIR, rather, it recommends the use of a particular methodology (namely, SAM) to analyze impacts to the waterside vegetation. Section 4.7, "Biological Resources," of the DEIS/DEIR analyzes potential impacts to waterside vegetation that could result from implementation of the Phase 4b Project (see Impact 4.7-a, "Loss of Landside and Waterside Woodland and Shaded Riverine Habitats"). The analysis includes two different scenarios for the Phase 4b Project, one that assumes implementation of USACE's levee encroachment policy without a vegetation variance and another that assumes the vegetation variance would be granted. See response to comment F2-2.

The analysis of impacts identified both temporal and long-term losses of landside and waterside woodlands. As described in Mitigation Measure 4.7-a, "Minimize Effects on Woodland Habitat; Implement Woodland Habitat Improvements and Management Agreements; Compensate for Loss of Habitat; and Comply with Section 7 of the Federal Endangered Species Act, Section 2081 of the California Endangered Species Act, and Section 1602 of the California Fish and Game Code," in the DEIS/DEIR, the project proponent(s) shall be required to further avoid and minimize potential impacts to the extent feasible, compensate for any tree/woodland removal on a no-net-loss basis, and obtain and comply with Section 7 of the Federal Endangered Species Act, Section 2081 of the California Endangered Species Act, and Section 1602 of the California Fish and Game Code. The analysis found that habitat improvements from mitigation implementation would reduce long-term impacts to waterside woodland habitats loss to a less-than-significant level; however, this impact would remain significant and unavoidable for many years before reaching a less-than-significant level because replacement plantings would require a minimum of 10–15 years before providing important habitat components such as shade and structure and decades to replace older, more mature trees.

Because the impacts to waterside vegetation are relatively small, localized, and have been avoided and/or minimized to a large extent; mitigation measures will ensure no net loss (in the long-term); and consultation with resource agencies, including the National Marine Fisheries Service (NMFS) is underway, the use of the SAM model is not necessary to quantify impacts and/or determine if mitigation is commensurate.

F2-4 Residual flood risk is discussed in Section 2.7, "Residual Risk of Flooding," of the DEIS/DEIR.

F2-5 Comment noted.

F2-6 "NALP" is correct. The "Acronyms and Abbreviations" section is revised as follows:

…

NHPA	National Historic Preservation Act
~~NLAP~~	~~North Area Local Project~~
NLIP	Natomas Levee Improvement Program

…

F2-7 The first paragraph in Section ES.6, "Project Background and Phasing," of the DEIS/DEIR is revised as follows:

> As stated above, the overall purpose of the multi-phase NLIP is to bring the entire 42-mile Natomas Basin perimeter levee system into compliance with applicable Federal and state standards for levees protecting urban areas. The Phase 4b Project is the final phase of the NLIP Landside Improvements Project, and consists of improvements to the remaining portions of the Natomas Basin's perimeter levee system in the City of Sacramento and in Sutter and Sacramento ~~Counties~~ counties, California, associated landscape and irrigation/drainage infrastructure modifications, and habitat creation and management.

F2-8 In the paragraph beginning, "In January 2008…" on page ES-7 of the DEIS/DEIR, the second sentence provides the definition for AE zone: "FEMA defines AE zones as areas with a 0.01 AEP of flooding."

F2-9 See Section 1.1.1.1, "Relationship between the Federal interest and the Locally Preferred Plan," of the Phase 4b DEIS/DEIR.

F2-10 The first paragraph under the subheading, "Riverbank Erosion," in Section 1.4.2.1, "Flood Problems and Needs," of the DEIS/DEIR is revised as follows:

> As shown in **Plate 1-5**, ~~approximately~~ 15 sites along the waterside of the Sacramento River east levee are subject to bank erosion in the form of bed or toe scour and wave wash that threatens the stability of the adjacent levee. Risk priorities have been assigned to the affected sites based primarily on the risk of slope failure due to undermining. High-risk sites exhibit one or more of the following characteristics and are considered potentially susceptible to failure in a 100-year flood event…

F2-11 It is recognized that the Framework was used to shape the vegetation variance process. A variance was obtained and is included in Appendix I of the Natomas PACR.

F2-12 The last sentence of the last paragraph of Section 2.3.3.2, "Waterside Vegetation Removal," of the DEIS/DEIR states that if the vegetation variance is not granted, vegetation with stem widths that have a diameter at breast height (dbh) greater than two inches would be cleared within 15 feet of the waterside levee toe. Table 4.7-2 in the DEIS/DEIR shows the estimated acreages of vegetation that would be removed with and without the approval of the vegetation variance.

F2-13 The Phase 4b Project has been designed to accommodate waterside vegetation and address the risk of levee instability by enlarging the footprint of the levees protecting the Natomas Basin. The intent of the project is to minimize or avoid impacts on waterside vegetation. The majority of the vegetation removal that will occur as a result of project construction is on the landside of the

levees. Thus, the referenced paragraph in Section 2.3.4.10, "Vegetation Management," in the DEIS/DEIR references landside vegetation mitigation. Waterside vegetation mitigation is included in Mitigation Measure 4.7-a, "Minimize Effects on Woodland Habitat; Implement Woodland Habitat Improvements and Management Agreements; Compensate for Loss of Habitat; and Comply with Section 7 of the Federal Endangered Species Act, Section 2081 of the California Endangered Species Act, and Section 1602 of the California Fish and Game Code," in Section 4.7, "Biological Resources," of the DEIS/DEIR.

F2-14 Comment noted. No changes made to the DEIS/DEIR.

F2-15 The first paragraph under the subheading, "Wildlife," in Section 3.7.2.1, "General Biological Resources," of the DEIS/DEIR is revised as follows:

> Before European settlement, the Sacramento area floodplains supported a wide variety and large numbers of wildlife species associated with its riparian habitats, permanent and seasonal wetlands, and oak woodlands and savannas. Much of this habitat has been lost, locally and regionally. Initially, land within the Natomas Basin was converted to agriculture, though more recent land use conversions have been to urban development. As a result, there have been shifts in wildlife use as land uses and habitats have changed. With the conversion to agriculture, the abundance of species restricted to natural habitats likely decreased, and in some cases particular species ceased to occur (City of Sacramento, Sutter County, and TNBC 2003). However, remnant native habitat patches and created habitat associated with drainage and agricultural supply ditches and habitat reserves have allowed remnant wildlife populations to persist within the Natomas Basin. Wildlife species common within the Natomas Basin include black-tailed jackrabbit, Audubon's cottontail, raccoon, striped skunk, California ground squirrel, mule deer, coyote, and river otter. Reptile species that are routinely encountered in the Natomas Basin include gopher snake, common garter snake, and racer snake~~,~~ Amphibian species that are routinely encountered in the Natomas Basin include Pacific chorus frog~~,~~ and bullfrog.

F2-16 See responses to comments F2-2 and F2-11.

F2-17 USACE's and SAFCA's intent is certainly to implement habitat creation and preservation effectively. However, this is not a certainty. The impact analysis and conclusion contained in the DEIS/DEIR attempt to be conservative in disclosing that if habitat creation and preservation is not implemented effectively, a potentially significant impact would result. Further, under the California Environmental Quality Act (CEQA) (State CEQA Guidelines, California Code of Regulations [CCR] Section 15126.4[a][3]), mitigation can only be required for significant and potentially significant impacts. Thus, the impact must at least be potentially significant to warrant mitigation.

F2-18 See response to comment F2-3.

F2-19 This comment pertains to the Natomas PACR. See Appendix A of the Natomas PACR for response.

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION IX
75 Hawthorne Street
San Francisco, CA 94105-3901

August 16, 2010

Ms. Elizabeth Holland
Environmental Resources Branch
U.S. Army Corps of Engineers
Sacramento District
1325 J Street, 10th Floor
Sacramento, California 95814-2922

Subject: Draft Environmental Impact Statement (DEIS) for the Natomas Levee Improvement Program Phase 4b Landside Improvements Project (CEQ# 20100240)

The U.S. Environmental Protection Agency (EPA) has reviewed the above-referenced document pursuant to the National Environmental Policy Act (NEPA), Council on Environmental Quality (CEQ) regulations (40 CFR Parts 1500-1508), and our NEPA review authority under Section 309 of the Clean Air Act.

F3-1

While we acknowledge the flood protection benefits of the proposed action for the current residents of the Natomas Basin, we have rated the DEIS as Environmental Concerns – Insufficient Information (EC-2, see enclosed "*Summary of Rating Definitions*") due to our concerns about air quality and indirect and induced growth.

EPA's primary concern regarding the subject DEIS is the applicability of conformity requirements under the Clean Air Act. We noted in our March 22, 2010 comments on the FEIS for Phase 4a of the Natomas Levee Improvement Project (NLIP) that "the State of California has requested, and EPA has proposed, a "severe" classification for this ozone nonattainment area." EPA finalized the severe classification, effective June 4, 2010. Because the Record of Decision (ROD) for Phase 4a was not certified before the effective date of the reclassification, the new conformity thresholds now apply to Phase 4a. Based on the FEIS, Phase 4a would exceed the recently reduced conformity threshold for 2011. Once conformity applies to a project, it applies to the entire project; thus, the applicability of conformity to Phase 4a would affect Phase 4b, as well.

F3-2

EPA staff discussed the conformity issue with you and a Corps' contractor in several phone conversations. Following that, you provided a revised table of emissions in an email to Tom Kelly, of my staff, on August 11, 2010. The table reflects a revised construction schedule with additional reduction of nitrogen oxide emissions, from 20% to 40%. Based on that revised table, the Phase 4a emissions no longer appear to exceed the conformity threshold. If the Corps intends to pursue this revised construction schedule, commitments to do so should be included in the ROD for Phase 4a and in the FEIS and ROD for Phase 4b. If the Corps does not intend to pursue this revised construction schedule, the RODs and Phase 4b FEIS should address how conformity requirements will be met.

We appreciate the opportunity to review this DEIS. When the FEIS is released for public review, please send one hard copy and one CD ROM to the address above (mail code: CED-2). If you have any questions, please contact Tom Kelly, the lead reviewer for this project, at (415) 972-3856 or kelly.thomasp@epa.gov, or me at (415) 972-3521. F3-3

Sincerely,

Tom Kelly

SUMMARY OF EPA RATING DEFINITIONS*

This rating system was developed as a means to summarize the U.S. Environmental Protection Agency's (EPA) level of concern with a proposed action. The ratings are a combination of alphabetical categories for evaluation of the environmental impacts of the proposal and numerical categories for evaluation of the adequacy of the Environmental Impact Statement (EIS).

ENVIRONMENTAL IMPACT OF THE ACTION

"LO" (Lack of Objections)

The EPA review has not identified any potential environmental impacts requiring substantive changes to the proposal. The review may have disclosed opportunities for application of mitigation measures that could be accomplished with no more than minor changes to the proposal.

"EC" (Environmental Concerns)

The EPA review has identified environmental impacts that should be avoided in order to fully protect the environment. Corrective measures may require changes to the preferred alternative or application of mitigation measures that can reduce the environmental impact. EPA would like to work with the lead agency to reduce these impacts.

"EO" (Environmental Objections)

The EPA review has identified significant environmental impacts that should be avoided in order to provide adequate protection for the environment. Corrective measures may require substantial changes to the preferred alternative or consideration of some other project alternative (including the no action alternative or a new alternative). EPA intends to work with the lead agency to reduce these impacts.

"EU" (Environmentally Unsatisfactory)

The EPA review has identified adverse environmental impacts that are of sufficient magnitude that they are unsatisfactory from the standpoint of public health or welfare or environmental quality. EPA intends to work with the lead agency to reduce these impacts. If the potentially unsatisfactory impacts are not corrected at the final EIS stage, this proposal will be recommended for referral to the Council on Environmental Quality (CEQ).

F3-1
(Con't.)

ADEQUACY OF THE IMPACT STATEMENT

Category "1" (Adequate)

EPA believes the draft EIS adequately sets forth the environmental impact(s) of the preferred alternative and those of the alternatives reasonably available to the project or action. No further analysis or data collection is necessary, but the reviewer may suggest the addition of clarifying language or information.

Category "2" (Insufficient Information)

The draft EIS does not contain sufficient information for EPA to fully assess environmental impacts that should be avoided in order to fully protect the environment, or the EPA reviewer has identified new reasonably available alternatives that are within the spectrum of alternatives analyzed in the draft EIS, which could reduce the environmental impacts of the action. The identified additional information, data, analyses, or discussion should be included in the final EIS.

Category "3" (Inadequate)

EPA does not believe that the draft EIS adequately assesses potentially significant environmental impacts of the action, or the EPA reviewer has identified new, reasonably available alternatives that are outside of the spectrum of alternatives analyzed in the draft EIS, which should be analyzed in order to reduce the potentially significant environmental impacts. EPA believes that the identified additional information, data, analyses, or discussions are of such a magnitude that they should have full public review at a draft stage. EPA does not believe that the draft EIS is adequate for the purposes of the NEPA and/or Section 309 review, and thus should be formally revised and made available for public comment in a supplemental or revised draft EIS. On the basis of the potential significant impacts involved, this proposal could be a candidate for referral to the CEQ.

*From EPA Manual 1640, Policy and Procedures for the Review of Federal Actions Impacting the Environment.

EPA'S DETAILED DEIS COMMENTS ON DRAFT ENVIRONMENTAL IMPACT STATEMENT (DEIS) NATOMAS LEVEE IMPROVEMENT PHASE 4B LANDSIDE IMPROVEMENTS PROJECT (CEQ# 20100240) SACRAMENTO AND SUTTER COUNTY, CA, AUGUST 16, 2010

Air Quality

The DEIS discusses the applicability of general conformity in Impact 4.11-b. For the proposed alternative, the DEIS states, "[w]ith mitigation, worst-case maximum annual emissions are below the *de minimis* [stat] thresholds and therefore would conform with the applicable SIP regional attainment goals (See Appendix F for detailed emission sources and assumptions)" (p.4-17). EPA does not agree with this conclusion. The general conformity thresholds for Volatile Organic Compounds (VOCs) and Nitrogen Oxides (NOx) were reduced, effective June 4, 2010 (75 FR 24409, May 5, 2010,), as noted in the DEIS, Table 4.11-4 and Appendix F. Since the Corps did not sign the ROD for Phase 4A prior to that date (p. ES-6), the new conformity limits apply to Phase 4a as well as 4b. Phase 4A emissions, described in Appendix F, exceed the current 25 tons per year general conformity threshold for NOx. Once conformity applies to a project, it is applicable to the entire project. So, if conformity applies to Phase 4A, it also applies to Phase 4B, regardless of the level of 4B emissions.

EPA staff raised this to the attention of the Corps and its contractor in several phone conversations. The Corps subsequently provided an alternative Table 21 that spread Phase 4a construction into 2012, and reduced NOx emissions, by 40%, to below the conformity threshold. Your contractor's message[1] clarified that the reduced emissions will be achieved through vehicle emission controls, not emission credits or off-sets purchased from a local air district. The table also reflected other schedule changes for Phase 4b. F3-4

The revised table also showed reduced emissions for 2009 and 2010. Because 2009 is past and 2010 is more than half over, it is not clear how these emissions could be reduced.

Table 21 and Table 22, from Appendix F, contain differing emission estimates for 2010 and 2011. The Corps contractor clarified[2] that "the emission levels shown in Table 22 in Appendix F were not used in the analysis and should be considered extraneous."

We also note the wording "would conform with the applicable SIP" (p. 4.11-17) is inappropriate. Such wording should be used only if the Corps is making an affirmative determination that the project conforms to the applicable SIP, pursuant to analysis showing that the project's emissions will be over the de minimis applicability threshold.

[1] "In Case You Were Interested" Message to Tom Kelly (EPA) from Gregory Wolffe (AECOM). 12 August 2010. Email.
[2] "Conference Call This Afternoon Re: Natomas." Message to John Kelly (EPA) from Gregory Wolffe (AECOM). 29 July 2010. E-mail.

Recommendation:
The FEIS should describe and commit to project changes that reduce emissions below the general conformity applicability threshold. If the Corps will rely on extension of the project schedule, in accordance with the alternative Table 21 provided to EPA, that table and any supporting information should be included in the Phase 4a and 4b RODs and the Phase 4b FEIS.

Alternatively, the FEIS could include a conformity determination that includes both Phase 4a and 4b. F3-4 (Con't.)

The FEIS should remove Table 22 from Appendix F.

The FEIS should include a footnote for Table 21, in Appendix F , explaining that 2010 air emissions, from Phase 3 of the project, were included in the phase 3 FEIS which was relied upon in the phase 3 ROD, prior to the conformity limit change from 50 to 25 tons per year. Therefore, 50 tons per year was the correct general conformity applicability threshold to apply to Phase 3 for VOC and NOx.

Indirect and Growth Inducing Impacts

While the levees have been in place since 1915 (Table 1-2), currently the Natomas Basin (Basin) is subject to a building moratorium (p. 3-21). Without improvement of the levees, further development within the Basin will continue to be limited by the moratorium. The DEIS describes planned growth within the Natomas Basin of 60,000 dwellings and associated commercial and residential developments over the next two decades (p.2-81). The increase in emission of criteria pollutants from this development can cause health problems and further delay attainment of air quality standards set by the Clean Air Act.

The DEIS describes a regional blueprint for future growth in the Sacramento area, including the Natomas Basin, adopted by the Sacramento Area Council of Governments (SACOG) and Valley Vision (p. 2-16). EPA commends the Corps and Sacramento Area Flood Control Agency (SAFCA) for including the blueprint, a "unique regional visioning project . . . bringing smart growth principles . . . to growth projected in the Sacramento Region until 2050[3]." EPA supports this effort for the people of the Sacramento area to "spend less time in their cars, spend less money on gas, and protect our air quality while improving our overall quality of life," and we acknowledge the greenhouse gas benefits of the development recommended by the blueprint. Unfortunately, the DEIS does not commit to ensuring that future growth in the Basin is consistent with the blueprint. F3-5

The DEIS ultimately concludes, "the Phase 4b Project, while accommodating planned regional growth, is not growth inducing itself" (p.5-37). This distinction (accommodating growth vs. inducing growth) does not exist in NEPA regulations. Because the levee improvements will allow future growth in the basin, which is not currently allowed, the project will induce growth.

[3] "Blueprint Then/Now/Next." *Sacramento Region Blueprint.* Sacramento Council of Governments, n.d. Web. 23 July 2010. <http://www.sacregionblueprint.org>.

Furthermore, SAFCA's reliance on development fees implies that growth in the Natomas Basin may be critical to funding future flood protection efforts. The DEIS explains (p. 2-81) that SAFCA will use development fees to fund activities that appear unrelated to development: waterside levee strengthening, landside levee strengthening, acquisition of agricultural easements (outside the basin), and improved system operations. The development impact fee applies to "all new structures placed anywhere in the 200-year (0.005 AEP) floodplain of SAFCA's capital assessment district." This implies the fee will be collected from many locations within SAFCA's jurisdiction. Yet, the vast majority of the remaining land to be developed appears within the 200-year floodplain appears to be located in the Natomas Basin, based on the SAFCA Boundary Map.

While the DEIS frequently notes the project is intended provide flood protection to current residents and property, the income generated from development fees appears to be a critical piece to ensuring adequate flood control protection remains in place. This further establishes growth inducement and future development as indirect impacts of the Natomas Levee Improvement Project.

F3-5
(Con't.)

The DEIS states that the City of Sacramento, Sacramento County, and Sutter County, which comprise three fifths of the organizations that comprise SAFCA, have developed general plans that provide a framework for growth and development within their jurisdictions. The DEIS does not state whether or not these plans are consistent with the blueprint. Several reports have documented that development fees are a significant revenue source for local governments[4]. The City and County of Sacramento have even developed a revenue sharing agreement for development in the Natomas Basin[5]. Like SAFCA, these entities are reliant on future development in the Natomas Basin to reduce future financial shortfalls.

EPA does not oppose development in the Natomas Basin, although we would advise against it in the deepest portions of the floodplain; however, we do think the FEIS should acknowledge that development is not incidental to the levee project, but an indirect and growth inducing impact of the project.

Recommendation:
The FEIS should describe all indirect and growth inducing impacts, including emissions of priority air pollutants and greenhouse gases from industrial, commercial, and residential development planned for the Natomas Basin.

---

[4] For example, "Pay to Play, Residential Development Fees in California Cities and Counties, 1999." California Department of Housing and Community Development. Web. August 11, 2010. <http://www.hcd.ca.gov/hpd/pay2play/fee_rpt.pdf>

[5] "Resolution No. 2002-830, Adopted by the Sacramento City Council on the date of December 10, 2002." Web. August 11, 2010. < http://www.msa2.saccounty.net/planning/Documents/Natomas%20Joint%20Vision/City-CountyMemorandumofUnderstanding.pdf>

To mitigate air pollution and traffic congestion from new housing, the FEIS should commit to ensuring future development in the Natomas Basin will be consistent with the SACOG and Valley Vision blueprint.

F3-5
(Con't.)

The FEIS should acknowledge that development fees are a necessary source of revenue to ensure future flood protection within SAFCA's jurisdiction.

F3-1 See responses to comments F3-2, F3-4, and F3-5.

F3-2 U.S. Environmental Protection Agency (EPA) General Conformity thresholds for volatile organic compounds (VOCs) and Nitrogen Dioxides (NO_X) for the Sacramento Metropolitan area were reduced from 50 tons per year (TPY) to 25 TPY, effective June 4, 2010. The reduced conformity threshold applies to the NLIP project phases beginning in 2011 through completion (projected to the year 2016). Revisions, including schedule adjustments and increased NO_X control efficiency (from 20% to 40%, based on contractor fleet requirements), have been incorporated into Section 4.11, "Air Quality," of the FEIS/FEIR and these adjustments provide demonstration that the NLIP (during 2011 through 2016) would achieve emissions below the reduced General Conformity threshold. Revisions to the tables in Sections 3.11, "Air Quality," and 4.11, Air Quality," of the DEIS/DEIR are shown in tracked changes in **Appendix F** of this FEIS/FEIR. Additionally, the air quality modeling has been updated and is included in **Appendix F** (Table 21).

F3-3 The FEIS/FEIR will be provided to EPA as well as all other commenters.

F3-4 See response to comment F3-2.

The achievement of 40% NO_X control, as proposed, would be demonstrated through newer model year contractor equipment that would be required by the project proponent(s). Based on contractor fleet inventories provided to the Sacramento Metropolitan Air Quality Management District (SMAQMD) pertaining to construction activities currently under way for previous NLIP project phases, contractor fleet inventories have typically shown a reduction of 60–65% compared to the California Air Resources Board (ARB) fleetwide average. Therefore, emissions during 2009 and 2010, based on actual fleet inventory data, are estimated to have achieved at least a 40% emissions reduction.

Table 22, which was originally included in **Appendix F** of the DEIS/DEIR was an extraneous table and has been removed from this FEIS/FEIR.

The second bullet under "Construction in Sacramento County (SMAQMD)," in Mitigation Measure 4.11-a, "Implement Applicable District-Recommended Control Measures to Minimize Temporary and Short-Term Emissions of ROG, NO_X, and PM_{10} During Construction," of the DEIS/DEIR is revised as follows:

- If overlapping construction phases in Sacramento County create unmitigated PM_{10} emissions in excess of the General Conformity threshold, per SMAQMD Rule 104, of ~~400~~100 TPY, the project proponent(s) shall use advanced dust suppressant materials (such as EnviroTac II) on all unpaved roadways and stockpiled materials to ensure enhanced fugitive dust control up to 90% or greater ~~control~~ of fugitive dust and ~~a reduction of~~ PM_{10} emissions ~~below 100 TPY~~.

In addition, a second footnote is included in the revised Table 21 (in Appendix F of the DEIS/DEIR) as follows:

[1] Control efficiencies are based on implemented control measures, per SMAQMD CEQA Guidance: control efficiency for NO_X emissions is based on enhanced exhaust

control measures per SMAQMD CEQA Guidance, including submittal of contracted construction fleet inventories for demonstration of 20% control compared to the ARB fleetwide average, with an additional 20% reduction imposed by the project to meet general conformity.

[2] Emissions from Phase 3 were included in the Phase 3 FEIS, and were approved through the authorization of the Record of Decisions (ROD), prior to the conformity limit change from 50 TPY top 25 TPY. Therefore, 50 TPY is the correct General Conformity Threshold applicable to Phase 3 emissions of VOCs and NO_X.

F3-5 Growth-inducing impacts of the NLIP are discussed in Section 5.2, "Growth Inducement," of the DEIS/DEIR. As described in that section, population growth and urban development within the project area are driven by local, regional, and national economic conditions. Local land use decisions within the Phase 4b Project area are within the jurisdiction of the City of Sacramento. The City has adopted a general plan consistent with state law that provides an overall framework for growth and development within its jurisdiction, including the project area. Although the City is a member of SAFCA, as a joint powers agency, SAFCA is limited to exercising powers common to all of its constituent members, including Reclamation District 1000 (RD 1000) and the American River Flood Control District, neither of which has any land use planning authority. Accordingly, SAFCA has no authority to permit development and has only limited authority to impose conditions on the development that is permitted.

The Blueprint prepared by the Sacramento Area Council of Governments (SACOG) serves as a serve as a framework to guide local government in growth and transportation planning through 2050, however, compliance with the principles of the Blueprint are not mandatory for local land use planning agencies. Because the local land use planning authority rests with local agencies (City of Sacramento, Sacramento County, Sutter County), neither USACE nor SAFCA have authority to ensure that future growth is consistent with the Blueprint.

Neither USACE nor SAFCA have the authority to plan land uses or direct development within the Natomas Basin. When developing the Phase 4b Project, USACE and SAFCA considered the planned regional growth as projected by local land use planning agencies. The cumulative impacts of this planned growth have been addressed in environmental documents prepared by the local land use planning agencies. Thus, the Phase 4b Project is not growth-inducing itself.

SAFCA has adopted a development fee program to ensure that new development in the undeveloped areas in the Natomas Basin and lower American River areas would not substantially increase the expected damage of an uncontrolled flood. The fee program is based upon the creation of a new assessment district and a development fee program to fund various project-related activities. The assessment district encompasses the properties in the developed areas within SAFCA's jurisdictional boundary in Sacramento and Sutter Counties that specially benefit from the activities and improvements. (See Section 3.2.1, "Project Features," of the *Environmental Impact Report on Local Funding Mechanisms for Comprehensive Flood Control Improvements for the Sacramento Area,* State Clearinghouse No. 2006072098).

RE: Comments on the American River Watershed Post-Authorization Change Report & Interim General Reevaluation Report & the Draft EIS/Draft EIT on the American River Watershed Common Features Project/Natomas Post-authorization Change Report/Natomas Levee Improvement Program, Phase 4b Landside Improvements Project

Dear: Ms. Holland

The Shingle Springs Band of Miwok Indians, ("Tribe"), has reviewed the American River Watershed Post-Authorization Change Report & Interim General Reevaluation Report & the Draft EIS/Drat EIT on the American River Watershed Common Features Project/Natomas Post-authorization Change Report/Natomas Levee Improvement Program, Phase 4b Landside Improvements Project (the "Reports"). Thank you very much for the opportunity to comment. The Tribe commends the USACE & SAFCA officials and representatives for producing a plan that strives to balance the numerous interests of the Parties affected and the safety of the residents of the Sacramento Valley. By and large, the plan represents a great amount of thought and consideration towards the Tribe and associated cultural remains. However the Tribe has various concerns about the draft, in particular, omissions of certain Tribal interests and areas where interests could be articulated more precisely. T1-1

The majority of the document appears thoughtfully crafted and the Tribe believes that Tribal issues in general have been keenly addressed. The Tribe feels that the USACE & SAFCA has shown a commitment to ensuring inclusion, fair treatment, and equitable outcomes between the tribes, Sacramento residents, and flood prevention. Recognizing the outstanding work done to produce these Reports, the Tribe would like to submit comments as outlined in the enclosed chart.

*(**Note: The comments have been arranged in chart form by page number, and include the title of the section and the heading to which they correspond. Included in each comment is a recommended addition to the existing text or in some cases, a slight revision.)*

Conclusion

With these changes, the Tribe feels that the Reports will accurately represent the cooperative and equitable relationship that the USACE & SAFCA and Tribe envision. By accurately encompassing the cultural and communal welfare of the Tribe, the Reports can reflect the positive working relationship between tribes and the USACE & SAFCA.

Thank you for this opportunity to comment on USACE & SAFCA's work and the Tribe looks forward to continuing to be a part of USACE & SAFCA's process.

Very Truly Yours,

John Tayaba
Vice Chairperson
Most Likely Descendant

3.8 CUTURAL RESOURCES, 3-74 to 3-88; 4.8 Cultural Resources, 4.8-1	Testing	The Tribe would like consult in more detail where known cultural resources have been identified, in addition to having tribal monitors

T1-2

T1-3

to4.8-13		present at all ground disturbing activity in the vicinity of the known site, including any testing. At sites where testing has not yet been performed, the Tribe would like to have testing at depths of at least 6 feet. When testing has been performed along the shore only, the Tribe would like testing to be done up through 150-200 yards from the shore, where impacts from the project are likely, so as to further mitigate potential damage. Also, the Tribe would like testing to be done at all borrow sites, before borrowing can begin.	T1-3 (Con't.)
4.8-7 Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative	Construction of the Phase 4b Project may affect two identified prehistoric archaeological deposits: NLIP-40, which consists of a newly identified prehistoric resource that occurs in the Fisherman's Lake Borrow Area…	Is there an alternative for borrowing from an area that does not contain cultural resources such as CA-Sac-18, and the site in the South Fisherman's Lake Borrow Area? The Tribe would like to see a reasonable effort made to Borrow from areas not containing cultural resources.	T1-4

T1-1 Comment noted.

T1-2 This comment pertains to the Natomas PACR. See Appendix A of the Natomas PACR for response.

T1-3 USACE will continue to consult with local tribes on known cultural resources that have been identified as affected by the NLIP, including the Phase 4b Project. Tribal monitors are not required by Federal law; however, Shingle Springs Rancheria or other local tribes or interested parties may provide monitors at their own cost as safety and construction permits. Surveying of the area of potential effects of the project area will occur prior to construction activities to determine the presence of potential cultural resources and determine the potential need for further testing to evaluate significance and effects. This may include limited shovel testing or auguring, where it is determined that ground cover or recent deposits would obscure cultural materials. This includes all non-commercial borrow sties before their use as borrow material. Commercial borrow sites will not be tested further as they will have already been required to comply with the National Historic Preservation Act.

T1-4 USACE will make good faith efforts to identify other sources of borrow material that do not include identified prehistoric or historic resources.

John Bassett
Sacramento Area Flood Control Agency
1007 7th Street, 7th Floor
Sacramento, CA 95814

Dear Mr. Bassett:

State Clearinghouse (SCH) Number: 2009112025
Draft Environmental Impact Report Natomas Post-Authorization Change Report/Natomas Levee Improvement Program, Phase 4b Project

Staff for the Central Valley Flood Protection Board has reviewed the subject document and provides the following comments:

The proposed project is located within the jurisdiction of the Central Valley Flood Protection Board. The Board is required to enforce standards for the construction, maintenance and protection of adopted flood control plans that will protect public lands from floods. The jurisdiction of the Board includes the Central Valley, including all tributaries and distributaries of the Sacramento River and the San Joaquin River, and designated floodways (Title 23 California Code of Regulations (CCR), Section 2).

A Board permit is required prior to starting the work within the Board's jurisdiction for the following:

- The placement, construction, reconstruction, removal, or abandonment of any landscaping, culvert, bridge, conduit, fence, projection, fill, embankment, building, structure, obstruction, encroachment, excavation, the planting, or removal of vegetation, and any repair or maintenance that involves cutting into the levee (CCR Section 6); S1-1

- Existing structures that predate permitting or where it is necessary to establish the conditions normally imposed by permitting. The circumstances include those where responsibility for the encroachment has not been clearly established or ownership and use have been revised (CCR Section 6);

- Vegetation plantings will require the submission of detailed design drawings; identification of vegetation type; plant and tree names (i.e. common name and scientific name); total number of each type of plant and tree; planting spacing and irrigation method that will be within the project area; a complete vegetative management plan for maintenance to prevent the interference with flood control, levee maintenance, inspection and flood fight procedures (Title 23, California Code of Regulations CCR Section 131).

Potential significant effects - According to the draft document p. 4.7 – 8 "The plan for compensation for impacts to landside woodland would include transplanting suitable trees from the Phase 4b Project area, where feasible, as well as planting a variety of native tree species to create woodland habitat. Potential sites for plantings to compensate for landside woodland impacts would include locations along Reach A:16 of the Sacramento River east levee, and along Lower Dry Creek, immediately east of the NEMDC."

In accordance with CCR, Section 131 "(c) Vegetation must not interfere with the integrity of the adopted plan of flood control, or interfere with maintenance, inspection, and flood fight procedures." The draft document does not include detailed planting and management plans for the proposed increase in woodland habitat of the Sacramento River east levee, and along Lower Dry Creek. As a result, potential significant hydrological impacts due to the woodland plantings included in the proposed project could not be determined. The draft document should provide additional analysis and evaluation of the potential impacts and mitigation measures reducing impacts to the operations and maintenance of the flood control system and to the system's functioning. S1-1 (Con't.)

The permit application and Title 23 CCR can be found on the Central Valley Flood Protection Board's website at http://www.cvfpb.ca.gov/. Contact your local, federal and state agencies, as other permits may apply.

If you have any questions please contact me at (916) 574-0651 or by email jherota@water.ca.gov.

Sincerely,

James Herota

S1-1 Comment noted.

Impact 4.5-b, "Alteration of Local Drainage," in the DEIS/DEIR addresses impacts associated with woodland planting in Lower Dry Creek. Mitigation Measures 4.5-b(1), "Coordinate with Landowners and Drainage Infrastructure Operators, Prepare Final Drainage Studies as Needed, and Implement Proper Project Design," and 4.5-b(2), "Prepare Hydraulic Study, and Design and Implement Lower Dry Creek Woodland Panting Areas to Avoid Adverse Hydraulic Effects," in the DEIS/DEIR would reduce this impact to a less-than-significant level.

Subject: Draft Environmental Impact Statement/Environmental Impact Report (DEIS/DEIR) for the American River Watershed Common Features Project / Natomas Post-authorization Change Report / Natomas Levee Improvement Program, Phase 4b Landside Improvements Project

Dear Mr. Bassett:

The California State Lands Commission (CSLC) staff has reviewed the subject DEIS/DEIR dated July 2, 2010. For this project, the CSLC is a Trustee Agency and, depending on the final alternative selected, may also be a Responsible Agency.

As general background, the State acquired sovereign ownership of all tidelands and submerged lands and beds of navigable waterways upon its admission to the United States in 1850. The State holds these lands for the benefit of all the people of the State for statewide Public Trust purposes of waterborne commerce, navigation, fisheries, water-related recreation, habitat preservation and open space. The State owns sovereign fee title to tide and submerged lands landward to the mean high tide line (MHTL) as they existed in nature, prior to fill or artificial accretions. On navigable non-tidal waterways, the State holds fee ownership of the bed landward to the ordinary low water mark and a Public Trust easement landward to the ordinary high water mark, as they last naturally existed. The State's sovereign interests are under the jurisdiction of the CSLC. S2-1

The current project is to address improving the 42 miles of flood protection levees for the Natomas Basin. The improvements will increase the level of flood protection to achieve a minimum of 200-year flood protection. Improvements to the levee system will result in disturbance and the potential loss of riparian habitat along sections of the proposed project. These changes, along with those proposed for the other levee system enhancements in the Sacramento Valley, will result in a cumulative loss of riparian vegetation and shaded riverine aquatic habitat along the river bank, which will be difficult to mitigate and may result in secondary impacts to the listed runs of salmonids and listed avian species. The CSLC recommends that the Sacramento Area Flood Control Agency work very closely with the California Department of Fish and S2-2

Game, U.S. Fish and Wildlife Service, NOAA Fisheries, and other applicable resources agencies, as well as with local representatives of adjoining landowners (such as the Sacramento River Conservation Area Forum), to address these cumulative impacts and to design appropriate mitigation/conservation areas. Other types of mitigation, such as avoidance, both in time and space (such as construction work windows), will also need to be considered. S2-2 (Con't.)

To the extent the proposed project involves State-owned sovereign lands including, but not limited to, the Sacramento River and the American River, a lease from the Commission will be required. Please contact Diane Jones at 916-574-1843 for information concerning our leasing requirements. If you have any questions concerning the environmental review, please contact Chris Huitt at (916) 574-1938 or by e-mail at huittc@slc.ca.gov. S2-3

Sincerely,

Cy R. Oggins, Chief
Division of Environmental Planning
and Management

cc: Office of Planning and Research
D. Jones, CSLC
C. Huitt, CSLC

S2-1 Comment noted.

S2-2 Impact 4.7-a, "Loss of Landside and Waterside Woodland and Shaded Riverine Aquatic Habitats," in the DEIS/DEIR addresses impacts associated with the loss of shaded riverine aquatic (SRA) habitat. Mitigation Measure 4.7-a, "Minimize Effects on Woodland Habitat; Implement Woodland Habitat Improvements and Management Agreements; Compensate for Loss of Habitat; and Comply with Section 7 of the Federal Endangered Species Act, Section 2081 of the California Endangered Species Act and Section 1602 of the California Fish and Game Code," in the DEIS/DEIR requires that the project proponent(s) consult with NMFS, under the Federal Endangered Species Act (ESA), and the California Department of Fish and Game (DFG), under the California Endangered Species Act (CESA), regarding potential impacts to the loss of SRA habitat on Federally and state-listed fish species, respectively. Implementation of measures developed under ESA Section 7 and CESA consultation will be designed to ensure no net loss of SRA habitat function.

Section 5.1.5.6, "Water Quality/Fisheries," under the subheading "Phase 4b Project: Fisheries," in the DEIS/DEIR concludes that, combined with previous channel alterations, the Phase 4b Project would result in a cumulatively considerable incremental contribution to a cumulatively significant impact related to the loss of SRA habitat and woody debris.

S2-3 Comment noted. The project proponent(s) will meet the California State Lands Commission's leasing requirements, as necessary.

American River Watershed Common Features Project Natomas Basin
Draft Environmental Impact Report
SCH# 2009112025

John Bassett, Director of Engineering
Sacramento Area Flood Control Agency (SAFCA)
1007 7th Street, 7th Floor
Sacramento, CA 95814

Dear Mr. Bassett:

Thank you for the opportunity to review and comment on the Draft Environmental Impact Statement/Draft Environmental Impact Report (DEIS/DEIR) for the American River Watershed Common Features Project/Natomas Levee Improvement Program, Phase 4b Landside Improvements Project and the Draft Natomas Post-Authorization Change Report. This review of Phase 4b is a portion of the process required to upgrading the levees in the Natomas area as part of the Natomas Levee Improvement Program. Our comments are as follows:

S3-1

- Caltrans Encroachment Permits will be required for levee improvements at the Interstate 5 (I-5) American River North Levee crossing and the Interstate 80 (I-80) crossings across Sacramento River East Levee as well as the Natomas East Main Drainage Canal South Levee. All work proposed and performed within the State Highway right-of-way must be in accordance with Caltrans' standards. For more information on encroachment permits, the requirements, and an application form, please visit our web page at www.dot.ca.gov/doingbusiness and then click on "Encroachment Permits" or contact the Caltrans District 3, Office of Permits at (530) 741-4403.

- Caltrans District 3 would appreciate the opportunity to review the plans for levee improvements at the highway crossings.

S3-2

- The American River North Levee and Sacramento River East Levee 3B run under bridge structures on piers. Please provide a list of they type of equipment to be used under the structures and the plans/procedures in place to prevent any damage to existing bridge piers. S3-3

- The North East Main Drainage Canal South Levee runs under the bridge across the canal in close proximity to the bridge abutments. Please provide plans for the levee improvements at this location for Caltrans review. S3-4

If you have any questions regarding these comments, please contact Sadie Smith at (530) 741-4004 or sadie_smith@dot.ca.gov.

Sincerely,

Alyssa Begley

ALYSSA BEGLEY, Chief
Office of Transportation Planning - South

S3-1 As noted in Section 1.7.2.2, "State Actions/Permits," of the DEIS/DEIR, a California Department of Transportation (Caltrans) encroachment permit is listed as a requirement for project implementation, as appropriate.

S3-2 USACE and/or SAFCA will coordinate with Caltrans District 3, as appropriate, to ensure appropriate Caltrans review and input is received regarding highway crossings and construction near bridge structures. Additionally, Mitigation Measure 4.10-a, "Prepare and Implement a Traffic Safety and Control Plan for Construction-Related Truck Trips," in the DEIS/DEIR requires the preparation of a traffic safety and control plan as well as a Transportation Management Plan, both of which would be submitted to Caltrans for review.

S3-3 See response to comment S3-2.

S3-4 See response to comment S3-2.

Subject: Common Features/Natomas PACR/Natomas Levee Improvement Program, Phase 4b Project
SCH#: 2009112025

Dear John Bassett:

The State Clearinghouse submitted the above named Draft EIR to selected state agencies for review. On the enclosed Document Details Report please note that the Clearinghouse has listed the state agencies that reviewed your document. The review period closed on August 16, 2010, and the comments from the responding agency (ies) is (are) enclosed. If this comment package is not in order, please notify the State Clearinghouse immediately. Please refer to the project's ten-digit State Clearinghouse number in future correspondence so that we may respond promptly.

Please note that Section 21104(c) of the California Public Resources Code states that:

> "A responsible or other public agency shall only make substantive comments regarding those activities involved in a project which are within an area of expertise of the agency or which are required to be carried out or approved by the agency. Those comments shall be supported by specific documentation."

S4-1

These comments are forwarded for use in preparing your final environmental document. Should you need more information or clarification of the enclosed comments, we recommend that you contact the commenting agency directly.

This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act. Please contact the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process.

Sincerely,

Scott Morgan
Director, State Clearinghouse

Project Title Common Features/Natomas PACR/Natomas Levee Improvement Program, Phase 4b Project
Lead Agency Sacramento Area Flood Control Agency

Type EIR Draft EIR

Description The overall purpose of the Natomas Levee Improvement Program (NLIP) is to bring the entire 42-mile Natomas Basin perimeter levee system into compliance with applicable Federal and state standards for levees protecting urban areas. The Phase 4b - Project - a component of the NLIP - consists of improvements to the remaining portions of the Natomas Basin's perimeter levee system and associated landscape, irrigation/drainage infrastructure modifications, and environmental mitigation, including habitat creation and management.

Sacramento, CA 95814

American River Watershed Common Features Project, Natomas Levee Improvement Program (NLIP), Phase 4b Landside Improvements Project DEIS/DEIR (SAC200701184f)

Dear Mr. Bassett and Ms. Holland:

Thank you for providing the NLIP Phase 4b Landside Improvements Project DEIS/DEIR to the Sacramento Metropolitan Air Quality Management District (SMAQMD) for review. SMAQMD staff comments follow.

1. Please provide the analysis justifying the statement that a dust control plan has been developed that will "effectively reduce mass PM10 emissions below the concentration based threshold" (page 4.11-6, paragraph 2). Has modeling been performed to show concentrations below the 5% substantial contribution in non-attainment areas? L1-1
2. Why was the level of 400 tons/year of PM10 selected as a trigger to include the use of advanced dust suppression materials (page 4.11-14, last bullet)? L1-2
3. Would the application of advanced dust suppression materials reduce PM10 emissions from 400 to 100 tons/year (page 4.11-14, last bullet)? L1-3
4. The SMAQMD prefers that an estimated mitigation fee be disclosed in the DEIS/DEIR based on the emissions estimates and mitigation measures provided in the document (page 4.11-15, 4th bullet). L1-4
5. Because there is concern in the construction industry regarding the safe operation of off-road equipment with a diesel particulate filter (DPF) that blocks driver visibility, the SMAQMD suggests an alternative mitigation be available to the 15% DPF installation for off-road equipment. SMAQMD has determined that an additional 20% reduction in project-wide fleet average particulate emissions would be beneficial, which brings the total particulate emission reduction to 65% compared to the state fleet average (page 4.11-16, last bullet). L1-5
6. SMAQMD suggests adding the word "not" in the 3rd to last sentence of the first paragraph on page 4.11-23, regarding exposing sensitive receptors to substantial concentrations of Toxic Air Contaminants. L1-6

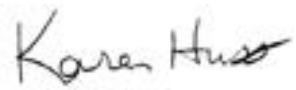
777 12th Street, 3rd Floor ▪ Sacramento, CA 95814-1908
916/874-4800 ▪ 916/874-4899 fax
www.airquality.org

7. Overall, the climate change and greenhouse gas discussion and analysis were done well (section 5.1.5.12). L1-7
8. The listing of potential greenhouse gas mitigation measures on page 5-22 should be referenced in Table ES-2, Summary of Impacts and Mitigation Measures, and/or another obvious place in the DEIS/EIR that future contractors will reference for project construction requirements. L1-8

All projects are subject to SMAQMD rules in effect at the time of construction. Attached is a list of rules that may apply to this project. For more information on SMAQMD rules call 916-874-4800 or visit www.AirQuality.org. L1-9

Please contact me at 916-874-4881 or khuss@airquality.org if you have any questions regarding these comments.

Sincerely,



Karen Huss
Associate Air Quality Planner/Analyst

Attachment

Cc: Larry Robinson, Sacramento Metropolitan Air Quality Management District
Sondra Andersson, Feather River Air Quality Management District

SMAQMD Rules & Regulations Statement (revised 1/07)

*The following statement is recommended as standard condition of approval or construction document language for **all** development projects within the Sacramento Metropolitan Air Quality Management District (SMAQMD):*

All projects are subject to SMAQMD rules and regulations in effect at the time of construction. A complete listing of current rules is available at www.airquality.org or by calling 916.874.4800. Specific rules that may relate to construction activities or building design may include, but are not limited to:

Rule 201: General Permit Requirements. Any project that includes the use of equipment capable of releasing emissions to the atmosphere may require permit(s) from SMAQMD prior to equipment operation. The applicant, developer, or operator of a project that includes an emergency generator, boiler, or heater should contact the District early to determine if a permit is required, and to begin the permit application process. Portable construction equipment (e.g. generators, compressors, pile drivers, lighting equipment, etc) with an internal combustion engine over 50 horsepower are required to have a SMAQMD permit or a California Air Resources Board portable equipment registration.

L1-9
(Con't.)

Other general types of uses that require a permit include dry cleaners, gasoline stations, spray booths, and operations that generate airborne particulate emissions.

Rule 403: Fugitive Dust. The developer or contractor is required to control dust emissions from earth moving activities or any other construction activity to prevent airborne dust from leaving the project site.

Rule 417: Wood Burning Appliances. Effective October 26, 2007, this rule prohibits the installation of any new, permanently installed, indoor or outdoor, uncontrolled fireplaces in new or existing developments.

Rule 442: Architectural Coatings. The developer or contractor is required to use coatings that comply with the volatile organic compound content limits specified in the rule.

Rule 902: Asbestos. The developer or contractor is required to notify SMAQMD of any regulated renovation or demolition activity. Rule 902 contains specific requirements for surveying, notification, removal, and disposal of asbestos containing material.

L1-1 Emissions modeling was conducted to evaluate potential air quality impacts from emissions of particulate matter with an aerodynamic diameter of 10 micrometers or less (PM_{10}), using emission factors derived from the SMAQMD Road Construction Model, Versions 6.3.2. as well as EPA's AP-42 factors for bulldozing and haul transport on paved and unpaved roads. A Fugitive Dust Control Plan would be developed by the construction contractor(s) and will include enhanced fugitive dust control measures, as recommended by SMAQMD. Therefore, dispersion modeling has not been conducted for this air quality analysis. Upon further request, significance determination can be demonstrated using supporting dispersion modeling outcomes.

L1-2 SMAQMD notes that 400 tons per year of PM_{10} appears to have been selected as a trigger for implementation of advanced dust suppression technologies. This is a typographical error. The trigger for use of advanced suppression or chemical stabilizers is 100 tons per year, consistent with the threshold established per SMAQMD Rule 104 as well as EPA's General Conformity Rule.

The second bullet under the subheading, "Construction in Sacramento County (SMAQMD)," under Mitigation Measure 4.11-a, "Implement Applicable District-Recommended Control Measures to Minimize Temporary Emissions of ROG, NO_X, and PM_{10} during Construction," of the DEIS/DEIR has been modified as follows:

- If overlapping construction phases in Sacramento County create unmitigated PM_{10} emissions in excess of the General Conformity threshold, per SMAQMD Rule 104, of ~~400~~ 100 TPY, the project proponent(s) shall use advanced dust suppressant materials (such as EnviroTac II) on all unpaved roadways and stockpiled materials to ensure enhanced fugitive dust control up to 90% or greater ~~control~~ of fugitive dust and ~~a reduction of~~ PM_{10} emissions ~~below 100 TPY~~.

L1-3 See response to comment L1-2.

L1-4 The total estimated fee, including a 5% administrative fee, for Phase 4b Project elements occurring during the 2012 through 2016 construction seasons within Sacramento County would be $222,936. Detailed fee calculations for fees to be paid to SMAQMD, by proposed construction year, are presented in **Appendix F**, Table 22, of this FEIS/FEIR.

The last bullet of Mitigation Measure 4.11-a, "Implement Applicable District-Recommended Control Measures to Minimize Temporary Emissions of ROG, NO_X, and PM_{10} during Construction," of the DEIS/DEIR is revised as follows:

- The project proponent(s) shall pay ~~SMAQMD's off-site construction mitigation fund to further mitigate construction-generated emissions of NO_X that exceed SMAQMD's daily emission threshold of 85 lb/day, for the purpose of reducing impacts to a less-than-significant level. The total mitigation fee for project-related work conducted in Sacramento County during the 2012-2016 construction seasons will be quantified in coordination with SMAQMD using equipment inventories provided by the project proponent(s) prior to construction. Calculation of fees associated with the Phase 4b Project shall be conducted at the time of project approval. The applicable fee rate shall be determined and the total fee shall be calculated based on the fee rate n effect~~

~~at the time of project approval. The fee shall be remitted to SMAQMD before groundbreaking.~~ SMAQMD an off-site mitigation fee for implementation of any proposed alternatives for the purpose of reducing NO_X emissions impacts to a less-than-significant level. Based on the construction information presented in Chapter 2.0, "Alternatives" and the emissions calculations shown in **Appendix F**, if the Proposed Action is implemented, the total estimated fee, including a 5% administrative fee, for elements occurring during the 2012 through 2016 construction seasons within Sacramento County would be $222,936. The fee calculation to offset daily NO_X emissions is based on the cost to reduce 1 ton of NO_X at the time when the document is prepared (currently $16,400 per ton). An initial payment, based on 50% of the estimated fee, shall be remitted to SMAQMD before groundbreaking. The final mitigation fee shall be based on contractor equipment inventories provided by the project proponent(s) to SMAQMD and will reconcile any fee discrepancies due to schedule adjustments or increased equipment inventories.

L1-5 Contractor fleet inventories are currently provided to SMAQMD as part of an existing District-recommended mitigation measure adopted by a previous NLIP project phase to demonstrate a 40% reduction of particulate matter (PM) emissions, based on a comparison to the ARB fleetwide average. To date, fleet inventories provided to SMAQMD demonstrate achievement of 60–65% PM reduction when compared to the ARB fleetwide average. Due to the visibility concerns of retrofit equipment, SMAQMD's recommendation for 15% of contracted fleets to install diesel particulate filters (DPFs) is not required, but will be implemented as feasible.

The last bullet of Mitigation Measure 4.11-a, "Implement Applicable District-Recommended Control Measures to Minimize Temporary and Short-Term Emissions of ROG, NO_X, and PM_{10} During Construction," of the DEIS/DEIR is revised as follows:

- When feasible and determined to be necessary, ~~I~~install ARB-certified Level 3 diesel particulate filters (DPF) on ~~a minimum of 15% of the total number of off-road (non-street legal)~~ diesel-powered construction equipment pieces ~~with an engine size equal to or greater than 50 hp throughout the duration of the project. For fleets with six or fewer total applicable equipment pieces, a DPF shall be installed on a minimum of one engine~~. All DPFs shall be kept in working order and maintained in operable condition according to manufacturer's specifications. At the time of writing, a list of ARB-certified Level 3 DPF can be found at http://www.arb.ca.gov/diesel/verdev/level3/level3.htm.

L1-6 The last paragraph of Impact 4.11-d, "Exposure of Sensitive Receptors to Toxic Air Emissions," in the DEIS/DEIR is revised as follows:

As discussed under Impact 4.11-c, above, the RD 1000 pumping plants and City of Sacramento sump pumps to be modified as part of the Adjacent Levee Alternative (Proposed Action) or the Fix-in-Place Alternative would be minor stationary sources of TAC emissions in Sacramento Counties. Diesel-powered backup generators would be used in emergency situations and would be tested monthly. Consequently, diesel PM emissions associated with the modified pump stations would be infrequent. Furthermore, this category of stationary source (i.e., portable equipment), in addition to any other stationary sources that may emit TACs (i.e., dry cleaners), would be subject to FRAQMD and SMAQMD permitting and toxic best available control technology (T-BACT) requirements. If the implementation of T-BACT would not reduce emissions to an acceptable level, then FRAQMD and SMAQMD would deny the required permit for the stationary source (in this case, the diesel-powered backup generators). Therefore,

operation of these stationary sources would not expose sensitive receptors to substantial concentrations of TACs. No other stationary sources of emissions would be associated with any of the action alternatives. Thus, this impact is considered to be **less than significant**. ***(Similar)***

L1-7 Comment noted.

L1-8 The measures included in Mitigation Measure 4.11-a, "Implement Applicable District-Recommended Control measures to Minimize Temporary and Short-Term Emissions of ROG, NO_X, and PM_{10} During Construction," of the DEIS/DEIR would also serve to reduce greenhouse gas emissions. The specific measures listed on page 5-22 of the DEIS/DEIR are not required to be implemented; rather, they are best management practices. The project proponent(s) would implement measures such as these during construction of the Phase 4b Project to reduce greenhouse gas emissions.

L1-9 Comment noted; all projects are subject to SMAQMD rules at the time of construction. The impact discussion and mitigation measures in the DEIS/DEIR require that USACE and SAFCA comply with SMAQMD rules in place at the time of construction.

Re: Response to the Draft EIS/EIR on the Natomas Post-authorization Change Report/Natomas Levee Improvement Program, Phase 4b Landside Improvements Project

Dear Mr. Bassett,

Thank you for the opportunity to comment on the Draft EIS/EIR on the Natomas Post-authorization Change Report/Natomas Levee Improvement Program, Phase 4b Landside Improvements Project. The County of Sutter has the following comments on the proposed EIS/EIR. L2-1

- Plate 2-6 indicates the Triangle Properties borrow area were previously analyzed, while other portions of the document indicate the area is a new source of borrow. Please address this conflict.

- The proposed Triangle Properties borrow area will include an area currently occupied by the Pleasant Grove Cemetery District cemetery. Page 2-57 and Section 4.8 of the environmental document do not contain any discussion of the cemetery or the potential impacts of soil borrow on the cemetery. The County requests the proposed project's impacts on this cemetery be discussed and analyzed in the environmental document and effective mitigation be incorporated. L2-2

- Plate 2-6, Plate 2-13, and various tables in the environmental document indicate the Brookfield borrow site will be reclaimed to managed marsh. In previous discussions with SAFCA, the County understood the site would be reclaimed to agriculture, as rice production. Please be aware that Sutter County Zoning Code Section 1500-1412 requires approval of a development agreement by the Board of Supervisors for the conversion of agricultural land to permanent habitat. L2-3

1130 Civic Center Boulevard, Suite A • Yuba City, CA 95993 • (530) 822-7400 • FAX: (530) 822-7109

Typically, the removal of more than 1,000 cubic yards of material from a site is subject to the requirements of the Surface Mining and Reclamation Act (SMARA). This requires a surface mining permit and reclamation plan to be processed by Sutter County. If SAFCA would like to use this document as a basis for CEQA review for a subsequent surface mining and reclamation plan application, then the EIR needs to specifically address the potential impacts of borrow activities as well. We look forward to working with you to assure that all surface mining and reclamation impacts are properly analyzed and mitigated. Please provide our office with all future notices regarding this project. L2-4

Sincerely,

Douglas G. Libby, AICP
Principal Planner

DL:kf

P:\Planning\Projects - Misc\SAFCA - Howe Rd Landside Improvement Project\County response to EIR.doc

L2-1 To be consistent with the project description, Plate 2-6 is revised in the FEIS/FEIR to show that the Triangle Properties Borrow Area is a new source of borrow for the Phase 4b Project, rather than a previously analyzed source.

L2-2 Under the subheading "Triangle Properties Borrow Area" in Section 2.3.3.4, "Borrow Sites," of the DEIS/DEIR, it is noted that "no demolition of residences or *other non-agricultural uses* (emphasis added) would occur as part of borrow excavation." This paragraph is revised in the FEIS/FEIR to note the existence of the Pleasant Grove Cemetery District cemetery, and to further clarify that no borrow site excavation would take place in or near it. The text is revised as follows:

> The Triangle Properties Borrow Area (**Plate 2-13**) is located to the northeast of the Natomas Basin on the east side of the PGCC. It is bordered on the east by the Union Pacific Railroad. Farmland would be excavated to a depth of up to 6 feet and either reclaimed for rice cultivation or converted to detention basins to store PGCC overflow in the event that the PGCC culverts are removed. No demolition of residences or other non-agricultural uses would occur as part of borrow excavation. Excavation sites within the Triangle Properties Borrow Area would be set back at least 100 feet from existing roads, utilities, ~~or~~ irrigation ditches, as well as residential and other non-agricultural land uses, such as the Pleasant Grove Creek Cemetery District cemetery. The bridges for Howsley, Fifield, Keys, and Sankey Roads would be used as haul routes to bring the borrow material over the PGCC into the Natomas Basin for the construction of the PGCC and north NEMDC. Alternatively, temporary crossings of the PGCC could be constructed with culverts or bridges over the low-flow channel, to provide for off-road hauling.

The following new paragraph is added after the last bullet in Section 3.8, "Cultural Resources," of the DEIS/DEIR to describe the Pleasant Grove Cemetery District cemetery:

> - **CA-Sut-80H (P-51-000080H)**. Located just north of the Sacramento-Sutter County line and just east of the NEMDC this resource consists of a trash scatter that was determined ineligible for listing on the NRHP (EBASCO 1992a, 1992b).
>
> In addition to the resources in the Sutter County portion of the Natomas Basin, the Pleasant Grove Cemetery District cemetery occurs on the northern edge of the proposed Triangle Properties Borrow Area. Although the cemetery is not recorded as a cultural resource, it contains human remains subject to management required under CEQA. The cemetery occurs on the south side of Howsley Road east of the intersection with Pacific Avenue. This resource would be excluded from the footprint of borrow activities.

The last paragraph of Impact 4.8-d, "Potential Discovery of Human Remains During Construction," in Section 4.8, "Cultural Resources," of the DEIS/DEIR is revised as follows:

> Prehistoric human remains have been found at several prehistoric sites in the vicinity of the Phase 4b Project area. Previously unknown buried human remains may be unearthed, damaged, or destroyed during excavation activities associated with project construction and excavation of borrow from the sites identified in Chapter 2, "Alternatives." This work includes construction of levee improvements, seepage remediation, and changes

and improvements to drainage and irrigation infrastructure. Both the Adjacent Levee Alternative (Proposed Action) and the Fix-in-Place Alternative have a high risk of disturbing previously undiscovered human remains because of the extent of ground-disturbing work required for the project. It should be noted that the Pleasant Grove Cemetery District cemetery occurs on the northern edge of the proposed Triangle Properties Borrow Area. Although the cemetery is not recorded as a cultural resource, it contains human remains subject to management required under CEQA. The cemetery occurs on the south side of Howsley Road east of the intersection with Pacific Avenue. This resource would be excluded from the footprint of borrow activities. Therefore, the Proposed Action would not affect human interments in the cemetery. However, because of the sensitivity for buried human remains in the areas where ground-disturbing work would occur~~.~~, this impact is considered **potentially significant**. ***(Similar)***

L2-3 Comment noted. Development agreement approvals will be obtained as necessary.

L2-4 The California Surface Mining and Reclamation Act (SMARA) permitting is described in Section 3.4.1.1, under "California Surface Mining and Reclamation Act," of the DEIS/DEIR and is also addressed by Mitigation Measure 4.4-a(2), "Secure and Implement the Conditions of the California Surface Mining and Reclamation Act Permit or Exemption," in the DEIS/DEIR. The environmental impacts of borrow site excavation, including at sites that would be located within the Triangle Properties Borrow Area, have been addressed throughout the DEIS/DEIR. Table 2-23 in the DEIS/DEIR describes the size and depth of the area that would be excavated and the proposed postreclamation use. Agricultural impacts are addressed in Section 4.2, "Agriculture," of the DEIS/DEIR. Hydrology, Water Quality, Biological Resources, Cultural Resources, Transportation and Traffic, Air Quality, and Hazards and Hazardous Materials impacts of borrow site excavation are addressed in Sections 4.5, 4.6, 4.7, 4.8, 4.10, 4.11, and 4.16, respectively, of the DEIS/DEIR.

Part 1 - Project Description

Page 2-24 says "To comply with USACE vegetation guidance, all vegetation would be cleared at least 15 feet from the landside toes of the improved levees." The removal of heritage trees within the city must be done in accordance with the City of Sacramento heritage tree ordinance, including the proper mitigation of lost resources. Mitigation shall be coordinated with Urban Forest Division of the Department of Transportation. L3-1

Page 2-25 says "Construct a bicycle and pedestrian trail along the 42-mile loop of the Natomas Basin levee perimeter in the northwestern portion of the County of Sacramento, southern portion of Sutter County, and a portion of the City of Sacramento (program-level analysis only, because site specific details are not available)..." The environmental document should clarify that the actual construction of the finished paved bike and pedestrian trail is not necessarily funded. In this context, the City of Sacramento would like to request that a portion of the proposed trail be constructed through a contribution of funds from the City. This trail segment is on Reach 20, Sta. 940+00 to Sta. 955+00. The City of Sacramento would like to provide the additional funds for paving the proposed bike trail at the top of the levee along this segment. This would include the cost of paving the east leg of the ramps at Sta. 940+00. By including the paving of this segment of bike trail, a vital link in the City's off street bike trail system can be established connecting Natomas to the American River Parkway.

L3-2

Page 2-31 thru 2-32 says "Where cutoff wall construction occurs through the crown of the adjacent levee, some reconstruction work on Garden Highway would be required to restore the landside lane of the roadway. Garden Highway intersections at major roadway ramps would require degrading, rebuilding the embankment, and repaving to accommodate the installation of the cutoff wall and slope flattening. Traffic control and detours would be required during this phase of construction..." Will the repaving of the Garden Highway involve bringing the street up to city standards, including elements that would make the street more complete as outlined in the City's General Plan? At the very least, when this L3-3

segment of road is re-paved, the City of Sacramento would like to review and approve the striping plans to see if an additional eastbound bike lane can be striped within the existing roadway width. L3-3 (Con't.)

Page 2-31 says "Garden Highway intersections at Natomas Park Drive, Truxel Road, Arden-Garden Connector, Northgate Boulevard, and four additional private parcel ramps would require degrading, rebuilding the embankment, and repaving to accommodate the installation of the cutoff wall and slope flattening. The ramps would be reconstructed to the current general ramp and intersection geometry..." At Reach 4, Sta. 100+00, the Garden Highway runs past the Niños Parkway. Will there be an access ramp to the open space as part of this project? If so, can the ramp be made so that it one day can become a bike trail access point to the Niños Parkway? L3-4

Page 2-53 and a similar paragraph on page 2-55 says "To facilitate raising of the pump discharge pipes, the existing bike trail would require a local raise in grade over the pipes. The trail raise would transition back down to existing grade upstream and downstream of the local raise. This work would require partial regrading of the waterside slope for the length of the raised bike trail. At this site, the levee would be degraded and reconstructed with engineered fill. A detour or closure of the bike trail would be required for up to 30 days…" Will the bike trail be reconstructed to meet current city standards? L3-5

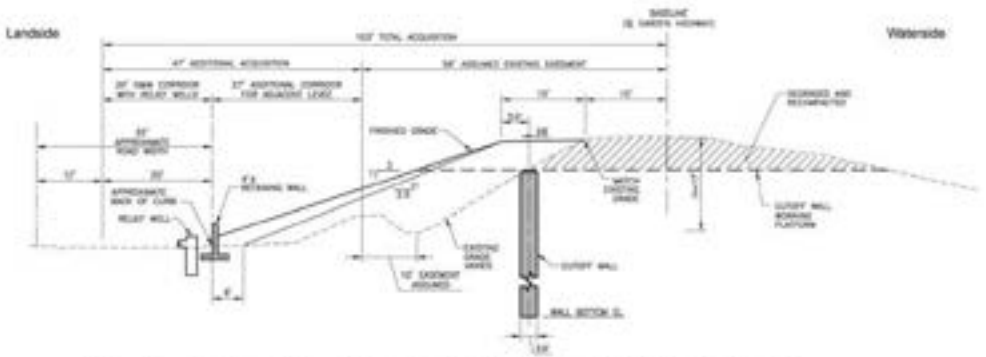
Page 2-53 says "The bike trail would be funded locally, separate from this project." Will there be an opportunity for the City of Sacramento to contribute funds to the project to construct a portion of the trail? L3-6

Page 2-53 says "Where a Class I bike trail cannot be constructed because of physical constraints, the bikeway would be designed to exceed or meet the minimum standards for a Class II facility (a lane set aside in city/county streets exclusively for bikes)." Will the process of delivering this project include an opportunity to work with City and County representatives to plan the locations of these locations? L3-7

Page 2-67 says "Because of the requirement to have newly constructed levees settle prior to final inspection and certification, trail construction in these areas would not occur until the following year's construction season, at the earliest. In addition, the long lead time in securing funding sources could delay construction for several years after completion of levee construction." Would this apply to the segment of bike trail on Reach 20, Sta. 940+00 to Sta. 955+00 where the levee is going to be regarded and repaved for the Garden Highway? L3-8

Part 2 - Plates

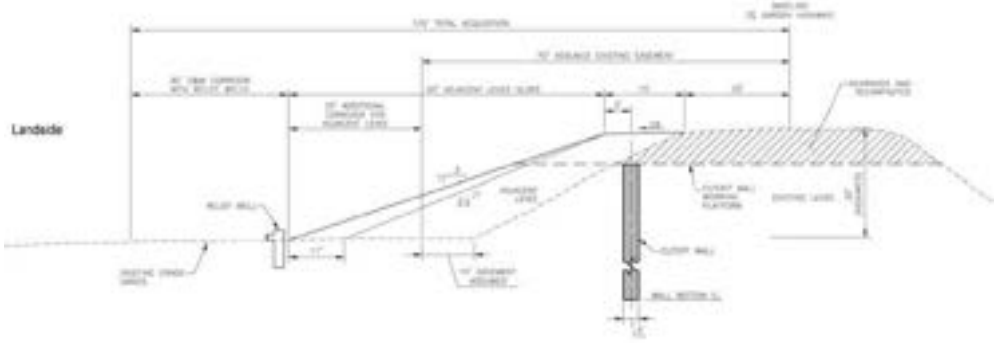
Page 2-101: The cross section on this page does not indicate the existing bike and pedestrian trail that is at the toe of the levee which will be covered over as a result of the project. L3-9



Adjacent Levee Section – Reaches 19B (partial) – 3:1 to 2.5:1 Slope with Cutoff Wall and Relief Wells

Page 2-103: The cross section on this page does not indicate the existing bike and pedestrian trail that is at the toe of the levee which will be covered over as a result of the project. In addition, this section shows a half width of Garden Highway at 20 feet. The crown of the Garden Highway actually varies in size, making the half width as much as 26 feet. Are we to make the assumption that the placement of the adjacent levee will be 15 feet to the north of the existing hinge point of the levee, or will it be set at 20 feet from the centerline of the Garden Highway?

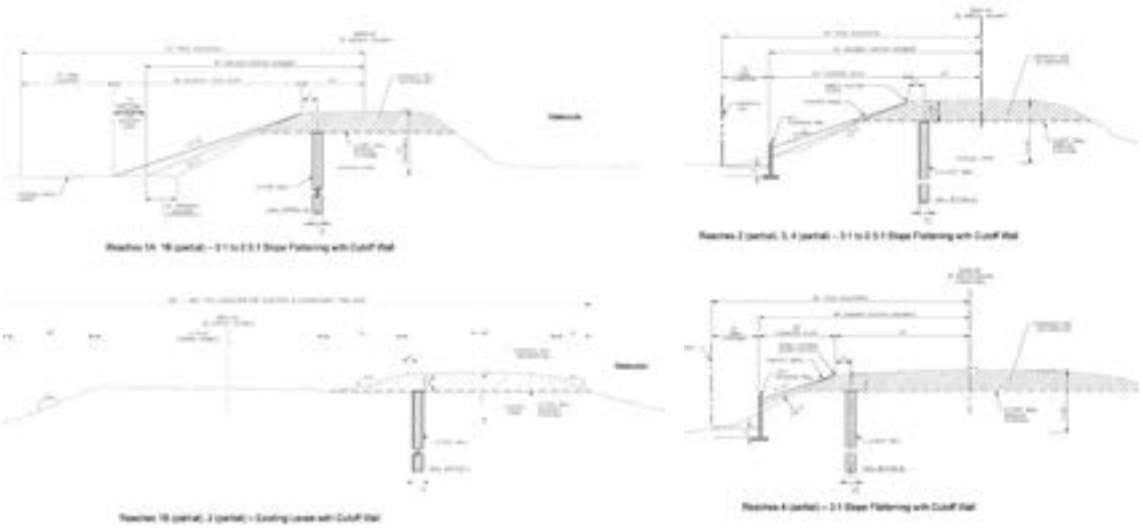
L3-10



Adjacent Levee Section – Reaches 19B (partial), 20 – 3:1 to 2.5:1 Slope with Cutoff Wall and Relief Wells

Pages 2-107 and 2-109: The cross sections on these pages do not indicate the existing bike and pedestrian trail that will be removed and presumable replaced as a result of the project. In the areas between Natomas Park Drive and Northgate Boulevard, will the future bike trail be on the north or south side of the Garden Highway?

L3-11



Part 4 – Impacts Assessments

In Section 4.10.1.2, The environmental document states that the threshold of significance for transportation related impacts would result in a significant impact related to transportation and circulation if the proposed project, or project alternatives would do any of the following:

- "…substantially increase hazards due to a design feature or incompatible uses;
- result in inadequate emergency access; or
- conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities."

Within this context, this environmental document does not adequately address significant impacts that would result from the construction of the proposed adjacent levee structures. These impacts generally are the loss of existing emergency vehicle access points and the loss of existing pedestrian and bicycle facilities.

Within the City of Sacramento along the Garden Highway between Interstate 80 and Interstate 5, there are at least 2 public streets, 8 property access ramps and 6 emergency access points that connect with the Garden Highway and/or to each other. The proposed project does not show sufficient detail of how these connections will be modified. Based on the information provided, the proposed project will completely eliminate some of the emergency access points. Mitigations for these losses should be provided.

Furthermore, the stretch along the Garden Highway between Interstate 80 and Natomas Park Drive has at least 4 existing bike and pedestrian facilities that will be affected. The proposed project does not indicate what will happen to these facilities. Using the information provided about the proposed project, the loss of existing bike and pedestrian facilities is anticipated. Mitigations for these losses should be provided. L3-12

Details of these impacted areas are as follows:

1. Reach 19B, Sta. 879+00 to Sta. 885+00; there are two emergency access ramps at this location which provide access to the cul-de-sacs streets called Avocet Court and Marina Glen Way. The construction of the proposed project will require some re-alignment of these ramps to allow continued emergency vehicle access. These access ramps also function as bike and pedestrian access ramps. Construction of the re-aligned ramps should comply with accessibility standards. The ramp to Marina Glen Way may require a retaining wall structure as mitigation. The construction of the proposed project will also interfere with the existing pedestrian walkway along the end of Marina Glen Way. The existing sidewalk should not be impacted, and proper mitigation, such as the inclusion of a retaining wall should be included.

2. Reach 19B, Sta. 883+00 to 892+00; there is a bike and pedestrian facility along Swainson Way/Avocet Court between the street curb and the toe of the levee. The construction of the proposed project will place the levee on top of this facility, rendering it unusable and disconnected from Shorebird Park. Mitigation for the loss of this facility must be provided. One option for mitigation would be the construction of the proposed bike trail at the top of the levee. If this is done, part of this mitigation should include connectivity to Shorebird Park near Sta. 892+00.

3. Reach 19B, Sta. 892+00 to Sta. 895+00; the existing pedestrian pathways within Shorebird Park run along the toe of the levee. The construction of the proposed project will place the levee on top of these pathways, rendering them unusable. Mitigation for the loss of these pathways must be provided. One option for mitigation would be the reconstruction of these pathways in a similar location and layout, but at a higher elevation. This could also be an opportunity to create connectivity to the proposed bike trail at the top of the levee.

L3-12 (Con't.)

4. Reach 19B, Sta. 895+00; there is an elevated concrete structure adjacent to the Garden Highway that is associated with City Pump Station 160. The size and location of this structure appears to be in conflict with the location of the proposed bike trail at the top of the levee. While it is understood that the proposed project does not normally include the construction of this proposed bike trail, should this trail be selected as mitigation for the impact identified previously, the design of this trail should look at ways to coordinate with the pump station structure. This could be an opportunity to connect to the pedestrian pathways in Shorebird Park.

5. Reach 19B, Sta. 913+00 to 917+00; this area includes the intersection of Orchard Lane and Garden Highway and an emergency vehicle access/bike and pedestrian facility connecting Durazno Court to La Lima Way. The proposed project does not appear to significantly change the intersection at Orchard Lane; however there will likely be impacts during the construction. Appropriate detours and construction phasing for this intersection would be required. The proposed project will place the levee on top of the emergency vehicle access between Durazno Court and La Lima Way. The loss of this access-way must be mitigated. The proper mitigation for this impact would be the construction of an alternative access-way which will provide adequate emergency vehicle access and maintain bike and pedestrian connectivity between these streets. One option would be to construct ramps from the new proposed bike trail at the top of the levee to the two streets below.

L3-12
(Con't.)

6. Reach 20, Sta. 929+00; there is a traffic channelization island and an emergency access road at this location. The size and location of this structure appears to be in conflict with the location of the proposed bike trail at the top of the levee. While it is understood that the proposed project does not normally include the construction of this proposed bike trail, evaluation for the need for the continued use of this channelization island should be considered. Additionally, there is an existing emergency access road at this location. It does not appear that the propose project will require a modification of this access road, since it already ties into a wide part of the existing levee. The environmental document should verify that there is no impact at this location.

7. Reach 20, Sta. 929+00 to Sta. 940+00 and at Sta. 945; there is an existing bike and pedestrian trail near the toe of the levee. The construction of the proposed project will place the levee on top

of or near the edge of these pathways, rendering them unusable. Mitigation for the loss of is trail must be provided. One option for mitigation would be the reconstruction of this trail in a similar location and layout, but at a higher elevation. This could also mitigated by using the alternative 2.5:1 slope for the levee. Another alternative could be the installation of a retaining wall.

8. Reach 20, Sta. 949+00; there is a property access ramps to the Garden Highway at this location. This ramp is currently used as an unpaved footpath. The construction of the proposed project will require a re-alignment of this ramp to allow continued access to the City Park property and the existing nature trail further north. The proper construction to appropriate standards for these ramps should be part of the mitigation plan.

9. Reach 1A/1B and Reach 2, Sta. 0+00 to Sta. 37+00; there is an existing bike trail along the top of the levee for this segment. The construction of this project should replace the bike trail according to current standards.

L3-12 (Con't.)

Suggested Mitigations

1. Reach 19B, Sta. 879+00 to Sta. 885+00; To address several impacts, the City is suggesting that the proposed bike trail at the levee top be implemented for this segment. At the west end, the ramps to the cul-de-sac streets would be reconstructed, the trail would have a new ramp into Shorebird Park. The walkways within the park could be elevated to tie-in with the trail. To avoid the pump station structure, the trail would run along the north of it.

2. Reach 19B, Sta. 913+00 to 917+00; Since the construction will cut off the access to Durazno Court, one form of restoring emergency access would be to provide a new ramp up to the Garden Highway.

L3-12
(Con't.)

L3-1 Comment noted. As detailed project design develops, the project proponent(s) will coordinate with the City of Sacramento as appropriate.

L3-2 The description of the Natomas Levee Class 1 Bike Trail Project on page 2-25 of the DEIS/DEIR is only a brief summary in a list of project components. The full description is located in Section 2.3.4.7, "Natomas Levee Class 1 Bike Trail Project," of the DEIS/DEIR where it is noted that the bike trail would be funded locally, separate from the Phase 4b Project. The description also notes that the DEIS/DEIR provides only program-level environmental analysis of the bike trail component. Detailed design, including a specific route, has not been developed. Site-specific environmental review will be conducted once detailed design is available.

L3-3 The extent to which levee construction would affect Garden Highway, such that it would require reconstruction, would be determined during final design. The decision of how to reconstruct Garden Highway will be determined in conjunction with local jurisdictions and non-Federal sponsors.

L3-4 The DEIS/DEIR addresses the potential environmental impacts of a worst-case levee improvement footprint based on preliminary design. Detailed engineering specifications would be developed during final design and coordinated with the City of Sacramento.

L3-5 See response to comment L3-3. Mitigation Measure 4.13-c(1), "Prepare and Implement a Bicycle Detour Plan for All Bicycle Trails and On-Street Bicycle Routes, Provide Detours for Bicycle Facilities, and Coordinate with City and/or County Departments of Parks and Recreation to Repair of Damage to Recreational Facilities," in the DEIS/DEIR requires coordination with the City of Sacramento to restore access and repair or reconstruct any construction-related damage to bicycle facilities.

L3-6 Sacramento County is the project proponent for the Natomas Levee Class 1 Bike Trail Project and would be responsible for coordinating design and funding for this component.

L3-7 See response to comment L3-6.

L3-8 If the commenter refers to the existing bike trail, which is located at the landside toe of the levee, reconstruction of the bike trail would likely occur at the toe of the levee but would be determined during final design of this component of the Phase 4b Project. If the commenter is referring to the proposed Natomas Levee Class 1 Bike Trail Project, the exact route would be determined during detailed design of that project.

L3-9 The cross sections shown in Plates 2-8a through 2-8d of the DEIS/DEIR are not intended to show existing conditions, but rather to provide examples of typical levee design in these levee segments. Existing infrastructure affected by construction would be replaced in kind.

L3-10 See responses to comments L3-4 and L3-9.

L3-11 See responses to comments L3-4 and L3-9.

L3-12 The DEIS/DEIR addresses temporary and short-term disruption of emergency service response times and access in Impact 4.10-c, "Temporary and Short-Term Disruption of Emergency Service Rees Times and Access," of the DEIS/DEIR. Implementation of Mitigation Measure 4.10-a, "Prepare and Implement a Traffic Safety and Control Plan for Construction-Related Truck Trips," of the DEIS/DEIR bullet (f) would ensure coordination with the City of Sacramento regarding the timing of specific road closures that would affect access for emergency vehicles. See response to comment L3-3 regarding reconstruction of roadway intersections. Detailed engineering specifications for reconstructing roadways will be developed during final design.

Table 4.13-1 in the DEIS/DEIR identifies temporary impacts to bike trails from project construction. Mitigation Measure 4.13-c(1), "Prepare and Implement a Bicycle Detour Plan for All Bicycle Trails and On-Street Bicycle Routes, Provide Detours for Bicycle Facilities, and Coordinate with City and or County Department of Parks and Recreation to Repair of Damage to Recreational Facilities," of the DEIS/DEIR requires a bicycle detour plan to reduce impacts to temporary closure of bicycle facilities and coordination with the City of Sacramento to restore access and repair or reconstruct any construction-related damage to bicycle facilities. Detailed engineering specifications for reconstructing bike facilities will be developed during final design.

Re: DEIS/DEIR American River Watershed Common Features Project/Natomas Post-Authorization Change Report/Natomas Levee Improvement Program, Phase 4b Landside Improvements Project.

Dear Mr. Bassett and Ms. Holland,

The Feather River Air Quality Management District (District) appreciates the opportunity to provide comments on the above referenced project. The District has reviewed the project and has the following comments:

- In Table 3.11-1 on page 3-100, under the Yuba City-Almond Street Monitoring Station section, only State Maximum 24-hour $PM_{2.5}$ concentrations have been reported. The State does not have a 24-hour $PM_{2.5}$ ambient air quality standard (AAQS). The State AAQS is an annual average not to exceed 12 $\mu g/m^3$. The District recommends adjusting the table to clarify the $PM_{2.5}$ State annual average AAQS (12$\mu g/m^3$) and the National 24-hour AAQS (35 $\mu g/m^3$) and annual average AAQS (15.0 $\mu g/m^3$), which is reported accurately in Table 3.11-2 on the following page. L4-1
- In Table 3.11-2 on page 3-101, south Sutter County and Sacramento County should have the same nonattainment status for the National 8-hour ozone AAQS as they both included in the Sacramento Federal Nonattainment Area. Table 3.11-2 states that the attainment status for Sutter County is Severe Nonattainment and Sacramento County is Serious Nonattainment. L4-2
- Also on Table 3.11-2 on page 3-101, the National 1-hour AAQS for nitrogen dioxide was adopted on January 22, 2010. The new standard is 0.100 ppm. L4-3

- As an alternative to the mitigation measure listed in the last bullet on page 4.11-16, the District has authorized an additional 20% PM reduction in project wide fleet-wide averages in lieu of 15% DPF's required on off-road construction equipment. L4-4

If you need further information or assistance, please contact me at (530) 634-7659 x210. Air District staff will be available to assist the project proponent or Lead Agency as needed.

Sincerely,

Sondra Andersson

Sondra Andersson
Air Quality Planner

Enclosures: None

File: Chron

L4-1 Table 3.11-1 in the DEIS/DEIR is revised to clarify that the California Ambient Air Quality Standards (AAQS) for fine particulate matter with an aerodynamic diameter of 2.5 micrometers or less ($PM_{2.5}$) is based on an annual average (not to exceed 12 $\mu g/m^3$); and the National $PM_{2.5}$ AAQS is based on a 24-hour and annual average. See revisions in **Appendix F** to this FEIS/FEIR.

L4-2 Table 3.11-2 in the DEIS/DEIR is revised to indicate that the National 8-hour ozone nonattainment designation for both south Sutter County and Sacramento County is "Severe-15" Non-attainment, effective June 4, 2010 for Sacramento Metropolitan areas per EPA-R09-OAR-2008-0467; FRL-9141-8. See revisions in **Appendix F** to this FEIS/FEIR. The Feather River Air Quality Management District (FRAQMD) suggested that the designation be updated to reflect a "serious" non-attainment designation; however, the current Federal non-attainment designation is "Severe-15."

L4-3 The National 1-hour nitrogen dioxide (NO_2) standard provided in Table 3.11-2 in the DEIS/DEIR is updated to 0.100 parts per million (ppm), as adopted on January 22, 2010. See revisions in **Appendix F** to this FEIS/FEIR.

L4-4 See response to comment L1-5.

Subject: *Draft Environmental Impact Statement/ Draft Environmental Impact Report on the American River Watershed Common Features Project/ Natomas Post-authorization Change Report/ Natomas Levee Improvement Program, Phase 4b Landside Improvements Project*

Dear Ms. Holland:

Thank you for the opportunity to review the *Draft Environmental Impact Statement (DEIS) and Environmental Impact Report (DEIR)* for these important flood control projects. We are pleased that these levee improvements are in the process of being implemented; this is a very important project for the entire region.

The City of Sacramento Department of Parks and Recreation is responsible for the management of all parks and off-street bikeways within the City of Sacramento. A letter has been submitted separately from the City of Sacramento Department of Transportation concerning impacts to the City's existing and planned off-street bikeways. We did not want to duplicate those comments, but support them as they relate to the City's off-street bikeway system. Our comments provided below focus on impacts to City parks. L5-1

The City of Sacramento owns and manages thirteen neighborhood and community parks or regional parkways within or near the Phase 4B Project Area. All will be impacted in the short term and/or long term under the various alternatives identified in the report. From our preliminary calculations, it appears that the overall impact to the park system serving the South Natomas Community Plan Area would total about six (6) acres, with the greatest impact occurring at the Costa Park Site.

The following comments are offered:

Page 4.7-8, Adjacent Levee Alternative (Proposed Action), Long-Term and Permanent Impacts Due to Loss of Landside and Waterside Woodland and Shaded Riverine Aquatic Habitats, 1st Paragraph: L5-2
The last sentence mentions the planting of native trees to create woodland habitat along the Lower Dry Creek immediately east of NEMDC. Any plantings of mitigation trees at this location, also known as Hansen Ranch, will need to consider affects to the long term development plans for this site since mitigation trees would need to be protected thereafter.

Page 4.13-3, No Action Alternative, No Phase 4b Project Construction. 1st Paragraph:
In order to gain an understanding of the magnitude of the impact on heritage trees in the affected City parks, a survey of the affected areas should be conducted.

The United States Army Corps of Engineers (USACE) will need to follow Sacramento City Code Chapter 12.64 Heritage Trees, including pulling necessary permits for the removal of Heritage Trees. Language should state that USACE will identify each tree that qualifies for Heritage Tree status through a survey. In regards to the Heritage Trees that are being targeted for removal, mitigation will be based on diameter inches at a 1 to 1 replacement ratio. Therefore, if a 24 inch diameter Heritage Tree is removed than 24 diameter inches of new trees will be the replacement. In addition the Army Corps of Engineers will be required to maintain the new trees during the first 3 year establishment period, and longer if planted under difficult cultural conditions. You may need to contract with a third party maintenance provider for the work, like the Tree Foundation (http://www.sactree.com/). L5-3

Page 4.13-3, Adjacent Levee Alternative (Proposed Action), 2nd Paragraph:
See comments above regarding Sacramento City Code Chapter 12.64 on Heritage Tree removal.

Page 4.13-11, Fixed-in-Place Alternative, Mitigation Measure 4.13-b: Compensate City of Sacramento Department of Parks and Recreation for Loss of Parkland and Park Amenities:
The City will work with SAFCA and USACE staff to find suitable alternatives to compensate for parkland loss, preferably in the form of additional parkland within the South Natomas Community Planning Area. Where manmade amenities are impacted, including irrigation systems, play structures, walkways, landscaping, or other associated features, we will expect that funds will be made available for the redesign and reconstruction of the impacted parks under the direction of the City of Sacramento Department of Parks and Recreation. In addition, at the appropriate time, USACE and Sacramento Area Flood Control Agency (SAFCA) will need to obtain all necessary property rights (rights of entry or temporary or permanent easements) prior to conducting any work on any of the parks. L5-4

Page 4.13-4, Table 4.13-1, Bannon Creek Nature Preserve, Permanent Impacts:
Both the Adjacent Levee Alternative and the Fix-in-place Alternative will encroach 50 feet into the Bannon Creek Nature Preserve causing the loss of Heritage Oak Trees. See comments above regarding Sacramento City Code Chapter 12.64 on Heritage Tree removal. (See attached aerial photo) L5-5

Page 4.13-4, Table 4.13-1, Costa Park Site (Park Site SN2), Permanent Impacts:
Both the Adjacent Levee Alternative and the Fix-in-place Alternative propose the construction of an adjacent levee, seepage berm and utility corridor that would encroach 280'-290' into the park site making any future park use unfeasible, which is a more than significant impact. Can park amenities be built on top of the seepage berm or can the USACE mitigate the impact by providing equivalent park acreage within ½ mile of the park site? In addition, there is no mention of the existing building on the site and how the elimination of that building will be mitigated. In order to investigate if park features can be built on top of the seepage berm we need to know: 1) what is the slope of the seepage berm?; and, 2) can a park be placed on top of the seepage berm as an approach to co-locate the park on the property and fully utilize the entire park acreage? Are there other alternatives to the seepage berm that would not render this park site undevelopable? (See attached aerial photo) L5-6

Page 4.13-6, Table 4.13-1, Garden Land Park, Permanent Impacts:
Both the Adjacent Levee Alternative and the Fix-in-place Alternative propose expansion and/or relocation of the City of Sacramento Sump Pump 102 at this park site. This will have substantial impact on the usability of this park and more information is needed as to where and when the USACE is proposing to relocate the Sump Pump and to what extent it will be expanded. This information is essential to understand the full impact to the park site. Timing is especially important because we are scheduled to construct park improvements in June 2011 and we would not want to construct improvements that would conflict with the Sump Pump expansion/relocation. Can this sump pump be moved off of the park site altogether? If the sump pump will be moved within the park site, can it be moved to the northeast or southeast corner of the site for better utilization of the park? (See attached master plan) L5-7

Page 4.13-7, Table 4.13-1, Natomas Oaks Park, Permanent Impacts:
Both the Adjacent Levee Alternative and the Fix-in-place Alternative propose 50 to 70 foot encroachments L5-8

into the park, which will cause the loss of approximately 5-7 Heritage Oak Trees. See comments above regarding Sacramento City Code Chapter 12.64 on Heritage Tree removal. In addition there is an unpaved access ramp that slopes down into the natural preserve which will need to be rebuilt and maintained for access. Also, the improvements at this Park Site where funded by the Federal Land and Water Conservation Grant Program subject to Section 6(f)3 protections and shall not be converted to other than public outdoor recreation use without the approval of the U.S. Secretary of the Interior. (See attached master plan) L5-8 (Con't.)

Page 4.13-7, Table 4.13-1, Ninos Parkway, Permanent Impacts:
Both the Adjacent Levee Alternative and the Fix-in-place Alternative proposal would encroach into the southern edge of the Ninos Parkway. If community garden plots are permanently affected, how will encroachment be mitigated? Will the USACE mitigate the impact by providing equivalent park acreage somewhere else within the SN Community Plan Area? Since the City's Bikeway's Master Plan calls for a bike trail connection between Ninos Parkway and Garden Highway using an off-street bike ramp, can one be built as part of the mitigation measure for encroaching into the Ninos Parkway? (See attached master plan) L5-9

Page 4.13-8, Table 4.13-1, Sand Cove Park, Permanent Impacts (Fix-in-Place Alternative):
In 2007, USACE, Sacramento District, City of Sacramento, Reclamation District 1000 and SAFCA completed bank protection measures to prevent ongoing streambank erosion and resource vandalism at this location. Any work at this site will need to avoid any impacts to this recently completed project. (See attached master plan) L5-10

Page 4.13-8, Table 4.13-1, Shorebird Park, Permanent Impacts:
The Adjacent Levee Alternative will encroach 50 feet into the park, causing impacts to irrigation lines, concrete walkways, landscaping, berms and lawns. Redesign of the park will be necessary to redevelop the public amenities and reconfigure the irrigation system, which need to be funded. This work shall be considered a part of the compensation for impacts to the park. Also, will a "utility corridor" consume additional park acreage? Are you proposing a "utility corridor" abutting the new landside toe the levee? What is allowed in a "utility corridor"? Can landscaping be planted abutting the new landside toe of the levee or are there restrictions? (See attached master plan) L5-11

Page 4.13-10, Table 4.13-1, Ueda Parkway, Permanent Impacts:
See comments above regarding Sacramento City Code Chapter 12.64 on Heritage Tree removal. L5-12

I am also attaching the Park Master Plan and aerial photographs for each of park sites impacted in order to give a better understanding of the site and the potential disturbance to park features.

Again thank you for the opportunity to review this document. My staff and I look forward to working with you on this project and want to speak further about project specifics. Areas of further discussion include identifying developable parkland to compensate the loss of parkland in the South Natomas Community Plan Area, location of heritage trees mitigation, mitigation of impacted park amenities, processing of property rights, and rebuilding of access ramps. I am available to meet to further discuss these concerns and questions. You can contact me at 916-808-1955 or Raymond Costantino at 916-808-8826 to arrange a meeting. L5-13

Sincerely,

J.P. Tindell
Park Planning & Development Manager

Shorebird Park Master Plan

MASTER PLAN FOR:

SHOREBIRD PARK 2 Acres

R2003-845

12/2/2003

L5-1 See responses to comment letter L3 and see responses to comments L5-2 through L5-12.

L5-2 Section 2.3.4.2, "Woodland Compensation," of the DEIS/DEIR states that Hansen Ranch is a 420-acre open space area located north of Main Avenue and east of the NEMDC. This area consists of Hansen Park, owned by the City of Sacramento, and the Coyle Property, which is owned by SAFCA. SAFCA has a conservation easement on Hansen Park (the western portion of the Lower Dry Creek area) that already limits future development of the park. However, the conservation easement does permit habitat enhancements, such as tree plantings.

L5-3 See response to comment L3-1.

L5-4 Mitigation Measure 4.13-b, "Compensate City of Sacramento Department of Parks and Recreation for Loss of Parkland and Park Amenities," in the DEIS/DEIR requires that the project proponent(s) compensate for loss of parkland and amenities.

L5-5 See responses to comment L3-1.

L5-6 The DEIS/DEIR analyzes the environment impacts, including encroachments on park facilities, of a worst-case levee improvement footprint. Mitigation Measure 4.13-b, "Compensate City of Sacramento Department of Parks and Recreation for Loss of Parkland and Park Amenities," of the DEIS/DEIR addresses impacts to park facilities. The actual extent of encroachments by levee improvements on park facilities and the degree to which park facilities may co-locate with flood control facilities, such as seepage berms, would be determined as part of final design.

L5-7 The precise modifications and construction timing for Sump Pump 102 would be determined during final design. To ensure coordination with the City of Sacramento, the following text is added at the end of the 2nd paragraph of Mitigation Measure 4.13-b, "Compensate City of Sacramento Department of Parks and Recreation for Loss of Parkland and Park Amenities," of the DEIS/DEIR as follows:

> The project proponent(s) shall compensate for loss of Heritage trees and native oak trees from within the City of Sacramento's public parks and open space areas. Heritage trees shall be replaced in accordance with Sacramento City Code, Title 12, Streets, Sidewalks and Public Places, Chapter 12.64 Heritage Trees. California native trees shall be replaced with like species. Priority shall be given to replacement plantings within the Natomas Basin on public park land or open space/natural areas accessible to the public. Second priority would be replacement in public park areas of North Sacramento located within the City. <u>Project proponent(s) shall consult with City of Sacramento Department of Parks and Recreation regarding the location of compensatory woodland plantings on City property, including but not limited to the City-owned portion of the Hansen Ranch property.</u>

L5-8 See responses to comments L5-3 and L5-4.

L5-9 Mitigation Measure 4.13-b, "Compensate City of Sacramento Department of Parks and Recreation for Loss of Parkland and Park Amenities," of the DEIS/DEIR addresses impacts to park facilities.

See responses to comments L5-3 and L5-4. As noted in Table 4.13-1 in the DEIS/DEIR, the levee and operations and maintenance (O&M) corridor and utility corridors would encroach onto the southern edge of the garden. Future plans for bikeway connection to Garden Highway shown in the master plan may need to be modified to accommodate adjacent levee. This would be addressed by the project proponent(s) during consultation with the City regarding compensation for loss of park property and amenities as described in response to comment L5-4.

L5-10 Comment noted. As described in the DEIS/DEIR, the Adjacent Levee Alternative (Proposed Action) would have no impact on the waterside levee at Sand Cove Park. The Fix-in-Place Alternative would remove vegetation, but would not disturb the waterside levee.

L5-11 The location of the utility corridor will be determined during final design, in coordination with the City. Mitigation Measure 4.13-b, "Compensate City of Sacramento Department of Parks and Recreation for Loss of Parkland and Park Amenities," of the DEIS/DEIR addresses impacts to park facilities.

L5-12 See response to comment L5-3.

L5-13 As noted in response to comment L5-4, USACE and SAFCA will coordinate with the City.

Subject: Draft Environmental Impact Report/Draft Environmental Impact Statement for the American River Watershed Common Features Project/Natomas East Levee Improvement Program, Phase 4b Landslide Improvements Project and the Draft Natomas Post-authorization Change Report

Dear Ms. Holland:

The Sacramento Regional County Sanitation District (SRCSD) and Sacramento Area Sewer District (SASD) have reviewed the Draft Environmental Impact Report/Draft Environmental Impact Statement for the American River Watershed Common Features Project/Natomas East Levee Improvement Program, Phase 4b Landslide Improvements Project and the Draft Natomas Post-authorization Change Report and have the following comments:

SRCSD currently has critical facilities in operation that serve the entire Northern Sacramento region which are located in the proposed project area. The New Natomas Sewerage Pump Station Force Main crosses under the Sacramento River, near Interstate 80, the Old Natomas Force main is located near the intersection of San Juan and East Levee Road, and The Upper Northwest Interceptor (UNWI) is located near the intersection of Elkhorn Blvd. and East Levee Road. L6-1

There needs to be close coordination with SRCSD during the design and construction phases for projects within the vicinity of these interceptors to ensure that this project does not adversely affect these facilities.

If you have any questions regarding these comments, please contact me at (916) 876-9994.

Sincerely,

Sarenna Deeble
SRCSD/SASD

RE: Draft EIS/EIR on Phase 4b of the Natomas Levee Improvement Program

Dear Mr. Bassett:

Thank you for the opportunity to comment on the subject Draft EIR/EIS. We continue to be very pleased that the Phase 4b Project DEIR/EIS provides for the possible construction of the Natomas Levee Recreational Trail Project, a 42-mile bicycle and pedestrian Class I facility. However, we fear that many years may pass before actual construction of this trail may even start, let alone be completed and usable for either recreation or commuting. O1-1

The Draft EIR/EIS properly acknowledges that construction of the project will cause temporary (up-to-6-month) disruptions of roadways and trails used by bicyclists and commits to preparation and implementation of Bicycle Detour Plans for each such disruption.

The Draft EIR/EIS fails to identify possible significant adverse impacts of long-term or indefinite interruption of bicycle facilities. Such long-term impacts may occur if the NLIP does not commit to completely reconstruct existing bicycle facilities that are destroyed by construction excavation or filling. These significant adverse impacts may occur at the following locations of existing bicycle facilities (see City of Sacramento Bikeway Master Plan map dated April 2010): O1-2

1. Garden Highway along the American River levee and the lower portion of the Sacramento River levee (to Orchard Lane) where it currently has Class II bicycle lanes,

2. Class I Bike Trail at foot of Sacramento River levee westward from Natomas Oaks Park to the Main Drainage Canal Class I bike trail (this trail is currently an important commuter route from South Natomas towards downtown and will become much more important when the bike bridge over I80 to North Natomas at the junction of the Main Drainage Canal and the East and West Drainage Canals and their Class I bike trails is completed in 2011),

3. Class I Bike Trail at foot of Sacramento River levee westward from Shorebird Park to Marina Glen Way with connections up the slope of

the levee to Garden Highway (an important route for commuters from the western portion of South Natomas), and

4. Ueda Parkway Class I bike trail along the top of the Natomas East Main Drainage Canal west levee (an important commuter and recreational bicycle route between North Sacramento, North and South Natomas, and downtown).

O1-2 (Con't.)

These significant adverse impacts can be reduced to less than significant levels by the commitment of the NLIP 4b project to fully reconstruct and reestablish these important bicycle facilities and connections.

To fully mitigate temporary construction disruptions to bicycle routes, the Bicycle Detour Plans must include (in addition to what is stated in the DEIR/EIS) the following measures:

- Noticing of alternate routes for bicyclists to local bicycle organizations for distribution through their information channels, and
- 25 mph speed limits through the detours.

The Ueda Parkway bike trail currently has limited connections with surface streets in the neighborhoods near which it passes. Reconstruction of the Ueda Parkway bike trail after completion of the levee project should include establishing connections (possibly by paving construction-access ramps) to the following surface streets:

O1-3

- Indiana Ave
- Senator Ave
- Rosin Court
- Tandy Court
- North Market Blvd

SABA is an award-winning nonprofit organization with more than 1400 members. We represent bicyclists. Our aim is more and safer trips by bike. We are working for a future in which bicycling for everyday transportation is common because it is safe, convenient, and desirable. Bicycling is the healthiest, cleanest, cheapest, quietest, most energy efficient, and least congesting form of transportation.

Thank you for considering our comments.

Yours truly,

Matt Seubert for

Jordan Lang
Project Assistant

Cc: Ed Cox, City of Sacramento Alternate-Modes Coordinator
Dan Klinker, Sacramento County Bicycle Coordinator

O1-1 Comment noted.

O1-2 Table 3.13-1 is revised as follows:

Table 3.13-1
Recreational Facilities and Park Lands in the Natomas Basin, including the Phase 4b Project Area

Facility (Owner/Operator)	Location	Features
Garden Highway Bikeway	Reach I:1–2 of the American River north levee and Reach A:19B and 20 of the Sacramento River east levee. The Class I bikeway is adjacent to Garden Highway, on the waterside of the levees between Natomas Park Drive and Gateway Oaks Drive. The trail crosses Garden Highway, enters the Natomas Oaks Park, and continues parallel to the levee on the landside to the NEMDC. The bikeway turns north at this point and follows the NEMDC. See **Plate 2-21**, "Bike Trail Concepts"	1.25-mile trail from Natomas Park Drive to Natomas Main Drainage Canal
Ueda Parkway (City of Sacramento Department of Parks and Recreation)	On the crown of NEMDC west levee between Arden Garden Connector and Elkhorn Boulevard, Dry Creek, and Robla Creek	12.5 miles of paved recreation trails primarily on levee crowns, providing access to the natural habitat of Steelhead, Arcade, Dry, and Robla Creeks. The parkway also has approximately 3.5 miles of equestrian trail in the Hansen Ranch area, which includes Dry Creek, Robla Creek, wetlands, and oak woodlands. Provides a connection to American River Parkway and downtown Sacramento, with neighborhood access points at various locations; facilities include a Class I bike trail along the crown of the NEMDC

Table 4.14-1 is revised as follows:

Table 4.13-1
Impacts to Recreational Facilities and Park Lands In or Near the Phase 4b Project Area

Facility (Owner/Operator)	Location	Park Amenities	Temporary and Short-term Impacts	Permanent Impacts
Ueda Parkway (City of Sacramento)	On the crown of the NEMDC west levee between Arden-Garden Connector and Elkhorn Boulevard, along Dry Creek, and Robla Creek east of the NEMDC	12.5 miles of paved recreation trails primarily on the levee crowns; connection to American River Parkway and downtown Sacramento; neighborhood access points at various locations; facilities include a Class I bike trail along the crown of the NEMDC	Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative: Erosion repair, waterside repairs, and repairs at City of Sacramento Sump Pump 102 would require temporary closures of the bike trail on the NEMDC levee crown. The bike trail would be demolished at the construction locations and reconstructed.	Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative: Vegetation removal (including potential removal of Heritage oak trees) on the waterside of the west levee of NEMDC south would adversely affect the recreational experiences for passive users (birdwatchers, fisherman, and hikers) of the Parkway.
Garden Highway Bikeway	Waterside of the American River north levee in Reaches I:1 and I:2 and on the waterside and landside of the Sacramento River east levee in Reach A:20	1.25-mile trail from Natomas Park Drive to Natomas Main Drainage Canal; the trail follows the Natomas Main Drainage Canal north from the Sacramento River east levee Reach A:19B and 20	Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative: Portions of the Bikeway located on the levee crown on the south side of Garden Highway on the American River north levee Reach I:1–2 and Sacramento River east levee Reach A:20 would be temporarily affected by construction closures and may need to be reconstructed upon completion of construction.	Adjacent Levee Alternative (Proposed Action) and Fix-in-Place Alternative: In Reach A:20 on the landside of the levee between Natomas Oaks Park and the NEMDC, the Adjacent Levee Alternative (Proposed Action) and the Fix-in-Place Alternative (O&M corridor) would encroach on the Bikeway. Following construction of the Fix-in-Place Alternative, the Bikeway could be replaced in the O&M corridor. Fix-in-Place Alternative: Removal of riparian vegetation and woodlands on the waterside of the Sacramento River east levee in Reach A:20 and American River north levee in Reach I:1–2 would diminish the quality of the recreational experience for users of the Bikeway in these areas.

Mitigation Measure 4.13-c(1), "Prepare and Implement a Bicycle Detour Plan for All Bicycle Trails and On-Street Bicycle Routes, Provide Detours for Bicycle Facilities, and Coordinate with City and/or County Departments of Parks and Recreation to Repair Damage to Recreational Facilities," of the DEIS/DEIR will reduce temporary impacts to bicycle routes to a less than significant level because construction-related damage will be repaired or reconstructed; access restored; and detour routes, roadway markings to designate temporary bike lanes, and informational signs will be provided. Specific details and coordination efforts related to reconstruction of bicycle routes will be determined during final planning, engineering, and design.

To the extent feasible, the reconstructed roadway and any associated bicycle facilities would meet City of Sacramento or Sacramento County roadway design criteria, depending on the jurisdiction.

O1-3 As described above in response to comment O1-2, implementation of Mitigation Measure 4.13-c(1), "Prepare and Implement a Bicycle Detour Plan for All Bicycle Trails and On-Street Bicycle Routes, Provide Detours for Bicycle Facilities, and Coordinate with City and/or County Departments of Parks and Recreation to Repair Damage to Recreational Facilities," in the DEIS/DEIR would reduce temporary impacts to bicycle routes to a less than significant level because construction-related damage would be repaired or reconstructed; access would be restored; and detour routes, roadway markings to designate temporary bike lanes, and informational signs would be provided. Because consultation with the County and/or City of Sacramento Bicycle and Pedestrian Coordinator, as applicable, is included as part of this mitigation measure, noticing requirements and speed limits of detours will be based upon guidance from the relevant local agency.

USACE and SAFCA are not responsible for construction of bikeways or the establishment of connections from existing bikeways to surface streets. Although the Natomas Levee Recreational Trail Project is included as part of the Phase 4b Project description, further environmental review (i.e., CEQA) is likely to be required as design plans and specifications are developed.

Subject: DEIS/DEIR Comments due 8/16/10

Dear Ms. Holland,

Save The American River Association (SARA) was founded in 1961 to establish The American River Parkway and remains today as the guardian of and advocate for its lands and waters.

Since we are already on record in a letter dated June 3, 2010, as opposing the U.S. Army Corps of Engineers' nationwide policy to require state and local flood control agencies to remove trees, shrubs, and woody vegetation from flood protection levees and adjacent areas, SARA will confine its comments here to the DEIS/DEIR evaluating the potentially significant environmental impacts of the Phase 4b Project, Reach I: 1-4. O2-1

1. Please confirm our understanding that Reach I: 1-4 is included in the conditional variance granted SAFCA thereby avoiding the removal of significant waterside riparian vegetation that would have resulted in severe impacts to the environment and on users of the American River Parkway. In fact, only the landside vegetation of Reach I: 1-4 is slated for removal except as noted in 2. O2-2

2. It is our understanding that the removal of no more than 28 trees on the NEMDC at the Arden Garden/Northgate Boulevard location (between Jefferson and Harding Avenues to be exact), in an area of the Parkway designated Protected Area, will be mitigated at a ratio of 3 to 1. This mitigation will be installed at least one to two years before the loss of the 28 trees, and the mitigation will be fully monitored to insure its success as replacement SRA. The mitigation site is located on the NEMDC between Rimmer and Tanaya Avenues. Please note that this mitigation does not compensate the Public for the loss of habitat and natural amenities within The American River Parkway. The DEIS/DEIR should address some form of compensation for degradation occuring within a Federal, State and County protected Park and River. O2-3

3. The DEIS/DEIR lists Discovery Park as a potential staging area for the levee improvements. Since the exact location within Discovery Park is not specified in the environmental document, please note that we will request further environmental analysis if a site location is chosen that may have impacts on the plants, animals and birds who rely on the River and Parkway lands. O2-4

Thank you for the opportunity to comment regarding potential impacts of the Phase 4b Project, Reach I: 1-4, on The American River Parkway. For our records, please confirm that you received these comments by the DEIS/DEIR deadline of August 16th, 5:00 p.m. SARA looks forward to the courtesy of your response.

Sincerely,

Betsy Weiland, Co-Chairman
Land Use Committee
Save The American River Association
4950 Keane Drive
Carmichael, California 95608

O2-1 Comment noted.

O2-2 See response to comment F2-2. All but a 0.4-mile stretch of the NEMDC was approved under the vegetation variance approval granted on June 16, 2010. Reach I:1–4 of the American River north levee is included in the USACE-granted variance (see Appendix I of the Natomas PACR).

O2-3 The exact number and location of trees to be removed will be based upon final detailed plans and specifications, which will be developed if and when the Phase 4b Project is approved.

Mitigation Measure 4.7-a, "Minimize Effects on Woodland Habitat; Implement Woodland Habitat Improvements and Management Agreements; Compensate for Loss of Habitat; and Comply with Section 7 of the ESA, Section 2081 of the CESA, and Section 1602 of the California Fish and Game Code," of the DEIS/DEIR provides replacement ratios to reduce Impact 4.7-a, "Loss of Landside and Waterside Woodland and Shaded Riverine Aquatic Habitats," of the DEIS/DEIR. The habitat improvements from mitigation implementation would reduce long-term impacts to landside woodland habitats loss to a less-than-significant level. However, this impact would remain significant and unavoidable for many years before reaching a less-than-significant level because replacement plantings would require a minimum of 10–15 years before providing important habitat components such as shade and structure and decades to replace old growth trees, such as Heritage oaks.

Timing of replacement will be determined in coordination with DFG, NMFS, and the U.S. Fish and Wildlife Service (USFWS).

Impact 4.3-c, "Inconsistency with the American River Parkway Plan and Wild and Scenic Rivers Act," in the DEIS/DEIR addresses the impact to the American River Parkway from removal of vegetation.

O2-4 Comment noted. In the case that new environmental impacts or substantially greater environmental impacts are identified, due to project changes or new information, USACE and/or SAFCA would prepare further environmental analysis as required by State CEQA Guidelines, CCR Section 15162 and National Environmental Policy Act (NEPA) CEQ Regulation 1502.9.

O3

SACRAMENTO TREE FOUNDATION

August 16, 2010

Elizabeth Holland, Planning Division
U.S. Army Corps of Engineers, Sacramento District
1325 J Street
Sacramento, CA 95814

Re: Public Comment on the Draft Environmental Impact Statement/Draft Environmental Impact Report on the American River Watershed Common Features Project/Natomas Post-authorization Change Report/Natomas Levee Improvement Program, Phase 4b Landside Improvements Project

Dear Ms. Holland,

Thank you for the opportunity to comment on the Draft Environmental Impact Statement/Draft Environmental Impact Report (DEIS/DEIR) for the Natomas Levee Improvement Program, Phase 4b.

The Sacramento Tree Foundation appreciates the analysis made in the DEIS/DEIR addressing the preservation of as much waterside woodland as possible, thus reducing the impact to shaded riverine aquatic habitats. We understand the concept that the adjacent levee provides extra levee integrity with a redundant solution if the original levee should fail. This solution is a response to the Army Corps of Engineers' (Corps) perspective and policy that waterside and landside vegetation threatens the stability of levees.

While we appreciate the efforts made to preserve the waterside vegetation and trees, the basic premise of this approach – that trees on levees threaten the stability of levees – is flawed. It has not been proven that vegetation or trees weaken levee integrity. On the contrary, a 2001 report from the Engineer Research and Development Center (ERDC), which is the US Army Corps of Engineers' distributed research and development command, states:

O3-1

"…Riparian vegetation helps stabilize banks, which is valuable because otherwise expensive structures would have to be built to stabilize the bank." [1]

The same report further states:

"The stabilizing benefits of vegetation can be a strong inducement for their incorporation into flood control projects. Leaves and stems of plants intercept rainfall and reduce surface erosion both from runoff and from overbank flooding. Vegetation, primarily woody plants, also helps to prevent mass movement, particularly shallow sliding in slopes." [2]

"..healthy riparian vegetation also stabilizes streambanks, provides shade that prevents excessive water temperature fluctuations, performs a vital role in nutrient cycling and water quality, improves aesthetic and recreational benefits of a site, and is immensely productive as wildlife habitat. For these reasons, the incorporation of vegetation in stream restoration and flood control projects is often desirable.."[3]

"Flood attenuation is increased in vegetated riparian systems. As is the case for maintenance of stream morphology, the resistance of vegetation to flow is an important attribute for flood attenuation. The area that vegetation presents to flow is proportional to resistance (measured as Manning's n) and effectiveness at reducing flow velocity. This presented vegetational area of vegetation increases directly with increased stem size and density. Trees are most effective at resisting flow."[4]

Furthermore, on page 2-8 in the DEIS/DEIR, it is shown that in the past the Corps allowed vegetation to remain on levees and that during two subsequent floods, there was no evidence of instability or threat to safety:

"However, with the concurrence of USACE and the State, to minimize the project's environmental effects, trees were allowed to remain in the maintenance area along the landside toe of the improved levee and along the waterside slope of the levee and waterside berm. It was felt that these trees would not impair the performance of the improved levee because there was adequate visibility of and access to both sides of the levee to conduct routine maintenance and flood fighting activities. Nor was there any significant concern regarding the impact of the remaining trees on the safety or structural integrity of the improved levee. Although nearly overtopped and subjected to prolonged high flow during the flood of 1986, the old levee had performed well with few signs of stress. With its increased height, the new levee performed even better during the flood of 1997. However, this levee is no longer considered in compliance with USACE levee vegetation guidance, and avoidance of landside tree clearing in this maintenance area would require a variance from USACE.

O3-1
(Con't.)

The California Department of Water Resources, in their letter of April 15, 2010 regarding the Corps' vegetation variance policy:

"Whereas overtopping, underseepage, through-seepage, erosion and other high-risk modes of failure are well-documented in the Central Valley, we have not seen evidence that well-managed vegetations poses significant risks. We are not aware of any levee failures in the Central Valley that were caused by woody vegetation on levees, and interim studies suggest that woody vegetation has negligible detrimental effects on levee performance as well."

Bio-stabilization of levees is common practice in Europe and gaining ground in other parts of the world.[5] Given the scarcity of trees in California's Central Valley and the severe reduction in wildlife habitat already inflicted on the region, we believe a

policy of "clearing, grubbing, and stripping" levees is irresponsible and will cause irreparable, long-term harm to the environment as well as to our citizens given the air and water quality benefits of trees, -- to say nothing of the great economic cost to implement such a policy.

In the Corps' Engineering Technical Letter 1110-2-571, the benefits of landscape planting mentioned include dust and erosion prevention, water quality and wildlife habitat, and creating a pleasant environment for human use and recreation. But the benefits of trees with respect to our citizens go far beyond this list as shown below:

- Trees are a significant factor in reducing air pollution by means of nitrous oxide deposition, sulfur dioxide absorption, ozone interception, and particulate matter interception. 100 trees can remove 1,000 pounds of pollutants per year, including 400 pounds of ozone and 300 pounds of particulates.[6] Recent research shows the increasing public health threats of ultrafine particulate matter from car exhaust.
- On an annual basis, 100 trees can remove 5 tons of carbon dioxide from the atmosphere.[6] Large trees are the most effective for long-term carbon storage.
- In semi-arid California, trees catch and hold rainfall, which delays stormwater runoff and reduces flooding. A large deciduous tree can intercept between 500 and 760 gallons of water per year. A mature evergreen can intercept more than 4,000 gallons per year, depending on species and rainfall characteristics.[7] Preventing stormwater runoff improves water quality and water availability at the local level. Tree canopies reduce soil erosion by diminishing the impact of rain on barren surfaces.
- Plants clean the soil and water by removing contaminants such as metals, pesticides, crude oil, polycyclic aromatic hydrocarbons and more through the process known as phytoremediation. Tree species commonly used for phytoremediation include willow, poplar (cottonwood hybrids), and mulberry, because they have deep root systems and are able to control the movement of pollutants by consuming large amounts of water. Willow and poplar are the typical species for riparian woodland in Sacramento. While pollutant removal rates vary greatly, one study estimated that one sugar maple growing along a roadway removed 60 mg of cadmium, 140 mg of chromium, 820 mg of nickel, and 5,200 mg of lead from the environment during a single growing season.[8]
- In urban areas, such as the Natomas Levee in Sacramento, an increase in tree canopy can reduce the urban heat island effect by reducing ambient temperatures by 3 – 5 degrees Fahrenheit.[9]

O3-1
(Con't.)

We urge the Corps to re-consider well-established alternative methods of bio-stabilization on levees in order to preserve our limited environmental resources. If current research and empirical data are somehow insufficient, we again urge the Corps to expedite the research needed to determine the impact of trees and

vegetation on levee stability. Please take the time to fully consider these alternatives before implementing a policy of clearing, grubbing, and stripping in the West.

O3-1
(Con't.)

The Sacramento Tree Foundation believes that we can reach a better solution by working with a broad range of agencies and concerned citizens – a solution that will address our urgent environmental, levee stability, and human health concerns. Thank you very much for your consideration.

Sincerely,

Cindy Blain
Operations Director
Sacramento Tree Foundation

"During the 2011-15 period, the city will plant additional 810,000 trees along 112km of sea dykes, river and canal banks in the coastal district… City officials said the project was being undertaken because of the general ineffectiveness of various flood prevention programmes, on which the city had spent more than VND200 billion ($10.5 million) each year since 2008."

O3-1 On February 9, 2010, USACE posted a notice in the *Federal Register* (Vol. 75, No. 26) requesting comments on the Finding of No Significant Impact and draft Environmental Assessment on the *Process for Requesting a Variance From Vegetation Standards for Levees and Floodwall* . The comment period closed on April 25, 2010 (which was an extension from the original date of March 11, 2010). USACE is currently in the process of responding to comments and making a decision on the NEPA document.

Subject: RE: Phase 4b Draft EIR/EIS Comments

Liz and John,

Could we please include our GHCA comments to the Phase 4b "NOP" to the Draft Phase 4b comments? As far as we can tell nothing has changed, so our comments remain the same. The only thing we would like to add is that we are very encouraged the USACE has granted the "Vegetation Variance" for the NLIP and that the USACE will abide by the "Settlement Agreements" between SAFCA and GHCA.

As unpaid volunteers for our community it is very difficult to decipher the 1000's of pages of EIR/EIS's that have been generated year after year by very well paid consultants. Trying to do this with hundreds of individually downloaded files that are not 'hyperlinked' makes this even more onerous. The paper documents are the only reasonable way to compare any changes between Phase 1, Phase 2, Phase 2 (supplemental), Phase 3, Phase 4a, and Phase 4b (each document more than 1000 pages long, not including appendixes).

O4-1

Both the USACE and SAFCA websites only offer the "Draft Phase 4b" document in 17 multiple megabyte files that are not easily cross-referencable or 'hyper-linked'. In previous EIR/EIS's the entire document could be downloaded and seen as 'one entire document'. Trying to understand the scope and impact on our community is all but impossible with this segmented approach.

We only obtained a 'paper copy' of the Draft Phase 4b document on Friday the 13th, the weekend before the deadline. It took many calls, but thanks to SAFCA, they loaned us the only copy they had.

We respectfully request you incorporate the GHCA Phase 4b "NOP" comments to the "Draft Phase 4b EIR/EIS" comments.

Thank You,

Gibson Howell
President, Garden Highway Community Association

Subject: RE: Phase 4b Draft EIR/EIS Comments

Gib - I was trying to call you but got tied up in other phone calls and meetings this morning.

We are not providing extensions on this Phase as we must get the responses to comments completed and out to meet a deadline for congressional authorization. Please provide your comments to us today as we are now working through the responses. Sorry but we have to meet these deadlines to get authorization and funding this year.

I am not attending the meeting today - that is our levee safety section that deals with encroachments.

Subject: Phase 4b Draft EIR/EIS Comments

Liz,

Hello and hope all is well!

The GHCA was trying to generate our comments on Phase 4b using the website documents, but there are so many different files and they are so large it was proving to be near impossible. We just obtained a paper copy of the 4b Draft EIR/EIS last Friday and have been working on the GHCA comments this weekend. Can we please get an extension to file comments until either tomorrow (17th) or Wednesday (18th)? Any extension would be greatly appreciated.

Thank You,

Gibson Howell
GHCA

p.s. Will we be seeing you at the GHCA/SAFCA/USACE/CVFPB/RD1000 meeting today?

RE: Comments on Phase 4b Notice of Preparation

SAFCA and US Army Corps of Engineers:

The Garden Highway Community Association (GHCA) is an incorporated community association whose membership includes nearly all waterside and landside property owners along the Garden Highway in the area addressed in SAFCA s Natomas Levee Improvement Program (NLIP). The GHCA supports increased flood protection for the Natomas Basin, as long as it is done in a fiscally responsible, environmentally conscious, and scientifically sound manner. At the same time, as most GHCA members live on or next to the NLIP, they have an enormous interest and concern in how this project is implemented.

Below is a list of comments and concerns regarding the Phase 4b Notice of Preparation.

1. <u>Failure to Adequately Consider Alternative Designs</u>

SAFCA and the USACE have failed to conduct a legitimate, unbiased study to determine the most economically and environmentally sound project design to bring the Natomas Basin up to the USACE 100 year flood protection standard. SAFCA and the USACE have summarily dismissed feasible alternatives that would lead to region-wide solutions to the flooding potential in the Natomas Basin and surrounding communities. They have also failed to make a rationale, good faith effort at minimizing the height and footprint of the adjacent levee system, especially in light of the lower and inferior levee systems both upstream and adjacent to the NLIP. Therefore, the project is not in compliance of CEQA and NEPA requirements. O4-2

Pursuant to the applicable environmental laws, the agencies responsible for this Project must rigorously explore and objectively evaluate all reasonable alternatives and must devote substantial consideration to each alternative consideration.

Notably, during a recent SAFCA Board meeting which discussed the Project, it was repeated several times that the levee improvement design is a work in progress and that certification of ongoing EIS phases was a worst case scenario for the environment and property rights. Unfortunately, current environment destruction adjacent to Garden Highway does not correlate with these work in progress and worst case scenario portrayals. Rather, SAFCA and its contractors are in a race to remove highly sensitive habitat within the ENTIRE project footprint, despite the fact that alternative, less obtrusive levee improvement designs are gaining momentum and the fact that the Project is facing insurmountable fiscal problems.

O4-2 (Con't.)

The GHCA strongly encourages SAFCA and the USACE to look outside the Project s predestined box and not clear a construction path through sensitive habitats and rich farmland based upon worst case design scenarios. There are obviously countless alternative designs that would accomplish the flood protection our region needs at a fraction of the monetary, environmental and property-loss cost. For example, simply narrowing the footprint of the seepage berms would result in mammoth savings in all three of these areas. These berms, designed to be 500 feet wide in some areas, are unprecedented in our region and seem highly unwarranted when compared to the existing 10-20 foot berms that previously handled several 100-year-floods (without the cut-off walls that will be added as a part of this project). More telling, as evidenced by design concessions to certain property owners, SAFCA and the USACE have shown by their own actions that the footprint of the seepage berms can be substantially narrowed without losing the flood protection it seeks.

CEQA also requires a realistic analysis of the existing physical environmental conditions affecting the Project. Several court decisions have determined that the impacts of a proposed project must be measured against the "real conditions on the ground." Save Our Peninsula Committee v. Monterey County Board of Supervisors (2001) 87 Cal.App.4th 99, 121. "An EIR must focus on impacts to the existing environment, not hypothetical situations." ibid. In determining whether a project's impacts may significantly affect the existing environment, there must be a "baseline" set of environmental conditions to use as a comparison to the anticipated project impacts. As the Court of Appeal has explained, "it is only against this baseline than any significant environmental effects can be determined." County of Amador v. El Dorado County Water Agency (1999) 76 Cal.App.4th 99, 952.

O4-3

Despite these requirements, the plans for this Project fail to describe the existing physical environmental conditions in order to determine the Project's significant adverse impacts on the existing environment. Conversely, the entire NLIP design relies upon a computer simulation that describes a hypothetical physical condition, but does not describe the actual physical conditions on the ground, including the current condition of the west side levees along the Sacramento River and the north side levee along the Natomas Cross Canal. This comparison would answer the question of "levee parity" and whether any spots along the river side of the east levee improvements or west side of the Sacramento River in Yolo County, or north side of the Natomas Cross Canal in Sutter County, would be more vulnerable to flooding.

In other words, if the east side levee along the Sacramento River has sufficient freeboard to ensure safe containment of the "200-year" design water surface, then these improved levees will have a significant adverse effect on the existing lower levee, properties, and structures along the west side of the Sacramento River as well as the homes and residents along Garden Highway on the river side of the improved east side levees. O4-3 (Con't.)

The failure to evaluate the impact of a Project on the existing physical environmental conditions frustrates "the central function of the EIR, to inform decision makers about the impacts of the proposed project on the existing environment." Save Our Peninsula Committee, supra, 87 Cal.App.4th at p. 127.

The Project s plans further fail to consider the impacts of mounting environmental legislation and biological opinions which will significantly impact alternative flood protection plans, summarily dismissed by SAFCA as impossible or inconceivable. One such edict recently issued by the The National Marine Fisheries Service unveiled a complex set of rules, a biological opinion , which will likely have enormous impacts on local flood protection practices with the goal of increasing the populations of winter and spring-run salmon, Central Valley steelhead and green sturgeon. According to Kate Poole, attorney at the Natural Resources Defense Council, "There's no question any more about the fact that the Bay-Delta ecosystem is in dire need of significant changes and fixes. This is one big step to do that." O4-4

The new federal rules require that reclamation districts find a way to flood the Yolo Bypass more often to improve salmon habitat, negating SAFCA s argument that the Yolo Bypass could not be used to divert more water from the Sacramento River than current rules permit. Moreover, SAFCA s concern that water diversion to the Yolo Bypass would be too costly to local water and flood agencies apparently did not negate the decision on the new rules. The ruling governs water operations of the California Department of Water Resources, who will share the cost of the new orders. Clearly, flooding the Yolo Bypass more frequently will require a lowering of the Sacramento River weirs a proposal made by the GHCA during 2007 as a more effective, long-term solution in lieu of an eternal levee battle in the narrow channels of the Sacramento River.

2. Failure to Adequately Consider and Protect Wildlife

The United States Environmental Protection Agency has previously commented on the NLIP, noting its continued concern over the temporary and permanent effects the Project is expected to have on the waters of the United States and recommended the continued close consultation and collaboration with the U. S. Fish and Wildlife Agency, California Department of Fish and Game and The Natomas Basin Conservancy to ensure effects on woodlands, threatened and sensitive species habitat and waters of the US are avoided and minimized. Overall, this Agency has previously classified prior EIS drafts associated with the NLIP as Insufficient Information (EC-2) . O4-5

The California Department of Fish and Game DFG has also expressed serious concern regarding the environmental impacts of the NLIP: O4-6

- The DFG believes pertinent mitigation measures are potentially unenforceable and may not bring the impacts to fisheries and aquatic resources to below a level that is significant.

- The DFG has found transplantation of herbaceous plants is typically unsuccessful and should be considered experimental. Mitigation measures for any potentially unavoidable impacts to special-status plants should include additional measures to increase the chances of survival for the population in question. Mitigation sites should be permanently protected and managed in perpetuity.

- The DFG is concerned with potential impacts to raptor nesting behavior not currently addressed in the DEIR, especially with regard to 24/7 construction and an estimated 900-1000 haul trips per day to deliver fill material. The DFG believes that each of these activities could potentially result in significant impacts to nesting raptors including nest abandonment, starvation of young, and/or reduced health and vigor of eggs or nestlings that could result in death. O4-6 (Con't.)

- In their current form, the DFG opines that the environmental documents do not explore the potential impacts of nighttime construction activities on nesting raptors. Moreover, construction at night poses additional complications for the effectiveness of biological monitors in ensuring that appropriate buffer zones are in place around active nests and that birds do not abandon their nests.

- The DFG has noted that prior DEIRS do not provide a discussion of potential impacts to the Northern Harrier, a ground nesting raptor and does not consider avoidance or mitigation measures.

The GHCA further notes the NLIP purports to mitigate the loss of woodland habitat by the promise to create three acres of canopied woodlands for every one acre destroyed. This mitigation goal is fatally flawed in that there is no discussion, explanation and/or plan to address the environmental tragedy that will result from the 50 to 100 year period required for the new woodland habitat to be developed assuming the planned mitigation goal is even reached. O4-7

Despite the failure to mitigate the significant adverse impacts resulting from the destruction of woodland habitat, and the lack of necessary funding to effect the planned mitigation related thereto, SAFCA and its contractors are currently proceeding with the destruction of woodland habitat and the clear-cutting of heritage oaks and other trees.

Further, the NLIP also proposes to utilize lands purchased by the Natomas Basin Conservancy ("Conservancy") as borrow areas. These borrow areas will provide the base material for the landside levee improvements on the south side levee along the Natomas Cross Canal and the east side levee along the Sacramento River. Despite SAFCA's proposed use of these lands, the Conservancy acquired these properties to offset urban development's significant adverse impacts on protected wildlife species within the Natomas Basin. The Conservancy acquires and manages these properties consistent with the Natomas Basin Habitat Conservation Plan. The GHCA believes there still is no agreement between the Conservancy and SAFCA on the use of Conservancy lands and how these lands will carry out their intended conservation purpose after the soil necessary for the construction of the levee improvements is removed. Thus, any claimed mitigation for the loss and disturbance of Conservancy land is impermissibly deferred to some future time after Project approval and implementation. O4-8

Despite the fact that the Project s agencies have been afforded several bites at the apple in an attempt to come up with acceptable environmental mitigation, it continues to gloss over the devastating impact the O4-9

Project will have on the sensitive habitat of protected species, including raptors, snakes and flora (see comments of the California Department of Fish and Game summarized above). O4-9 (Con't.)

3. Failure to Study Simultaneous Multi-Phase Construction

SAFCA, and now the USACE, are currently postulating that multiple phases of the NLIP could be constructed simultaneously. This directly contravenes the construction impact and mitigation advanced in the prior environmental documents and creates new issues not previously studied or addressed. For example, there would be compounded effects of CO2 emissions, noise, dust, vibration, and disruption to wildlife that has not been analyzed. Compared to the original Phase 3 EIR, for example, emissions in just Sacramento County would raise from ROG 75 lb/day to 287 lb/day, NOX 413 lb/day to 1,476 lb/day, and PM10 971 lb/day to 3,847 lb/day if these phases are to be done simultaneously. Moreover, on page ES-16, Air Quality, the Phase 3 DEIR references the nonattainment status of the Feather River Air Quality Management District and the Sacramento Metropolitan Air Quality Management District for ozone and PM10. The GHCA contends the cumulative effect of simultaneous construction during multiple construction phases has not been sufficiently analyzed by the responsible agencies. O4-10

Furthermore, simultaneous construction could involve three or more phases of simultaneous, 24/7 construction. Given the grave impacts of just one 24/7 worksite, the GHCA believes SAFCA and the USACE certainly cannot justify multiple worksites operating in this manner. This impact would make the simultaneous Phases (2, 3, 4a, 4b) unreasonably harmful to wildlife, the environment, and Garden Highway residents. O4-11

4. Failure to Adequately Address Encroachments/Levee Prism

At page 7 of the NOP, Encroachment Management, the following proposed action appears: Remove encroachments as required to meet the criteria of the USACE, CVFPB, and FEMA. Conversely, the Sacramento Division of USACE and SAFCA have repeatedly advised members of the GHCA that the adjacent levee adopted by the NLIP should remove the waterside trees, landscaping, fencing, and other vegetation and improvements from the levee prism. In other words, these agencies believe implementation of the NLIP would spare these items from removal under even the most aggressive encroachment standards. Thus, the GHCA is concerned with the apparent unchanged position regarding encroachments as described in the current NOP. O4-12

Of utmost importance to property owners along Phase 4b, the USACE does not mention how they will treat vegetation and encroachments on either side of the levee where they decide not to build an adjacent setback levee and thus achieve a new levee prism. If a one size fits all approach of denuding levees is applied, it will completely contradict the long established local USACE procedures of planting trees to stabilize the levees, protect endangered wildlife and reduced wind-driven waves. We have also been told that many members of the scientific community believe trees and other vegetation improves the strength of a levee, especially in areas of the country that do not have to contend with hurricane strength winds. What are USACE s current views on this?

It also does not appear the USACE has identified what (if any) waterside encroachments will be subject to removal within the NLIP and what legal processes will be involved in condemnation of associated property rights. These questions are of utmost importance to the GHCA and its members. SAFCA has O4-13

also advised the GHCA it has maps of approximately 30,000 encroachments and all associated easements on the waterside of the levee. SAFCA recently revealed this database to the public, but there is no mention of the encroachments and/or vegetation that the involved flood agencies consider to be unacceptable. Research has revealed some vague, inadequately mapped easements dating back to the early 1900 s which appear to show little or no support for any planned encroachment removal.

SAFCA has also stated on the record it is willing to help facilitate post-facto permits for encroachments that do not endanger the levee. Would the USACE also be willing to endorse this procedure? Unfortunately, because the property owners have no information as to what items SAFCA and the USACE feel are acceptable encroachments, Garden Highway properties are being left in the dark. O4-13 (Con't.)

Overall, the members of the GHCA are very concerned about which encroachments might require removal and with the various easements SAFCA and/or its partners will attempt to claim. SAFCA has promised to work with each property owner to discuss and resolve issues regarding alleged encroachments, but thus far has taken no such action. Does the USACE plan on doing the same for Phase 4b? Currently, construction Phase 2 of the Project is underway, yet the GHCA is aware of no affected property owners having been contacted regarding encroachment or easement plans. This not only impacts existing improvements, but future improvements. The uncertainty also creates resale problems and negatively affects property values.

5. <u>Failure to Justify 24/7 Construction</u>

As accurately noted by the California Department of Fish and Game, previous EIRS/NEPA documents do not adequately address the potential impacts to raptor nesting especially with regard to 24/7 construction and an estimated 900-1000 haul trips per day to deliver fill material. The DFG believes that each of these activities could potentially result in significant impacts to nesting raptors including nest abandonment, starvation of young, and/or reduced health and vigor of eggs or nestlings that could result in death. Moreover, the NOP does not explore the potential impacts of nighttime construction activities on nesting raptors. Moreover, construction at night poses additional complications for the effectiveness of biological monitors in ensuring that appropriate buffer zones are in place around active nests and that birds do not abandon their nests. O4-14

The NOP contends Cutoff Walls, wells and perhaps additional aspects of the Project require a 24/7 construction schedule. The residents along Garden Highway and the sensitive environment that exists in the riparian, river habitat adjacent thereto cannot be subjected to 24/7 construction simply because SAFCA or the USACE is running behind schedule on what might be perceived as an overly ambitious project. It is anticipated 24/7 construction during subsequent phases of the NLIP would have an exponentially adverse impact on property owners spanning many miles in all directions. Moreover, the use of trucks to get to and from the actual construction sites will expand the location of the impact far beyond the limited construction sites addressed by SAFCA and this NOP. O4-15

The GHCA also feels the NOP ignores both city and county (Sacramento and Sutter) noise ordinances. As such, the GHCA seeks an explanation as how the USACE plans to deal with violations of local noise ordinances.

6. Damage to Businesses

The NOP fails to address the impact of the project on the businesses that exist along and upon Garden Highway which thrive only because individuals seek the tranquility and peace of a rural, river atmosphere that is easily accessible, peaceful and enjoyable. O4-16

7. Hydrology

The hydrology reports postulated by SAFCA and its engineers in previous Phases conclude the improved levee system contemplated by the NLIP will not increase the flood risk to the waterside property owners within the NLIP. These reports are explicitly based upon the assumption that other surrounding Reclamation Districts will NEVER improve their levees. This assumption is improper, flawed and not in concert with the current push by adjacent Districts to fortify their levees. The threat of increased flood risk cannot be summarily dismissed and a funding mechanism must be included to deal with the financial impact of this impact. O4-17

Equally troubling, SAFCA admits its design event analysis is not the same as the analysis procedure used by USACE. As the primary advertised goal of the NLIP is to obtain USACE certification, why is SAFCA deviating from the USACE event analysis? The previous SAFCA EIRS/NEPA documents further note that the USACE analysis includes consideration of system uncertainties. Does this mean the SAFCA analysis does not account for system uncertainties such as the other side of the levee overtopping or failing?

Waterside residents adjacent to the NLIP are very concerned about increased flooding of their homes due to the levee being raised as much as three feet. SAFCA has systematically advised the GHCA not to worry, as levees will overtop or fail elsewhere. Unfortunately, it appears SAFCA s engineering analysis does not account for this or assumes the other levees will be raised and reinforced. If both sides of the levee are eventually raised, then the water capacity of the river will be increased. This would allow the upstream reservoirs to release more water during a flood event and subject residents to a much greater chance of flooding. The GHCA has been advised there is debate amongst USACE engineers as to which provides the better hydrological model, perfect world where you cannot take into account deficiencies in other parts of the levee, or real world where you can. What is USACE s view on this? O4-18

8. Property Values

The NOP, consistent with all prior SAFCA action related to the NLIP, wholly fails to address the impact of the Project on property values in the affected areas and has no funding mechanism in place to deal with the destruction of property values in and around the project that will ripen into eminent domain and inverse condemnation lawsuits. This exposure includes, but is not limited to, irreparable damage to property values which began when this project was first publically announced (at a time when real estate values were significantly higher than today), and will continue indefinitely into the future. The Project has stalled and prevented sales, land improvements and retirement plans. This trend will increase exponentially when active construction begins. Due the lack of a funding mechanism, the taxpayers will be left to shoulder yet another wave of unanticipated and undisclosed cost overruns. O4-19

9. Failure to Consider Environmental Impact of Development

While SAFCA publicly justifies the massive NLIP as a necessary cure for the imminent, Hurricane Katrina type flooding that could occur in the Natomas Basin in the event of a 100-year-flood, in reality SAFCA is simply trying to lift the building moratorium affecting the builders who have imprudently chosen to pave over rice fields in a basin . These are the same developers who have spent hundreds of thousands of dollars supporting our local officials and lobbying for the right to resume rapid development within the floodplain. Without more urban sprawl , these developers and the County of Sacramento are unable to tap into the quick cash that has been created from destroying our evaporating farm lands.

The GHCA contends that rather than encouraging additional urban sprawl, local agencies should be focusing on creating more housing in urban areas, i.e. building up, not out. Moreover, the failure of local agencies to curb their appetite for our farmlands will only increase traffic congestion, gas and carbon emissions and regional pollution at a time when universal fears and concerns over global warming, water scarcity and energy depletion is gaining momentum. O4-20

The GHCA contends the urban sprawl into the Natomas Basin, quite ironically, increases the flood potential for Natomas and surrounding communities. Vast farmland that previously collected and stored water during heavy storms, before slowly releasing it through natural underground seepage, has now been paved and improved with storm drains. Accordingly, thousands of acre feet of rainwater that previously rested safely within area farmland is now immediately collected and pumped into the Sacramento River. Historical flow charts from the Sacramento River during times of heavy storms confirm the negative impact Natomas Basin development is having on regional flood protection.

10. Failure of the Notice of Preparation to abide by the Settlement Agreement between SAFCA and the GHCA.

The Notice of Preparation in no way mentions the previously agreed to settlement agreement between SAFCA and the GHCA. While the GHCA understands the USACE is not SAFCA, as the assignee of certain aspects of the Project, the USACE is legally required to comply with all legally enforceable agreements entered into by SAFCA, the assignor. To hold otherwise would render the settlement agreement between SAFCA and the GHCA illusory. O4-21

11. Rights of Entry/Eminent Domain.

It has recently come to the attention of the GHCA that SAFCA has pursued Right of Entry Agreements from Garden Highway property owners without advising those property owners of any authority for the desired access and without advising owners of their associated rights. By withholding this critical information, SAFCA has in essence coerced many Garden Highway residents into making uninformed decisions under the bold threat of imminent litigation should they resist. O4-22

In response to a recent complaint by the GHCA, counsel for SAFCA has confessed that entry onto the private property of Garden Highway residents is being sought pursuant to the Eminent Domain laws of the State of California. However, pursuant to California Code of Civil Procedure Section 1245.010, SAFCA and/or its contractors must be **authorized to acquire property for a particular use before**

they may enter private property in order to take photographs, studies, surveys, examinations, tests, soundings, borings, samplings, or appraisals or to engage in similar activities reasonably related to acquisition or use of the property for that use. Apparently, SAFCA has repeatedly misinformed property owners that SAFCA possesses this authority when, in reality, no such authority had ever been obtained.

Based upon the foregoing, the GHCA hereby submits that all involved flood agencies seeking permission to enter private property must notify the affected property owners **of the legal authority upon which the agency relies, along with a full description of the associated rights afforded the property owners**. O4-22 (Con't.)

Lastly, the GHCA hereby objects to the taking of private lands pursuant to the Eminent Domain laws under the guise that these lands are necessary for the development of the Project, when in fact the involved agency actually and surreptitiously plans to convey the condemned land to another private party, i.e. the airport.

12. Natomas Levee Recreational Trail Project.

The GHCA is pleased a recreational trail is finally being included as part of the NLIP. Unfortunately there is no funding mechanism in place other than waiting on the Department of Transportation, which has admitted could take years. As SAFCA and the USACE are already spending millions of dollars protecting cultural resources of Native American Indians, the GHCA believes it would be practical to allocate a nominal sum of money to enhance the resources of the current living residents in the Natomas Basin. The simple modification of the design of the new levee crown from a gravel road to paved road would bear a meager cost and would streamline the bike path for the DOT. O4-23

13. Incorporation.

The GHCA also hereby incorporates by reference all comments asserted by Garden Highway property owners and/or their representatives in response to this portion of the NLIP.

In sum, while the GHCA appreciates the daunting task this Project presents to the involved flood agencies, its members strongly feel that a more rational design approach would substantially reduce these challenges, save the taxpayers hundreds of millions of dollars, preserve sensitive habitat and rich farmland and ultimately expedite recertification of the Natomas levees. Moreover, the GHCA implores the involved flood agencies to continue to acknowledge and adhere to the rights of all Garden Highway residents, businesses and property owners. O4-24

Respectfully submitted,

GARDEN HIGHWAY COMMUNITY ASSOCIATION

O4-1 USACE and SAFCA will treat Garden Highway Community Association's (GHCA's) comment letter on the Phase 4b notice of preparation (NOP) as a comment letter on the DEIS/DEIR. See responses to comments O4-2 through O4-24.

USACE and SAFCA have prepared the NLIP environmental documents, including the DEIS/DEIR, in accordance with NEPA and CEQA, in particular the tiering provisions (see Section 1.5, "Environmental Regulatory Framework and Relationship of this EIS/EIR to Other Documents," of the DEIS/DEIR). USACE and SAFCA have strived to ensure that the NLIP environmental documents are understandable to decision makers and to the public, while still containing the level of detail necessary for a robust and technically adequate analysis aimed to withstand legal scrutiny. To help facilitate clarity, the NLIP environmental documents, including the DEIS/DEIR, include numerous plates, tables, and formatting considerations to highlight discussions pertaining to project alternatives, environmental impacts, and proposed mitigation measures.

The files on USACE's and SAFCA's Web sites are purposefully numerous to keep the files to manageable and easily downloadable sizes (less than 5 MB). It is not clear how the commenter proposes to hyperlink or cross-reference the files; however, the Table of Contents should serve as a guide the document as well as Chapter 10, "Index," of the DEIS/DEIR.

Regarding the late timing of the commenter receiving a paper copy of the DEIS/DEIR, a notice announcing the availability of the document was mailed to affected residents (including the commenter) on June 29–30, 2010 and printed in the *Sacramento Bee* on July 2, 2010. The notice indicated the electronic availability of the DEIS/DEIR on USACE's and SAFCA's Web sites, as well as where paper copies could be reviewed (at USACE's and SAFCA's office and at two local libraries). Additionally, CD or paper copies could have been requested from either USACE or SAFCA; several of these requests were received and materials were typically mailed within 48 hours of the request. The high cost of printing and the project's extensive mailing list have rendered paper copies of the NLIP documents mostly infeasible.

O4-2 Under NEPA and CEQA, the Federal and state lead agencies must consider a reasonable range of alternatives that would achieve most of the project objectives (project purpose, under NEPA) and reduce some of the environmental impacts of the project. The alternatives must also include a no-project (no action, under NEPA) alternative. Lead agencies are not required to consider every conceivable alternative, but are instead required to present a range of reasonable alternatives to foster informed decision-making (see CCR, Title 14, Section 15126.6 and 40 Code of Federal Regulations [CFR] 1502.14).

Section 2.1.5, "Alternatives Considered, but Eliminated from Further Consideration," of the DEIS/DEIS describes 11 alternatives that were considered but eliminated from further consideration in previously certified and approved NLIP environmental documents (and one additional alternative that was considered and eliminated by USACE as part of the Natomas PACR). This discussion illustrates the range of possible alternatives considered by USACE and SAFCA in relation to the NLIP as a whole. The DEIS/DEIR carries forward three alternatives to the Phase 4b Project for detailed analysis: the No-Action Alternative, the Adjacent Levee Alternative (Proposed Action), and the Fix-in-Place Alternative. The differences among these

alternatives are described in Table ES-1of the DEIS/DEIR, and the differences in associated environmental effects of the alternatives are described in Tables 2-28 and 2-29 of the DEIS/DEIR. Because the Phase 4b Project alternatives vary in the nature and severity of their potential environmental effects, USACE and SAFCA have presented a reasonable range of alternatives from which to select the Proposed Action.

The DEIS/DEIR attempts to describe the full range of potential adverse environmental effects, including and up to a worst-case scenario. As such, a range of 100–300 feet is provided for the likely width of the proposed seepage berms along the Sacramento River east levee Reach A:16–20 (see Table 2-2 of the DEIS/DEIR). As project design progresses, it is anticipated that the seepage berms may be more narrow in some locations depending, in part, on design considerations and property issues; however, the DEIS/DEIR takes a conservative approach in analyzing potential impacts and thus presents a worst-case scenario.

O4-3 Chapter 3, "Affected Environment," of the DEIS/DEIR provides detailed information related to the existing physical environment of the Phase 4b Project area. As discussed in Section 4.1.2.2, "Impact Mechanisms," of the DEIS/DEIR, the CEQA environmental analysis compares the action alternative and no-project alternative (No-Action Alternative) to the existing conditions at the time of release of the NOP (i.e., baseline for the purposes of CEQA), which was November 5, 2009 for the Phase 4b Project. NEPA considers the No-Action Alterative (i.e., expected future conditions without the project) to be the baseline to which the action alternatives are compared, and the No-Action Alterative is compared to existing conditions (including the Phase 2 Project). Each issue area discussed in Chapter 4, "Environmental Consequences and Mitigation Measures," of the DEIS/DEIR includes the section, "Methodology and Thresholds of Significance," where the impact mechanisms specific to the respective issue areas are discussed.

Section 4.5.1.1, "Methodology," of the DEIS/DEIR provides an overview of surface hydrology analysis, and states, specific to the NLIP analysis:

> The surface hydrology analysis evaluates the potential flood-related impacts of the action alternatives on water surface elevations in the stream and river channels in the project area and in the larger watershed within which the project is situated. Specifically, a UNET hydraulic computer model was used to compare existing conditions in the waterways surrounding the Natomas Basin and in the larger SRFCP both with and without the Adjacent Levee Alternative (Proposed Action) (with-project and without-project [i.e., No-Action Alternative], respectively) assuming no levee failure and other reasonably foreseeable improvements to Folsom Dam and the urban levees outside the Natomas Basin.

Following this discussion, Table 4.5-1 of the DEIS/DEIR summarizes the conditions and assumptions associated with each of the model runs. The modeling output generated by these conditions under the targeted flood scenarios is displayed in Tables 4.5-2 through 4.5-8 of the DEIS/DEIR. More detailed hydraulic modeling results are included in Appendix C of the DEIS/DEIR.

The use of a hydraulic computer model of the Sacramento River Flood Control Project (SRFCP) was reviewed and approved for use for this project in 2006 by the USACE Sacramento District to compare existing conditions in the waterways surrounding the Natomas Basin and in the larger SRFCP with and without the NLIP improvements and the other improvements comprising the 200-year flood protection program for the Sacramento area. See Appendix C of the DEIS/DEIR for more information regarding the hydrologic modeling approach.

O4-4 As discussed in Section 2.1.5, "Alternatives Considered, but Eliminated from Further Consideration," of the DEIS/DEIR, the Yolo Bypass Improvements alternative was eliminated from consideration because:

> (1) it would be too costly for SAFCA to implement; (2) levee height increases and substantial seepage and slope stability remediation would still be required for the Natomas perimeter levee system, adding to costs; (3) these improvements lie outside of SAFCA's jurisdiction and would require Federal, State, and local cooperation and funding; and (4) the project objectives of restoring 100-year (0.01 AEP) flood protection to the Natomas Basin could not be achieved as quickly as possible.

Implementation of the Phase 4b Project is contingent on issuance of numerous permits, authorizations, and approvals, including biological opinions from USFWS and NMFS; these agencies will consider applicable environmental legislation and biological opinions before issuance of permits. The project cannot proceed without the required permits.

O4-5 EPA's comment letter on the Phase 3 DEIS/DEIR and USACE's and SAFCA's responses in the Phase 3 FEIR are included as **Appendix J3** to this FEIS/FEIR. Comments on previous NLIP environmental documents, as well as any resulting project/document revisions made in response to those comments, were incorporated into subsequent NLIP environmental documents, including the Phase 4b DEIS/DEIR, as applicable. USACE and SAFCA have and will continue to work closely with EPA, USFWS, NMFS, DFG, and The Natomas Basin Conservancy (TNBC).

O4-6 DFG's comment letter on the Phase 3 DEIS/DEIR and USACE's and SAFCA's responses in the Phase 3 FEIR are included as **Appendix J4** to this FEIS/FEIR. Comments on previous NLIP environmental documents, as well as any resulting project/document revisions made in response to those comments, were incorporated into subsequent NLIP environmental documents, including the Phase 4b DEIS/DEIR, as applicable. See also response to comment O4-14.

O4-7 Impact 4.7-a, "Loss of Landside and Waterside Woodland and Shaded Riverine Aquatic Habitats" of the DEIS/DEIR addresses short-term (10–15 years) and long-term impacts due to loss of woodland habitat. SAFCA disagrees with the commenter's statement that it would take 50–100 years for new woodland habitat development. Based upon the expert professional judgment of SAFCA's biological consultants, habitat function would be expected to be restored within approximately 10–15 years, as described in Impact 4.7-a, "Loss of Landside and Waterside Woodland and Shaded Riverine Aquatic Habitats." Regardless of the length of time required to restore woodland habitat that would provide existing ecological function, the DEIS/DEIR concludes that short-term (10–15 years) impacts to woodland habitats would be a significant and unavoidable impact for 10–15 years before reaching a less-than-significant level because replacement plantings would require a minimum of 10–15 years before providing important habitat components such as shade and structure. SAFCA's previous projects involving woodland plantings and transplants within the project vicinity have been successful. Of 50 trees planted in the Rio Linda Creek Conservation Area, 94% have survived; similarly, of 14 oaks transplanted by SAFCA in 2004 as part of the Hagedorn Grove project, 12 survived (Buck, pers. comm., 2009).

At the time of submission of this comment letter on the Phase 4b Project (August 17, 2010), woodland plantings and transplants have not yet been completed; therefore, it is not yet possible to report on the success rate for these tree plantings and transplants for the Phase 3 and 4a Projects. However, pursuant to the woodland planting and maintenance contract, SAFCA's contractor for tree planting is required to attain performance standards (as approved by USACE, USFWS, and DFG through the Phase 2 Mitigation Monitoring Plan [MMP] approval process) during the initial maintenance period, which is the 3-year-period immediately following

acceptance of the installation portion of the woodland plantings by SAFCA. If the performance standards are not met, the project will not be accepted until the identified remedial actions are implemented by the contractor as directed by SAFCA. These remedial measures could include additional/replacement weed control or additional planting, using adaptive management to identify those plants best suited to the site. Performance standards included in the construction contract are listed below.

Performance Standards for Planting Survival During the Maintenance Period		
Year	Survival of Container Plants by Area (%)	Survival of Native Seed by Area (%)
1	95	50
2	95	50
3	90	50
Assessment Timing	Late Summer	Late Summer
Source: SAFCA 2009		

SAFCA will conduct field assessments of the plant survivorship once per year, at the timing noted in the above table. Healthy plants are considered to be robust, in good form, free of disease and insect infestation, and exhibit vigorous growth (foliage and wood); they must not be heat- or water-stressed (SAFCA 2009).

In addition to the 3-year initial maintenance period, the MMP requires that SAFCA monitor and maintain woodland plantings for an additional 5 years (for a total of 8 years). Monitoring and maintenance plans discussed above are based upon the Phase 2 MMP, which was approved by USACE, USFWS, and DFG. SAFCA anticipates that these agencies would approve the same monitoring and maintenance schedules, which would be applied to the Phase 4b Project woodland planting component in the Phase 4b MMP.

The commenter does not provide specifics with regard to a lack of mitigation for removal of vegetation as part of implementation of earlier phases. Woodland plantings have occurred on parcels in Reach C:1, 2, and 4a to compensate for vegetation removal that has occurred as part of the Phase 2 and Phase 3 Projects. USACE will comply with its policy that mitigation must be constructed prior to or concurrent with project construction. The Phase 4b Project will comply with California Fish and Game Code Section 2081 requirements.

O4-8 The commenter's assertion that the NLIP will use TNBC lands for borrow material is incorrect. Table 2-22 in the DEIS/DEIR lists the proposed borrow sources for the Phase 4b Project. Additionally, Table 4.1-1 in the DEIS/DEIR lists the proposed borrow sites for the Phase 2, 3, and 4a Projects. These tables indicate that one of the primary sources of soil borrow would the Fisherman's Lake Borrow Area. TNBC owns some lands adjacent to the Fisherman's Lake Borrow Area, including managed marsh and agricultural upland (field crop). These TNBC-owned conservation lands would not be used for borrow operations. Lands that are currently used for agricultural purposes would provide borrow material, and would then be reclaimed as a mosaic of managed marsh and uplands. These sites would thus create connectivity between existing TNCB parcels adjacent to the Phase 4b Project borrow sites (see Plates 2-22d through 2-22f in the DEIS/DEIR, which shows the location of TNBC lands in relation to the proposed Phase 4b Project borrow sites). The Long-Term Management Plan (LTMP), which has been approved by the resources agencies and USACE, states that SAFCA intends to enter into management agreements with TNBC to manage the borrow/mitigation sites at Fisherman's Lake. These

agreements will not be executed until SAFCA has more specific plans and specifications for these sites.

O4-9 The DEIS/DEIR provides a list of significant and unavoidable impacts that would result from implementation of the Phase 4b Project (see Sections ES.11.2, "Significant and Unavoidable Impacts of the Action Alternatives," and 5.4, "Significant and Unavoidable Environmental Impacts," of the DEIS/DEIR) because no feasible mitigation is available to reduce the significant impacts to a less-than-significant level, or identified mitigation would minimize the impacts but would not reduce the significant impacts to a less-than-significant level. Impacts to biological resources are included on this list and are discussed in detail in Chapter 4, "Environmental Consequences and Mitigation Measures," of the DEIS/DEIR. USACE and SAFCA are obligated to secure permits from the applicable resource/regulatory agencies before project construction that could affect agency-regulated habitat. Issuance of these permits indicates that proposed mitigation and compensation are considered to be acceptable according to applicable Federal, state, and local regulations. Project construction cannot commence in areas where such permits are required. Agency documents are legally binding, enforceable terms and conditions of the various agencies including: USACE, USFWS, NMFS, DFG, TNBC, Sacramento County, the Sacramento County Airport System, the Natomas Central Mutual Water Company, and RD 1000. See also response to comment O4-6.

O4-10 As discussed on pages 4.11-2 and 4.11-3 (especially Table 4.11-1) of the DEIS/DEIR, to ensure that worst-case air quality impacts were captured for both the Adjacent Levee Alternative (Proposed Action) and the Fix-in-Place Alternative as required under NEPA and CEQA, emissions were estimated assuming that a portion of the Phase 4a Project (specifically, improvements to the Sacramento River east levee Reach A:13–15 and the Riverside Canal) is constructed in 2012, concurrent with the beginning of Phase 4b Project construction. It should be noted that emissions are estimated within the air districts that regulate them using mass emission thresholds for regional impact analysis. The Phase 4a Project components that would overlap with the Phase 4b Project (in the 2012 construction season) are located within Sacramento County. See also response to comment F3-2.

O4-11 As stated in the DEIS/DEIR, residents in or near the affected cutoff wall work area would be afforded the opportunity, at the project proponent(s)'s expense, to temporarily relocate to a nearby hotel for as long as construction extends 24 hours per day, 7 days per week (24/7) within 500 feet of their residence (see Mitigation Measure 4.12-a, "Implement Noise-Reducing Construction Practices, Prepare and Implement a Noise Control Plan, and Monitor and Record Construction Noise Near Sensitive Receptors," of the DEIS/DEIR). Further, because 24/7 noise impacts are localized in nature, it is not clear how these impacts would be "compounded" by occurring in different locations at the same time or in different weeks, months, or years. Because 24/7 work would be conducted in discrete locations within the areas already identified for construction, and would only affect people locally for relatively short periods of time, there would not be any undisclosed compounding of effects that was not already analyzed in the DEIS/DEIR analysis of construction impacts. See also **Appendix J2** of this FEIS/FEIR, which includes the Phase 3 FEIR Master Response concerning 24/7 construction.

O4-12 See response to comment F3-1 regarding approval of the vegetation variance.

O4-13 See Section 2.3.4.11, "Structural Encroachments," of the DEIS/DEIR.

O4-14 See response to comment O4-6. Impact 4.7-f, "Impacts on Swainson's Hawk and Other Special Status Birds" in the DEIS/DEIR describes potential disturbance of special-status birds during project construction, which would occur during the daytime and nighttime. Mitigation Measure

Mitigation Measure 4.7-f, "Minimize Potential Impacts on Swainson's Hawk and Other Special-Status Birds Foraging and Nesting Habitat, Monitor Active Nests during Construction, Implement All Upland and Agricultural Habitat Improvements and Management Agreements to Compensate for Loss of Quantity and Quality of Foraging Habitat, Obtain Incidental Take Authorization; and Implement Mitigation Measure 4.7-a, 'Minimize Effects on Woodland Habitat, Implement all Woodland Habitat Improvements and Management Agreements, Compensate for Loss of Habitat, and Comply with Section 7 of the Federal Endangered Species Act, Section 2081 of the California Endangered Species Act, and Section 1602 of the California Fish and Game Code'" in the DEIS/DEIR would be implemented during both daytime and nighttime activities to help reduce this impact; however, the impact would remain significant and unavoidable for 10–15 years due to the short-term (10–15 years) loss of woodland habitat.

O4-15 The DEIS/DEIR describes those project components that could require 24/7 construction, and states that 24/7 construction would only occur in rural areas, not in urban areas. The noise standards and ordinances of the City of Sacramento and Sacramento and Sutter Counties are described in Section 3.12, "Noise," of the DEIS/DEIR.

As discussed in Section 2.3.3.2, "Adjacent Levee Alternative (Proposed Action)," under subheading "Sacramento River East Levee (Reach A:16–20)," of the DEIS/DEIR, cutoff wall construction in the urbanized area east of the Interstate 80 (I-80) overcrossing (within the limits of the City of Sacramento), where most residences are located, would be restricted to daytime hours. Therefore, the City of Sacramento noise ordinance would not be violated in terms of construction equipment operating near homes during the more noise-sensitive early morning and nighttime hours (i.e., during hours that are not exempted by the applicable local ordinances in the City of Sacramento).

Work in Sacramento County could occur during nighttime hours. However, Section 6.68.090 of the Sacramento County Code exempts nighttime noise activities when unavoidable conditions occur during a construction project and the nature of the project necessitates that work in process be continued until a specific phase is completed. This exemption allows work to continue after 8:00 p.m., including operation of machinery and equipment as necessary to bring the specific work in progress to completion under conditions that will not jeopardize inspection acceptance or create undue financial hardships for the contractor or owner.

As discussed in Impact 4.12-a, "Generation of Temporary and Short-Term Construction Noise," of the DEIS/DEIR, construction at sites within Sutter County, including the Pleasant Grove Creek Canal (PGCC), State Route 99 Natomas Cross Canal (NCC) (bridge remediation), Vestal Drain ditch (relocation), Brookfield borrow site (conversion to managed marsh), and Chappell Drain and Ditch, would not affect sensitive receptors, regardless of whether it occurs during nighttime hours, because no noise-sensitive land uses are within 1,000 feet of construction activities and/or because topographic features (such as a levee) would shield sensitive receptors from noise sources. Therefore, the Sutter County noise ordinance would not be violated.

See also response to comments O4-11, O4-14, and **Appendix J2** of this FEIS/FEIR, which includes the Phase 3 FEIR Master Response concerning 24/7 construction.

O4-16 Mitigation Measure 4.3-d, "Notify Residents and Businesses of Project Construction and Road Closure Schedules; and Implement Mitigation Measures 4.10-a, 'Prepare and Implement a Traffic Safety and Control Plan for Construction-Related Truck Trips,' and 4.10-c, 'Notify Emergency Service Providers about Project Construction and Maintain Emergency Access or Coordinate Detours with Providers'" in the DEIS/DEIR requires the project proponent(s) to provide business

owners with information pertaining to construction activities, complaint procedures, and construction timelines.

It should further be noted that effects analyzed under CEQA must be related to a physical change in the environment (State CEQA Guidelines CCR Section 15358[b]). Economic and social effects are not considered environmental effects under CEQA. These effects need to be considered in an EIR only if they would lead to a significant adverse effect on the physical environment.

NEPA does require consideration of economic effects (40 CFR 1508.8); however, this requirement is limited to effects that are reasonably foreseeable rather than speculative in nature (Mandelker 2007: 8-102, citing *City of Riverview v. Surface Transp. Bd.,* 398 F 3d 434 [6th Cir. 2005]). Here the commenter states that the project would have an effect on business along Garden Highway, but does not offer specific facts linking the project to a demonstrable effect on these businesses that can be clearly attributed to the project. Absent specific facts showing a clear effect on these businesses, this comment contains speculation that is beyond the required and practicable scope of analysis under NEPA.

O4-17 SAFCA's conclusion that the NLIP would not increase the flood risk to waterside property owners along Garden Highway is based on surveys that indicate that the Sacramento River east levee is currently higher than most of the Sacramento River west levee in the reach downstream of the NCC. Therefore, increasing this height differential would not alter the current balance of risks in this reach of the system. The increased height of the east levee would contribute cumulatively to an increase in flood risk to waterside property owners only if the west levee were raised to a height equal to or greater than the current height of the east levee. The protected basin on the west side of the Sacramento River is agricultural in nature; it contains very few damageable structures. As discussed in Section 3.2.2, "Environmental Setting," of the DEIS/DEIR, SAFCA recently entered into an arrangement with Yolo County, the California Department of Water Resources (DWR), the Yolo Land Trust, and the Sacramento Valley Conservancy that resulted in the recordation of agricultural conservation easements on 1,660 acres of land in this basin. Under these circumstances and in light of recently enacted revisions to the State's Planning and Subdivision laws restricting development in floodplain areas, it is highly unlikely that the Sacramento River west levee will ever be raised to a height exceeding the current height of the Sacramento River east levee.

Further, the commenter states that "these reports are explicitly based upon the assumption that other surrounding Reclamation Districts will never improve their levee." This statement is not correct. USACE and the CVFPB have set policies that grant all levee districts the opportunity to strengthen their levees. If a levee district chooses to raise a levee, then that district must demonstrate that it will not have an adverse impact. The Phase 4b Project's hydraulic impact analysis took this into consideration by assuming that other levees in the system would overtop, but not fail. If other levee districts choose to raise their levees then those districts will need to conduct a hydraulic impact analysis to demonstrate that there are not adverse impacts.

O4-18 Contrary to what the commenter states, SAFCA is not seeking certification of the levee system by USACE. SAFCA's methodology for developing a design water surface does differ from USACE's methodology; however, the method for determining hydraulic impacts is the same. The hydraulic impact analysis contained in the DEIS/DEIR evaluates hydraulics impacts based on upstream levees failing when overtopped along with the condition of allowing upstream levees to overtop without failing. Both of these conditions resulted in a conclusion that the impact was less than significant (see Section 4.5, "Hydrology and Hydraulics," in the DEIS/DEIR). Also, see response to comment O4-17.

O4-19 See response to comment O4-16 regarding NEPA and CEQA requirements to analyze economic effects.

O4-20 See response to comment F3-5.

O4-21 USACE is not legally required to comply with the Garden Highway Settlement Agreement, contrary to what the commenter states. However, USACE has agreed to implement many of its provisions, as indicated in the mitigation measures contained throughout the DEIS/DEIR.

It should be noted (and it was noted in response to GHCA's comment O1-23 on the Phase 4a FEIR and FEIS) that SAFCA is also not legally required to comply with the Garden Highway Settlement Agreement, which concerns only the Phase 2 Project, but which is being voluntarily implemented by SAFCA for the other NLIP project phases.

O4-22 This is not a comment on the DEIS/DEIR. SAFCA has been given legal authority by the Legislature "to coordinate a regional effort to finance, provide, and maintain facilities and works necessary to ensure a reasonable and prudent level of flood protection, as determined by the agency…" (California Water Code App., Section 130-20[c]), which includes entering into right of entry agreements. To the extent that property must be acquired to implement the Phase 4b Project, USACE and SAFCA would comply with all applicable legal requirements.

O4-23 As stated in Section 2.3.4.7, "Natomas Levee Class 1 Bike Trail Project," of the DEIS/DEIR, additional design and engineering work is required to determine the exact alignment of the bike trail in terms of its placement in relation to levees and roadways. Therefore, this element of the Phase 4b Project is analyzed at a program level of analysis in the DEIS/DEIR. Construction, operation, and maintenance of a recreation trail on the perimeter levee system would be funded locally, separate from the levee improvement elements of the Phase 4b Project. Site-specific environmental review will be conducted once detailed design is available.

O4-24 Comment noted. See responses to previous comments regarding environmental issues.

Elizabeth;

Thanks, that gives me a better understanding of the purpose of the EIS/EIR which in part is to present the worst case scenarios.

Laurie has provided some detail depicting what is more likely to be actually constructed. From that information it appears the impact to our property is much more conservative and at this point does not seem to impact the tower or building.

Greg,

I understand you spoke with Laurie Parker from our real estate division. What you have reviewed is a draft EIS/EIR for the Natomas Study, we do not have authorization from Congress at this time for a project and so therefore, you have not been contacted about the location of the KVIE tower. If we receive congressional authorization for a project we will work to prepare design refinements. That is when we would coordinate with you on the tower. We will take your e-mail as a comment on the draft EIS/EIR and make sure that

it is considered in the final document. We will also work with you to look at alternatives in this area when we start to prepare plans and specifications. We will try and design to provide public safety and prevent impacts to the KVIE tower. At this time we are just not to a point that we can provide you with details of what will occur in that area - our EIS/EIR looks at the greatest potential impacts as required under NEPA.

If you have further questions please give me a call and if I cannot help you and will find someone who can.

Subject: NLIP Garden Highway Reach 16

John and Elizabeth;

KVIE owns property affected by the proposed levee improvements described in the just released DEIS/DEIR for the Natomas Levee Improvement Program. Our property is located on Garden Highway in the area described as Reach 16 in the document.

Located on our property, which is adjacent to the present levee, is a communications tower and associated building and equipment that is used to relay our broadcast programming from our studio to our transmitter site located in Walnut Grove, as well as an interconnection with our sister PBS station KQED in San Francisco.

B1-1

In reading through the DEIS/DEIR it is clear that as part of this project major changes would take place on our property. Plate 2-8A (attached) shows that along with the widening of the levee itself, the finished grade of the 300 foot seepage berm would be substantially higher than the existing grade and extend through the present location of our tower and building. This is quite alarming especially as we were not informed earlier of the possibility that we would have to move or modify this vital tower, building and equipment.

I need one of you to call me to further explain exactly what's planned and its impact on our facility and property on Garden Highway.

Greg Johnson

KVIE
Greg Johnson, Director of Engineering
July 14, 2010

B1-1 The DEIS/DIER analyzes the worst-case scenario (i.e., the greatest potential impacts that could occur), which may include conflicts with existing KVIE facilities. If Congress authorizes the Phase 4b Project, USACE and SAFCA will begin detailed plans and specifications of project features. If possible, KVIE structures, including the communications tower, would be avoided. In the case that avoidance is not possible, USACE and SAFCA will coordinate with KVIE to ensure that impacts are minimized to the greatest degree possible.

Re: Comments on DEIS / DEIR and Natomas PACR

Dear Mr. Bassett:

This is to comment on deficiencies we perceive in the above materials. Although we support simultaneous efforts to improve flood protection and conservation in our neighborhood, we also believe it is critical to delineate all impacts of the proposed project, and to identify all viable mitigation efforts. I1-1

This comment letter is to point out two inter-related project aspects – to highlight possible ground water hydrology impacts due to aggregated factors, and to note the lack of specificity and comprehensive analysis of improvements to the West Drainage Canal. At the end of this comment letter we will link these two issues.

Regarding ground water hydrology impacts, we note that some elements are not analyzed, and others are analyzed in isolation, without consideration of their combined and possible multiplier impacts – for instance, due to changes in vegetation. For example, page 4.5-16, "Effects of Cutoff Walls on Existing Groundwater Wells," notes restrictions on movement of ground water. Elsewhere in the document, numerous mentions of additional wells are noted (for example, page 2-61 notes that irrigation wells may be needed to be established for woodland groves; page 4.7-2 discusses creating managed marsh for giant garter snake, again creating a demand on ground water hydrology.) Most significantly, missing from the discussion is the impact on near- I1-2

surface groundwater moisture from the creation of significant earth "borrow" depressions. Although hillside hydrology is complicated, it is our general understanding that such terracing has an impact: that "upper terraces" dry out more than "lower terraces." Because our approximately 3 acre ranchette – as well as our neighbors – are on the "upper terrace" near significant proposed "borrow areas" and are planted in home orchards, and depend on well water for our domestic use as well as irrigation, we have concerns about the cumulative impact of the various ground water hydrology elements, mentioned above, notably potential additional pumping required to maintain our private property or well failure.. We believe the draft needs to delineate these elements better, and to use a systems approach to look at these elements in combination.

I1-2 (Con't.)

Regarding the lack of specificity and comprehensive analysis of improvements to the West Drainage Canal, we note several deficiencies. The part of that waterway east of El Centro Road, between Arena Blvd and Peregrine Park / I-5 seemingly is never mentioned. That omission is particularly troubling because that section of the waterway has the same habitat limitations mentioned elsewhere (for example, page 2-60 notes "...mostly barren, steep banks with little or no cover or foraging habitat...") Additionally, the report fails to note, for that same section of the waterway, the existence of several significant open public lands with potential for design integration for West Drainage Canal habitat improvements. Those existing public lands include 1) Witter Ranch State Historical Park / San Juan Reservoir park, 2) Red Tail Hawk Park, and 3) Peregine Park. The reports also fails to mention the recreational use of the entire West Drainage Canal, the levies of which are used for biking and strolling by many residents. Additionally, the report fails to note the impending completion of a crucial link in Sacramento bikeways, tying into the West Drainage Canal and Peregrine Park (see Sacramento Bee, June 6, 2010, "Groundbreaking held for Natomas bike bridge link" – ironically, that article mentions that construction will stop for several months to accommodate the hibernation season of the giant garter snake, one of the objectives of the NLIP). Design attention to this section of the West Drainage Canal is also important because the CH2MHill analysis of giant garter snake records, as part of their Revised Natomas Basin HCP (their Figure 12), charts existence of the species in this area.

I1-3

I1-4

I1-5

As mentioned previously, we believe these two concerns are actually linked. We believe that an element in mitigating the ground water hydrology issues above are contained in improvements potentials to the West Drainage Canal. The very elements that improve habitat (see page 2-60 – "..sloped banks supporting native sedges and rushes at the shoreline..." and "...a variable width submerged bench located within the bank, which would support a band of tules...") would also improve ground water percolation recharge. The existence of public open spaces which could accommodate slight widening of the canal in spots to achieve this goal seems to be an opportunity that the NLIP should not overlook. For the very few significant, privately owned open space parcels contiguous with the West Drainage Canal (such as the parcel on Arena Blvd. that backs up to the canal), perhaps strategic land use design stipulations could accommodate such habitat improvements before they are precluded by development.

I1-6

I1-7

We hope that these comments further improve the draft.

Sincerely,

Jorge Jimenez, Ph. D.
Ron Selge

I1-1 See responses to comments I1-2 through I1-7.

I1-2 **Effects on groundwater from cutoff wall installation.** These potential impacts were addressed under Impact 4.5-c, "Effects on Groundwater," of the DEIS/DEIR and in a report prepared by Luhdorff & Scalmanini, Consulting Engineers (LSCE) (LSCE, May 4, 2009) entitled *Evaluation of Potential Groundwater Impacts Due to Proposed Construction for the Natomas Levee Improvement Project* included in Appendix C2 of the DEIS/DEIR. That report was updated in a technical memorandum entitled *Potential impacts of Slurry Cutoff Walls Proposed for Phase 4B of the Natomas Levee Improvement Program* (LSCE, January 28, 2010) included in Appendix C4 of the DEIS/DEIR. Both reports concluded that groundwater flow reductions due to proposed cutoff walls would be small and not have significant impacts on groundwater conditions anywhere in the Natomas Basin, including on the productive capacity of private wells.

Effects on groundwater from groundwater supply wells developed for created habitat. The Phase 4a EIS/EIR (Impact 4.5-c) addressed the potential impacts on groundwater from installation of groundwater wells to support both managed marsh in the Fisherman's Lake area as well as woodland corridors. The Phase 4b Project does not propose additional groundwater wells beyond those wells that were analyzed in the Phase 4a EIS/EIR. Details can be found in the technical memorandum, *Potential Impacts of Proposed Phase 4a Habitat Mitigation Wells* (LSCE, August 5, 2009), included in Appendix C5 of the Phase 4a EIS/EIR. That analysis was updated for the Fisherman's Lake area in a second technical memorandum, *Potential Impacts of Proposed Fisherman's Lake Marsh Wells* (LSCE, October 30, 2009), included in Appendix C6 of the Phase 4a EIS/EIR. Both reports concluded that the proposed habitat mitigation wells would not have significant impacts on nearby private wells in the Fisherman's Lake area.

Effects of borrow site excavation on groundwater levels beneath adjacent properties. For borrow sites that would not be converted to managed marsh, removal of borrow material would not affect groundwater levels because the final grade of the reclaimed borrow areas would still be above the water table. In the case of borrow sites that would be converted to managed marsh, removal of borrow material below the water table would also not result in lower groundwater levels because water levels would be managed by importing sufficient water to replace water lost to evapotranspiration from marsh vegetation and open water areas. Surface water levels in the managed marsh proposed for the Fisherman's Lake area would be maintained at elevations of 13–14 feet, which are several feet higher than the average underlying groundwater levels. As a result, infiltration from water in the managed marshes would actually result in a slight increase in underlying groundwater levels.

I1-3 Improvements to the West Drainage Canal east of Fishermans' Lake, including the urbanized section east of El Centro Road, are not part of the NLIP and were therefore not analyzed as part of the Phase 4b Project.

I1-4 Because no improvements would be constructed along the West Drainage Canal east of Fisherman's Lake, recreational uses along this section of the canal would not be affected and were not analyzed as part of the Phase 4b Project.

Temporary changes in recreational opportunities during project construction activities are addressed in Impact 4.13-c, "Temporary Changes in Recreational Opportunities during Project Construction Activities" of the DEIS/DEIR. The West Drainage Canal, which is shown on Plate 2-17 of the DEIS/DEIR, is owned and operated by RD 1000 and is not a designated public recreational facility (see Plate 3-7 of the DEIS/DEIR). Any incidental use of this canal for recreation (e.g., walking or bicycling) would only be affected during construction, and public recreational facilities in the vicinity of the West Drainage Canal, such as Fisherman's Lake Parkway and Open Space, would be available as substitutes.

I1-5 West Drainage Canal improvements designed to improve habitat for giant garter snake are described in Section 2.3.4.1, "West Drainage Canal Habitat Improvements," of the DEIS/DEIR. 4.7-e, "Giant Garter Snake Mortality, Injury, and/or Disturbance to Habitat" of the DEIS/DEIR addresses impacts to giant garter snake.

I1-6 Because Impact 4.5-c, "Effects on Groundwater," of the DEIS/DEIR concludes that no significant groundwater impacts would occur with implementation of the Phase 4b Project, no mitigation is necessary.

I1-7 See response to comment I1-3.

Jew, Deborah

Dear: Ms. Holland: Thank you for your response. The inclusion of habitat mitigation adjacent to our agricultural property causes great concern because of past problems we have had farming adjacent non agricultural parcels. The affects of damages from insects, rodents and birds is unimaginable. In the case of certain corps, we have suffered total loss farming next to non farmed parcels. I2-1

Thank you;
John Perry

MEMO LETTER

Date: July 23, 2010

To: USACE; Attention Elizabeth Holland

From: John Perry, Perry Farms

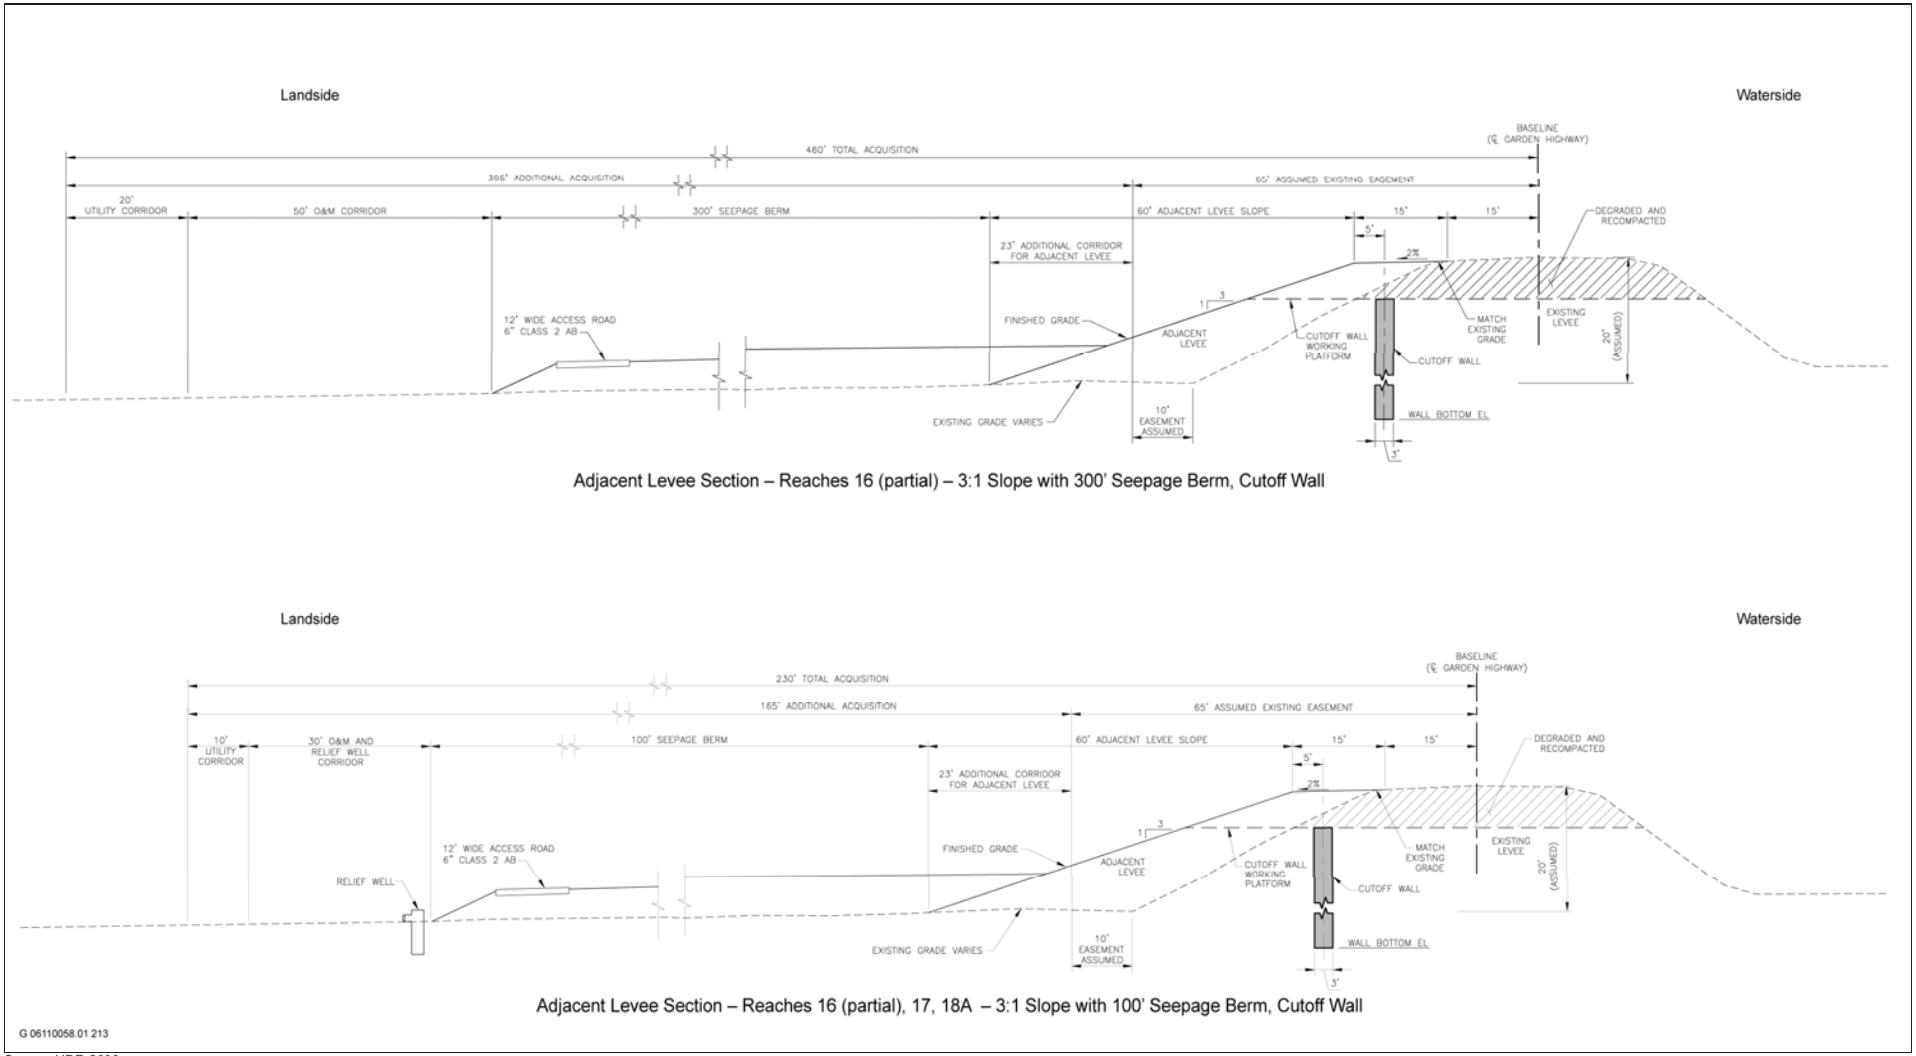
Re: Natomas Phase 4B project

Per out review of the DEIS/DEIR we have questions as to the physical and financial impact of the project on our farming operation. We will start with a description and physical location of our operation, in order for the CORP of Engineers has an understanding of the affects of this project on our operation.

The operation is located south of the Fisherman's Lake and farms approximately 1,000 acres. The operation has been in existence since the 1930s. The operation farms a variety of crops including wheat, corn, safflower, sunflower and fresh market vegetables. A substantial amount of the acreage farmed is located along the Garden Highway. A majority of the fresh market vegetables are grown on property along the Garden Highway. A large portion of irrigation water is serviced from the Riverside Canal. I2-2

In order to plan the future of the operation, we need some clarity as to the timing and foot print of the project. The following is a list of questions that we have in order to plan how to deal with the project:

1. What is the foot print of the project? I2-3
2. What are the dates anticipated for the initial physical occupation of the project foot print and the anticipated duration? I2-4
3. What are the dates and duration of the relocation of the Riverside Canal I2-5
4. What is the physical design and location of the River Canal? I2-6
5. How will irrigation water be serviced to the area while relocation and construction work occurs? I2-7
6. What are the location of the borrow sites? I2-8
7. Between the project's foot print and the barrow sites, there will be a substantial reduction in acreage being farmed by our operation; what provisions are being made to address the economic impact on our farming operation. I2-9
8. Substantial compaction of soils will occur as result of the construction activities and relocation of canals. What factors are being considered to address this long term affect on agricultural activities? I2-10
9. The relocation of the canals and levee construction will change the landscape of the area. What provisions are being made to eliminate the creation of habitat for rodents, noxious weeds and insects? I2-11
10. Farming requires the movement of farm equipment, between various parcels. Are provisions being made to address ingress and egress while construction is occurring? I2-12



Source: HDR 2009

Cross-Sections – Sacramento River East Levee Reach A:16–18A **Plate 2-8a**

I2-1 Because the commenter is not specific about the location of his agricultural property, it cannot be confirmed whether habitat would be located adjacent to it. However, comment I2-2 indicates that the property is located south of Fisherman's Lake. The construction of habitat in the Fisherman's Lake area, as part of reclamation of soil borrow sites, was addressed in the Phase 4a EIS/EIR (see Plate 2-12 of the Phase 4a EIS/EIR for the conceptual plan). All habitat established as part of this complex would be located north of Radio Road. Following excavation of borrow material, borrow sites within the Fisherman's Lake area would either be developed as managed marsh or returned to agricultural use, such as growing hay or alfalfa. Except for the marsh, which would be managed as habitat for giant garter snake, no parcels in the Fisherman's Lake area would be unfarmed.

I2-2 Comment noted.

I2-3 The Phase 4b Project components are shown in the following plates in the DEIS/DEIR:

- Plates 2-7a and 2-7b (Sacramento River east levee Reach A:16–20),
- Plate 2-9 (American River north levee Reach I:1–4),
- Plate 2-11 (NEMDC North),
- Plate 2-13 (PGCC),
- Plate 2-14 (NEMDC South),
- Plate 2-16 (NCC),
- Plate 2-17 (West Drainage Canal and West Lakeside School Site), and
- Plate 2-19 (Potential Woodland Planting Area in Lower Dry Creek).

While the above plates show the proposed locations of the Phase 4b Project components, the exact project footprint has not been finalized. The DEIS/DEIR discloses the worse-case effects (i.e., greatest potential impacts) of the Phase 4b Project, and thus evaluates a larger project footprint than would actually occur. USACE is in the process of awarding a contract to begin detail designs of the Phase 4b Project, and detailed designs and footprints should be available in 2011. USACE will work with landowners over the next year to configure the Phase 4b Project with the least potential impacts to the public. If impacts are determined to be significant beyond what has been disclosed in the EIS/EIR, a supplemental NEPA/CEQA document will be prepared.

I2-4 The Phase 4b Project is anticipated to begin construction in 2012 and be completed in 2016. All work by USACE will be based on Congressional authorization and funding.

I2-5 See response to comment I2-4 for overall construction schedule. Relocation of the Riverside Canal is planned to occur in 2012 (as shown in Table 4.11-1 of the DEIS/DEIR).

I2-6 A conceptual alignment of the relocated Riverside Canal is shown in Plate 2-7a of the DEIS/DEIR. Detailed design of the Riverside Canal has not been finalized. USACE will work with landowners over the next year to configure the Phase 4b Project with the least potential impacts to the public. If impacts are determined to be significant beyond what has been disclosed in the EIS/EIR, a supplemental NEPA/CEQA document will be prepared.

I2-7 Mitigation Measure 4.15-a, "Coordinate with Irrigation Water Supply Users Before and During all Irrigation Infrastructure Modifications and Implement Measures to Minimize Interruptions for Supply," of the DEIS/DEIR requires the project proponent(s) to coordinate with water supply providers and consumers to minimize interruptions, conduct work during the nonirrigation season whenever feasible, and ensure that essential water supply necessary during the irrigation season is provided by an alternative supply if an interruption is unavoidable.

I2-8 The borrow sites identified in the DEIS/DEIR are all potential borrow sites for the Phase 4b Project (see Section 2.3.3.4, "Borrow Sites," Tables 2-22 and 2-23, and Plate 2-6 in the DEIS/DEIR). However, USACE is still in the process of determining the exact amount of borrow material that would be required. If additional borrow sites are needed, supplement NEPA and/or CEQA documentation will be prepared.

I2-9 See response to comment I2-8. See also response to comment O4-16 regarding NEPA and CEQA requirements to analyze economic effects.

I2-10 The soil compacted by construction activities can be scarified such that the compaction densities match pre-construction densities.

I2-11 RD 1000 and SAFCA will be responsible for maintaining the new canals and levees after completion of the project. Common practice includes filling in rodent holes, mowing and spraying weeds, and providing vector control.

I2-12 Access routes for farming will be maintained during project construction, as they will be maintained for all landowners in this reach.

RE: Natomas Levee Improvement Program
Construction Staging Area for Lease

Dear Ms. Holland,

My name is Imogene W. Amrine and I own a 10 acre parcel at 2520 Garden Highway (APN: 274-0250-040-0000). Physically my parcel is located 1 mile south of San Juan Road on Garden Highway.

This 10 acre parcel was leased from me in the past and used as a construction staging area during levee improvements. It has electricity, well water and a driveway (over the irrigation ditch) that was constructed for heavy loads. I3-1

The parcel is available for lease immediately and throughout the Natomas Levee Improvement Program. Please let me know who I should talk to with regards to the possibility of leasing out my parcel.

Enclosed is a parcel map with my parcel highlighted and an aerial photo of the parcel.

Sincerely,

Imogene W. Amrine

RE: Comments related to the Phase 4b Project of the NLIP

Dear Ms. Holland,

Thank you for the opportunity to offer comments regarding the DEIS/DEIR for the above-referenced project.

My residence of the last 21 years abuts the RD1000 Main Drainage Canal and is located within one block of the project area described as Reach 19b. I4-1

During my tenure in Natomas, I have been subject to slurry wall construction, pumping plant improvements, and additional cutoff-wall construction that have created noise, dust, and traffic nightmares. I4-2

As currently presented, this project will unduly and negatively impact the quality of life for every resident who lives within a mile of this project's footprint, both during construction and for years after.

Schematics of the levee "improvements" indicate that in this heavily populated area, we will soon face slopes denuded of mature trees, new retaining walls, months-long road closures, and seemingly endless noise and dust. I4-3

This project also reeks of wasted tax dollars.

Dollars wasted on earlier levee work now deemed inadequate. Dollars wasted tearing-up recently completed cutoff-wall work at pumping plant #1 so outfall pipes can be reconfigured. Dollars wasted on over-building an already adequate levee system. I4-4

This project will simply destroy the existing visual character of the project area. I4-5

I am a minority voice to be sure as we can assume that ninety-nine percent of the population of Natomas cares only about not having to pay for flood insurance. What those of us who live in the actual construction area have to go through while this project is undertaken makes no difference. The fact is, those in charge will look at these and any other comments provided, shrug their shoulders, then do what *they* believe to be in the best interests of the community, contrary viewpoints be damned. I4-6

I just don't have that much faith that SAFCA, the USACE, or any other government agency involved in this project truly knows what they are doing except a desire to turn the Sacramento River into a drainage ditch, ala the Los Angeles River. There must be better ways to achieve the results being dictated to us by USACE. I4-7

Sincerely,

Phil Perry

I4-1 Comment noted. The commenter lives within the Phase 4b Project area.

I4-2 Comment noted. Construction projects may result in noise, air quality, and traffic impacts.

I4-3 The intent of EISs and EIRs is to provide information related to a proposed project, disclose potentially significant impacts and to propose mitigation measures to reduce potentially significant impacts. The DEIS/DEIR outlines the anticipated temporary and long-term impacts associated with the Phase 4b Project (for reference see Table ES-2, "Summary of Impacts and Mitigation Measures" of the DEIS/DEIR). Impacts resulting from vegetation removal (e.g., Section 4.7, "Biological Resources" and Section 4.14, "Visual Resources"), increased traffic (Section 4.10, "Traffic and Transportation), noise (Section 4.12, "Noise"), and dust (Section 4.11, "Air Quality") are discussed in detail in the DEIS/DEIR. Where feasible, mitigation measures are proposed that would reduce impacts to the maximum extent possible.

I4-4 See response to comment O4-16 regarding NEPA and CEQA requirements to analyze economic effects.

In general, because levee operation and maintenance is an on-going process, and engineering standards and flood zone designations change over time, levee systems will require upgrades and reconstruction. The adequacy of Federal levee systems is based upon guidance developed by USACE. The Phase 4b Project is proposed to meet those requirements. Section 1.4, "Project Purpose/Project Objectives and Need for Action," in the DEIS/DEIR provides information related to the project purpose and objectives, according to USACE and SAFCA (Section 1.4.1, "Project Purpose/Project Objectives"), background reports used in support of the need for levee reconstruction (Section 1.4.2, "Need for Action"), and deficiencies in the Natomas Basin levee system that contribute to the problems and needs related to project implementation (Section 1.4.2.1, "Flood Problems and Needs").

I4-5 In Section 4.14, "Visual Resources" of the DEIS/DIER, USACE and SAFCA acknowledge that implementation of the Adjacent Levee Alternative (Proposed Action) and the Fix-in-Place Alternative would result in adverse effects on scenic resources and the visual character of the Sacramento River east levee, American River north levee, and NEMDC South. This change in visual character would be attributed to the removal of a substantial number of trees, including large mature trees and Heritage oaks, from the landside and waterside of these levees. As stated in the DEIS/DEIR, Impact 4.14-a, "Alteration of Scenic Vistas, Scenic Resources, and Existing Visual Character of the Project Area," is considered to be significant. Although Mitigation Measure 4.14-a, "Implement Mitigation Measures 4.7-a, 'Minimize Effects on Woodland Habitat; Implement all Woodland Habitat Improvements and Management Agreements; Compensate for Loss of Habitat; and Comply with Section 7 of the Federal Endangered Species Act, Section 1602 of the California Fish and Game Code, and Section 2081 of the California Endangered Species Act Permit Conditions,' and 4.13-b, 'Compensate City of Sacramento Department of Parks and Recreation for Loss of Parkland and Park Amenities'," in the DEIS/DEIR would reduce adverse effects, it would not be to a less than significant level and this impact would be considered significant and unavoidable.

This FEIS/FEIR will be used by the SAFCA Board as a decision making document to, in part, determine if the significant and unavoidable environmental impacts out-weigh the economic, legal, social, technological, or other beneficial impacts of the project. If the SAFCA Board determines that the significant environmental impacts are considered to be "acceptable" when compared to the benefits of the project, a statement of overriding considerations will be prepared providing the substantial evidence that was used to reach this conclusion (State CEQA Guidelines CCR Section 15093).

I4-6 Comments received on the DEIS/DEIR are addressed in this FEIS/FEIR. Comments will be used for consideration of certification of the EIR and issuance of a Record of Decision by the SAFCA Board and USACE, respectively.

I4-7 See response to comment I4-4.

Subject: Phase 4b Landside Improvements Project

Ms. Holland:

What is the current design criteria for water elevations

in the Sacramento River at Verona,
in the Natomas Cross Canal,
in the Pleasant Grove Creek Canal?

I5-1

What was the original design criteria for water elevations

in the Sacramento River at Verona,

in the Natomas Cross Canal,

in the Pleasant Grove Creek Canal?

When the river elevation at Verona is higher than the elevation of the Western Pacific Railroad, water from the tributaries of the Natomas Cross Canal system are blocked and are forced to flow north and south along the east side of the Western Pacific Railroad, flooding the area from Coon Creek to Sankey Road. The winter of 2009-2010 brought significant storms to the east Valley and west slope of the Sierra region, yet no significant flooding occurred in the Pleasant Grove area. The river at Verona never reached a 30 foot elevation and the Natomas Cross Canal system worked.

I5-2

Various "improvements"in the river system in the past 100 years such as straightening levees and channels up stream brings water to Verona faster. Improvements down stream such as levees around "islands" in the Delta and building houses, docks, bridges, etc. in the water side of the river reduce flow capacity. The gradient from Verona to the Delta is nearly zero to begin with.

I5-3

How can the river elevation be reduced in heavy storm conditions?

* Increase Sacramento River flow capacity.
* Make the River wider and deeper.
* Remove levees from "islands" in the Sacramento River Delta. I5-4
* Increase upstream storage capacity.
* Curtail drainage pumping by reclamation and drainage districts during periods of high river flow conditions. These districts should have internal retention facilities.

Please acknowledge receipt of this message.

Respectfully submitted,
Melvin Borgman
3559 Howsley Road
Pleasant Grove, CA 95668

I5-1 The NLIP is designed to the state of California standard as defined in Senate Bill 5 (SB 5). SB 5, signed by the Governor in October 2007, defines the State standard of the mean annual 200-year flood with at least 3 feet of freeboard between the water surface elevations and the top of the levees around the Natomas Basin. For purposes of modeling these water surface elevations, it was assumed that the levees protecting other areas in the system will not fail even if overtopped. As indicated in Table 4.5-4 of the DEIS/EIR, the 200-year no levee failure water surface elevation in the Sacramento River at Verona is 42.6 feet NGVD 29.[2] This water surface elevation rises very slightly (less than 0.1 foot) along the length of the NCC and in the PGCC due to the control exerted on water levels in these water bodies by conditions in the Sacramento River under this condition.

The original design criteria for the Sacramento River for the reach of the Sacramento River from the mouth of the NCC to the Sacramento Bypass is based upon a historical flow of 107,000 cubic feet per second (cfs). The flow was used to generate what is known as the "project floodplain," also known as the "1957 profiles." The profiles show that the "project floodplain" elevation at the mouth of the NCC is 41.2 feet C.E.[3] (or 38.2 feet NGVD 29).

The original design criteria for the NCC and PGCC are set forth in *Design Memorandum No.2, Sacramento River Flood Control Project California, Back Levees for Reclamation District No. 1000 and No. 1001 Levee Construction* dated August 1, 1957. This memorandum reflects USACE's consideration of two possible design conditions affecting flows and water surface elevations in the NCC and PGCC. "Condition A" was based on a combination of a 'moderate' stage 39.0 feet C.E. (or 36.0 feet NGVD 29) in the Sacramento River and an estimated 200-year flood flow from the creek group feeding into the NCC. Under Condition A, design flows on the NCC and PGCC equated to 27,000 cfs and 7,000 cfs, respectively. "Condition B" was based on the "project floodplain" elevation (41.2 feet C.E.) in the Sacramento River described above and an estimated 50-year flood flow from the creek group feeding into the NCC. Under Condition B, design flow on the NCC and PGCC equated to 22,000 cfs and 6,000 cfs, respectively. The Condition B flow line controlled in all cases and was therefore adopted as the project floodplain.

USACE noted in the memorandum:

> This project flood plane provides full protection of rapidly developing urban lands in Reclamation District No. 1000 from flood conditions of project flood magnitude (estimated frequency of once in 200 years). All other lands east and north of the project levees are agricultural lands that are not expected to become urban within the foreseeable future and therefore do not require such a degree of protection. The 3-foot freeboard[4] used for the design of the levees represents a considerable factor of safety for the following reasons. The adopted flood plane rises only about 1.5 feet from the Sacramento

[2] NGVD29 = National Geodetic Vertical Datum of 1929.

[3] C.E. = U.S. Corps of Engineers Datum, C.E. datum is 3 feet below mean sea level (MSL). MSL is roughly equivalent to NGVD29.

[4] The left bank of the Sacramento River at the mouth of the NCC had a top of levee elevation of 45.9 C.E. according to the 1957 profiles. The water surface at that location is 41.2 C.E., which equates to 4.7 feet of freeboard, much greater than the 3-foot design. The levees were built before the 1957 profile design and in general have greater than 3 feet of freeboard.

River to the head of the main canal and its elevation is dominated by the 41-foot starting elevation [C.E datum] in the Sacramento River. This starting elevation cannot increase significantly because any material increase in upstream Sacramento River flows would inevitably cause extensive upstream levee failures which would allow large volumes of water to escape from the channels and prevent further rise at the mouth of the Natomas Cross Canal.

I5-2 Comment noted.

I5-3 Comment noted. See Attachment 4 of the Appendix C to the Natomas PACR for discussion regarding sensitivity to downstream conditions.

I5-4 Hydraulic analyses of the river system conclude that dredging of the Sacramento River channel does not provide long-term peak flow capacity. SAFCA has previously considered this concept and concluded that it would not improve flood water conveyance or control during peak flood conditions.

Removing levees from islands in the Delta would not appreciably influence flood elevations in Natomas. See response to comment I5-3.

Section 2.1.5, "Alternatives Considered, But Eliminated from Further Consideration," of the DEIS/DEIR addresses expansion of the Yolo Bypass and use of upstream transitory storage to reduce water surface elevations.

Pumping capacity of drainage facilities are small compared to flood flows within the channel system and therefore flood elevations could not be appreciably reduced. Flow from interior drainage facilities were ignored in generating design channel water surface profiles.

Subject: NLIP Phase 4b

Ms. Holland:

I have concerns regarding the proposed relocation of the Morrison Canal.

As you are aware, that canal supplies irrigation water to the C. Morrison Ranch as part of the Natomas Mutual Water Company system. The proposed relocation of the canal will separate a large portion of our property on the west side of SR99 from the remaining portion of the "west side" property. The proposed relocation will create a small section of land to the north of the new canal that will be difficult to cultivate, irrigate and harvest compared to the current situation. It will also cut off access to the remaining property from a well that is located in the north east corner of our property on the west side of SR99.

The proposed relocation will also isolate the northwest corner of our property on the east side of SR99 making that portion of the ranch difficult if not impossible to farm. Our supply pump from the present location of the Morrison Canal is in that northwest corner and feeds an underground pipeline that runs from there almost to the eastern border of the ranch near the "fig tree". That is a relatively new system completed in 2005.

As pictured in Plate 2-16 the proposed relocation appears to also pass through our equipment shed and the house located near it. I6-1

It is my understanding that the proposed relocation is a seepage related issue. If the levee improvements in that area included seepage controls, why is it necessary to relocate a ditch that would "catch" seepage if any occurred?

A significant portion of our ranch was lost to the improvements to SR99, including the addition of the Howsley Road interchange, and the previous relocation of the Morrison Canal to it's current location. Additional loss of property and the inconvenience of farming around the relocated canal will create a financial burden.

Respectfully submitted,
Charlotte Borgman
C. Morrison Ranch
P.O. Box 771
Pleasant Grove, CA 95668

I6-1 Plate 2-16 in the DEIS/DEIR is schematic in nature. As detailed plans and specifications are developed for relocation of Morrison Canal, specific impacts will be evaluated and mitigated as necessary.

Ms. Holland and Mr. Bassett,

Attached are my comments on the DEIS/DEIR. I am also putting a hard copy in the mail today addressed to Ms. Holland.

Thanks for the opportunity to comment.

Subject: Comments on July 2, 2010 Draft EIS/EIR; American River Watershed Common Features Project/Natomas Post-Authorization Change Report/Natomas Levee Improvement Program, Phase 4b

Dear Ms. Holland,

My name is Roland L. Candee and I live on the Garden Highway in Sutter County. I object to the U.S. Corps of Engineers giving permission to SAFCA to proceed with the project, via previous authorization(s) or via any new authorization(s). It is obvious that the whole approach is flawed for reasons set out in detail in my previously submitted written comments, all of which are incorporated herein by reference. I7-1

For example, the project as it relates to the Natomas Levee has been pushed through in pieces under a claim that somehow each segment has "independent utility" – all this directly in the face of people such as myself pointing out that pieces of this project as it relates to the Natomas Levee raising have no more independent utility than one wall to a bathtub has independent utility. It now appears that the Natomas Levee raising project will not be completed anytime in the near future because of funding issues, leaving levee waterside land owners such as myself receiving all of the burdens without any complete flood protection flowing to the Natomas Basin. This approach makes a mockery of 40 C.F.R. Section 1508.25's requirement that an agency consider the effects of connected actions within a single EIS. Would the SAFCA board really have approved moving forward originally if they knew there was not enough money to complete the project? It seems perfectly realistic that the SAFCA board would have looked to expend resources on projects that could realistically be completed and not go after projects that couldn't realistically be completed. An obvious place to potentially spend less money to get to the same result would have been to lower the elevation of the Fremont Weir, taking pressure off the portion of the Sacramento River in issue with the Natomas Levee raising project. I7-2

For another example, pushing the project through in stages makes it effectively impossible for a member of the public (such as myself) to track all of the various issues and positions that a public agency such as SAFCA has taken. I went to SAFCA's offices and asked for a hard copy of this latest draft EIS/EIR so that I could try and compare what is currently written with three or four prior EIS/EIR documents and I was told the materials are only available on CD. While I appreciate the volume, I simply don't have the time or manpower available to personally print out everything and go through the comparison of the multiple voluminous documents. If the agencies had followed the legal requirement that all of the effects of connected actions be tracked within a single EIS, then I would not be left in an effectively impossible situation to accomplish a review. I could look at one document and see what, if anything, I needed to comment on. I7-3

For another example, what is the real target for how high the Natomas Levee must be raised? Prior environmental documents took the position that the needed levee height was up to three feet higher than the current Garden Highway levee elevation. I now read in your latest document that the "up to three feet higher" amount is not sufficient and the target has moved to a standard that is expressed as the 200 year flood elevation plus three feet of elevation plus an allowance for wave run-up plus an additional foot for climate change. While I do not believe that any judicial officer will have any trouble ultimately reaching the obvious conclusion that raising the levee shifts the risk of flooding from those inside the basin to those immediately outside the levee, the process of submitting this large project through in various pieces for review creates many legal issues. Would the SAFCA board really have approved moving forward originally if they knew the levee raising was going to need to immediately be followed with a subsequent project to raise the levee even higher? The obvious answer is that the SAFCA members are rational thinking, serious board members who would have been bothered by an approach that effectively damned waterside levee residents such as myself to multiple levee raising projects one after another. I7-4

Even past the consideration of inappropriately approaching this as multiple independently viable levee raising projects, the Attachment 5 to the Natomas Post-Authorization Change Report is very relevant in revealing the absurdity of taking the position, as the SAFCA board has done, that raising the levee doesn't transfer flood risk to the property of waterside land owners such as myself. If I have properly read the analysis (and I must concede that I7-5

it is confusing as written), then it appears that SAFCA is now taking the position that they (SAFCA) can legally proceed with post-authorization changes as long as there are not hydraulic impacts on the river beyond those previously authorized. Hence, despite the current admission that up to three feet of levee raise isn't going to be enough (i.e., the needed raise has gone to three feet above the 200 year flood level plus an allowance for wave run-up plus one foot for climate change), the post-authorization change report can go through and be approved because SAFCA is not technically asking for authority to raise the Natomas Levee beyond the "up to three feet" previously approved. Ironically, the reasoning as expressed in the position paper focuses on levee height as the obvious main criteria that triggers a transfer of risk and a requirement of mitigation/inverse condemnation acknowledgment. The specific language contained in the position paper notes that "(f)ix-in-place levee improvements that do not change the geometry of the hydraulic cross section, **including existing levee height** (emphasis added), would not effect the flood event hydrograph." Additional language notes that "there is no requirement for mitigation for improvements **that do not raise the height of the levee** (emphasis added)." The position paper admits that raising the levee would be "a transfer of risk of flooding from the project area to another area." How can SAFCA now admit that raising the levee is a fundamental transfer of risk yet when this levee raising was originally approved, no transfer of risk for the "up to three feet" of levee raise was ever acknowledged? The obviousness of this levee raising equals condemnation/transfer of risk tie is further revealed in the fact that this draft EIS/EIR justifies no condemnation/transfer of risk on the American River portion of the overall project specifically on the grounds that there is no raise in the height of the levee!

I7-5 (Con't.)

The current draft EIS/EIR appears to continue to concede that the numbers show a rise in the river elevation level in the vicinity of my property as a result of the project, albeit a small amount and under flood conditions. I continue to object to SAFCA's choosing originally to use a .1 foot standard as an apparently claimed de minimis amount of rise in elevation when the true standard is that development must not cause any rise in base flood elevation levels. I continue to object to SAFCA apparently then changing the de minimis amount to fit with what modeling shows is present under a 500 year flood event. Even if a court allows an agency to get away with setting a de minimis standard, that agency should not be allowed to later change the chosen de minimis standard amount. 500 year flood events do happen. I also note that even if some de minimis standard is

I7-6

used, there is no way to avoid the fact that the Natomas Levee project as actually constructed is now revealed to include moving and raising the Garden Highway in the vicinity of where Sankey Road has been relocated to intersect with the Garden Highway just south of where the Natomas Cross Canal joins the Sacramento River. Where the Garden Highway originally ran has now been obliterated, but it appears to me that the actual levee height is, in places, well over six feet higher than the height of the original Garden Highway and the relocation of the Garden Highway to the east is an obvious change in the hydrology of the Sacramento River channel just upriver from my property. Such actual changes to the hydrology should logically require SAFCA to admit that the project inversely condemns my property.

I7-6 (Con't.)

It is now obvious that water will be added to the channel via several drains that are already in place just north (upstream) from my property. The size of the drains is obvious and can be readily measured. Surface water that previously flowed away toward the inland side of the Garden Highway is now to be directly added to the Sacramento River just north of my property. The prior SAFCA engineer, Joe Countryman, assured the SAFCA board that there was no valid claim being presented by waterside land owners because "not a drop of water" was to be added to the river. One of the SAFCA board members, on the day SAFCA approved moving forward with the levee raising project, publically told the waterside land owners present at that meeting that our claims were not being recognized by SAFCA because "not a drop of water" was to be added to the channel. Now we subsequently find out that 23 drains' worth of surface water is being directly added to the channel. Would SAFCA have authorized proceeding in the manner previously approved by SAFCA if SAFCA board members had not received the express assurance of staff that "not a drop of water" was being added to the river? With the benefit of hindsight, it is clear this "not a drop of water" argument was simply a way (now admittedly not based on true facts) to deflect the board's thinking away from the obvious transfer of risk that comes with raising the levee.

I7-7

A prior comment submitted a couple of years ago (July 2008) resulted in SAFCA taking the position that *Orpheum Building Company v. San Francisco Bay Area Rapid Transit District* (1978) 80 Cal.App.3d 863, 871, was SAFCA's legal authority for taking the position that there is no claim for inverse condemnation of my property present under these facts. *Orpheum* involved a situation where the absence of any trespass was stipulated to by the parties at trial, there was no physical entry onto the

I7-8

property during construction, there was no contemplation that the project would result in physical invasion of the property in the future, and the jury heard the evidence that there was a special benefit of a value of over $100,000 (proximity to a new BART station) that flowed to the property as a result of the project. Those are not the facts present here in regard to my property and the Natomas Levee raising. There will not be a stipulation of "no trespass" when my case is tried. In fact, I have photos showing that the construction has included physically placing a monitoring box on my property, an actual trespass that I would expect SAFCA to admit and acknowledge as being a physical entry onto my property during construction. Additionally, the data shows that my property will be subjected to more frequent flooding with flood levels elevated, albeit in small amounts if the SAFCA data is to be believed, from the prior pre-project status quo. And I do not believe that there is any special benefit of any nature that flows to my property as a result of the project.

If, as I contend the evidence shows, my property is being effectively inversely condemned, then I am entitled to be compensated as required by law. My belief is that SAFCA's delay in acknowledging the inverse condemnation has significantly increased my damages. An argument can be made that the date of the take is no later than the date SAFCA's board originally authorized the project to proceed. I believe my immediate neighbor had his property on the market at the time of the SAFCA original board action for approximately $1.7 million. That property has remained on the market for almost the entire time since the original SAFCA board action and is now on the market for less than $1 million. The levee project's existence appears to be the obvious answer for why the property hasn't sold. I7-8 (Con't.)

Under the circumstances, as a minimum, any permission, permits, or authorization granted by the U.S. Army Corps of Engineers allowing the Natomas Levee project to proceed should require SAFCA to admit that the property of myself and my neighbors who live on the waterside of the current Garden Highway in areas where the levee is being raised is being inversely condemned and SAFCA should proceed as required by law in an inverse condemnation situation.

Roland L. Candee

Sacramento, CA 95837

I7-1 See responses to comments I7-2 through I7-8.

I7-2 USACE and SAFCA have prepared the NLIP environmental documents, including the DEIS/DEIR, in accordance with NEPA and CEQA, in particular the tiering provisions (see Section 1.5, "Environmental Regulatory Framework and Relationship of this EIS/EIR to Other Documents," of the DEIS/DEIR). USACE and SAFCA have strived to ensure that the NLIP environmental documents are understandable to decision makers and to the public, while still containing the level of detail necessary for a robust and technically adequate analysis aimed to withstand legal scrutiny. To help facilitate clarity, the NLIP environmental documents, including the DEIS/DEIR, include numerous plates, tables, and formatting considerations that explain and illustrate the relationship of the Phase 4b Project to the entire NLIP.

As explained in Section 1.1.1, "Scope of Environmental Analysis," of the DEIS/DEIR, the DEIS/DEIR is tired from and incorporates by reference the previous NLIP environmental documents. As explained in Sections 1.5.1, "National Environmental Policy Act," and 1.5.2, California Environmental Quality Act," of the DEIS/DEIR, this approach is encouraged by both NEPA (see, e.g., CEQ Regulations, 40 CFR Section 1500.4, 1502.21) and CEQA. CEQA requires tiering whenever feasible as determined by the lead agency, and authorizes lead agencies to treat large and complex, phased projects first in a general program-level analysis and then analyze subsequent actions within the program at a project level of detail while incorporating by reference (see California PRC Sections 21068.5, 21093, 31094). CEQA provides numerous alternative ways to accomplish the purposes of tiering (see, e.g., the State CEQA Guidelines CCR Sections 15152, 15157, 15168, 15385; see also CCR Section 15150 [incorporation by reference]). Thus, by tiering, the environmental effects associated with an entire suite of related actions are analyzed to the extent possible in a program-level document, and then specific actions within the program are analyzed at a project level when sufficient detail exists to perform project-level analysis.

USACE and SAFCA analyzed the impacts of the entire NLIP, including cumulative impacts, in the Phase 2 EIR (SAFCA 2007) and Phase 2 EIS (USACE 2008). Because this very large project is a phased project, as disclosed in the Phase 2 EIR and EIS, subsequent documents analyze the impacts of the Phase 3, 4a, and 4b Projects. Because USACE and SAFCA considered the impacts of the Phase 4b Project, incorporating by relevant program-level analysis by reference as authorized by NEPA and CEQA, USACE and SAFCA have considered the entirety of the Phase 4b Project and its relationship to the larger NLIP, of which it is a project phase, in the manner expressly provided for by NEPA and CEQA. The DEIS/DEIR, and all previous NLIP environmental documents, examined the cumulative effects of the NLIP and the Phase 4b Project consistent with the requirements of NEPA and CEQA. Because the effects of the entire NLIP have been disclosed in program-level documents, and the impacts of the NLIP and project phases have been analyzed in relation to the cumulative context, there is no factual basis to support the contention that the NLIP has in any way been piecemealed or segmented.

The comment regarding the methods for project funding is not a comment on the DEIS/DEIR. If there is insufficient funding for the Phase 4b Project, it will not be built and the identified environmental impacts will not occur.

The proposed alternative that would provide flood control by increasing flooding of the Yolo Bypass previously was considered and rejected as infeasible. See Section 2.1.5, "Alternatives Considered, But Eliminated from Further Consideration," and Appendix B1 of the DEIS/DEIR.

I7-3 See response to comment I7-4. See also response to comment O4-1.

I7-4 The comment suggests that the target elevation for minimum levee heights in Natomas (i.e., 200-year flood elevation plus three feet of freeboard) has changed. This comment is supported by reference to the following statement in the Natomas PACR (page 2-12):

> [t]he State has established a preliminary draft of a standard for urban flood protection in California. This standard would require levees to have a top elevation equal to the mean 200-year water surface profile, plus three feet of freeboard, plus an allowance for wave run-up, plus one foot to account for climate change.

This "preliminary draft standard" is not being used in Natomas, where the target elevation for minimum levee heights remains the 200-year flood elevation plus three feet of freeboard. This is made clear in the Natomas PACR (page 4-9) which states,

> [i]n establishing the design levee crown profile, a freeboard of three feet above the 200-year design water surface elevation or the existing levee crown elevation profile (whichever is higher) was used by SAFCA…Wind and wave run-up and setup were evaluated and determined to be contained within freeboard…

I7-5 As noted in response to comment I7-4, there has been no change in SAFCA's design levee crown profile for the NLIP. As discussed in Section 4.5.2, "Impacts and Mitigation Measures," of the DEIS/EIR, raising the levees to achieve this design standard would have no significant effect on water surface elevations in the Sacramento River channel in the vicinity of the NCC. Table 4.5-4 in the DEIS/DEIR compares existing conditions to conditions with the Phase 4b Project in place, and indicates a net change of 0.01 feet for the 200-year flood with or without levee failures upstream or across from Natomas. For the 500-year flood, Table 4.5-8 in the DEIS/DEIR indicates the change would be 0.03 assuming levees upstream or across from Natomas fail when overtopped. This is a reasonable assumption considering that the over topping would affect over 33 miles of levee as indicated in Table 4.5-2 in the DEIS/DEIR.

I7-6 See responses to comments I7-4 and I7-5. As discussed in Section 5.1.5.15, "Visual Resources," of the DEIS/DEIR, levee sections in up to 15 locations along the Sacramento River east levee would be raised an additional 2–4 feet beyond the design levee crown profile to accommodate project features such as pipeline crossings and roadway intersections. For example, the text notes that:

> Where Sankey Road intersects Garden Highway in Reach C:1, the adjacent levee, which was constructed in 2009 as part of the Phase 2 Project, is an additional 3–4 feet higher for a length of approximately 40 feet, with 100–150-foot-long transitions on both sides back to the typical adjacent levee profile.

These undulations were taken into account in the hydraulic modeling and impact analyses referenced in the responses to comments I7-4 and I7-5. The contention that the "true standard" for hydraulic impact analysis is "that development must not cause any rise in base flood elevation levels" was addressed in responses to comments made by the commenter in connection with the Phase 4a Project (see response to comment I4-2 in the Phase 4a FEIS). There it is noted that "[t]he Sacramento County Floodplain Management Ordinance…states that…0.1-foot change in base flood water surface elevation shall be considered to be zero impact."

See also response to comment I7-8 regarding inverse condemnation.

I7-7 The total peak discharge to the Sacramento River from for all proposed storm drains (Station 0+00 to Station 665+00) is estimated to be 104 cfs. This is a small fraction of the flow carried by the river channel, which is in excess of 110,000 cfs, and would have no measurable effect on water surface elevations in the channel.

I7-8 See response to comment O4-16 regarding NEPA and CEQA requirements to analyze economic effects.

In the example given by the commenter, the monitoring box is within the street right-of-way, which will be confirmed by SAFCA. The monitoring box is for noise and vibration monitoring for the Phase 2 Project, as required by Mitigation Measure 3.12-a, "Implement Noise-Reducing Construction Practices, Prepare a Noise Control Plan, and Monitor and Record Construction Noise Near Sensitive Receptors," in the Phase 2 EIR. The box will be in its current location temporarily, until the end of the construction season. Therefore, there are no reasonably foreseeable economic effects on the commenter's property. With regard to whether the commenter's property will be subject to increased flooding as a result of project implementation, see responses to comments I7-4, I7-5, 7-6, and I7-7.

The NLIP will, in fact, benefit properties on the waterside of Garden Highway, like the commenter's, by preserving trees and encroachments because construction of the adjacent levee will allow these encroachments to remain in place, and by reducing the likelihood that the levee will fail and cut off access to those properties. As an additional benefit, the new levee-top roadway will have improved safety for drivers who use it for access.

To the extent that property must be acquired to implement the Phase 4b Project, USACE and SAFCA would comply with all applicable legal requirements.

I8

Keith M. Seegmiller

Sacramento, CA 95833

16 August 2010

Mr. John Bassett, Director of Engineering
Sacramento Area Flood Control Agency
1007 7th Street, 7th Floor
Sacramento, CA 95814

Subject: Draft EIS/EIR
NLIP, Phase 4b

Ref.: APN 225-0210-022-0000

Dear Mr. Bassett:

The following comments relative to the Subject Draft EIS/EIR are submitted in accordance with the procedures stated on page ES-23 of the DEIS/DEIR.

Specifically, these comments address certain issues and certain potential mitigation measures applicable to landside properties situated in Reach 16 and the Southern portion of Reach 15. Within this area there are at least five -- and possibly an additional one or two-residential properties. (Since I have not yet had the opportunity to discuss these matters with my neighbors, I am presently speaking only for myself.) I8-1

1. The entire NLIP Project has as its objective preventing potentially catastrofic consequences resulting from what are - BY DEFINITION - episodic flooding events. Since I have lived in my home on Garden Highway - for thirty-three years - such events have happened only twice -- 1986 and 1997.

2. In my reading of the Subject DEIS/DEIR, I have not found any discussion of of the installation of "Relief Wells." If I am mistaken, I would appreciate being directed to the appropriate sections of The DEIS/DEIR. (I am referring, of course to "Relief Wells"relative to Reaches 15 and 16.) I8-2

3. My understanding is that, within Reaches 15 and 16, both active alternatives involve the construction of "barrier walls." ... PLUS the creation of I8-3
* an "adjacent levee" AND untold hundreds of thousands of cubic yards of soil for multiple acres of "berm" to a possible depth of nine feet.

4. I believe that "Relief Wells" (in addition to a barrier wall and a single "Adjacent levee") are much more effective in mitigating the results of episodic flooding than millions of tons of dirt built on the assumption that tonnage will sufficiently compress the underlying soils to <u>prevent</u> underseepage. I8-4

* <u>Not</u> true for the "Fix-in-Place" alternative

--Ongoing, annual well maintenance and repair work for the "Relief Wells" can be billed/assessed to the beneficial properties (in lieu of the up-front capital costs of property acquisition and dirt hauling).

-- On Garden Highway, we are familiar with the operation of domestic water wells and the expenses of maintaining tham. (We are also familiar with the deeper water supply wells drilled by the local farmers into the natural water table for irrigation water.) In 33 years, I believe I have had occasion twice (maybe three times) to do underground well maintenance -- and that for 24/7/365 water service. (I understand that the "Relief Wells" would be significantly deeper, which could entail higher maintenance charges.) I8-4 (Con't.)

-- In other words, please deal with the potential problems of "underseepage" WHEN THEY OCCUR! Remove the water. Don't just pile tonnage of dirt on top of the existing soils.

5. In addition, I am the custodian of five (5) Heritage Oaks on my property. I believe that some significant consideration should be given to preserving these trees. An extensive "berm" - to the depth of nine feet -- would clearly kill them. I8-5

6. I have been a participant in a few informal conversations concerning the possibility/feasibility of installing such "Relief Wells" along this stretch of approximately one-half mile. I have not yet been aware of any in-depth analysis/consideration of this alternative for this location. I8-6

(Again, if I am mistaken, please direct me to the appropriate documents.)

I respectfully request that detailed consideration and analysis of the alternative of (1) Adjacent levee, (2) barrier wall**, and (3) Relief Wells be given thorough consideration -- in consultation with the affected property owners. I8-7

Respectfully submitted,

Keith M. Boegmiller

** I also remember that a (INADEQUATE) barrier wall was constructed along this portion of Garden Highway in the late 1980s &/or early 1990s.

I8-1 See responses to comments I8-2 through I8-7.

The Phase 4b Project objectives are described in Section 1.4, "Project Purpose/Project Objectives and Need for Action," of the DEIS/DEIR.

I8-2 The footprint for levee improvements that are proposed to be constructed in Sacramento River east levee Reach B:15 are described in the Phase 4a EIS/EIR. Final design is ongoing for this project phase, and the exact locations of relief wells, if any, have not been finalized.

For Sacramento River east levee Reach B:16, Table 2-2 in the DEIS/DEIR notes that relief wells are a potential element. Relief wells would be constructed at selected locations where berms cannot be wide enough or cutoff walls deep enough to meet the required design parameters for seepage remediation. The need for relief wells in Sacramento River east levee Reach B:16 would be determined during final design. Each of the seepage remediation methods, including relief wells, are discussed in Section 2.1.3.2, "Seepage Remediation," of the DEIS/DEIR.

I8-3 Comment noted. See Chapter 2, "Alternatives," of the DEIS/DEIR.

I8-4 Comment noted. See response to comment I8-2.

I8-5 Impact 4.7-a, "Loss of Landside and Waterside Woodland and Shaded Riverine Aquatic Habitats," of the DEIS/DEIR addresses loss of oak woodland, including Heritage oaks. Table 4.7-2 in the DEIS/DEIR provides an estimate of the acreage that would be lost if the maximum levee improvement footprint (see Plates 2-7a and 2-7b in the DEIS/DEIR) were to be constructed. A woodland compensation plan is described in Section 2.3.4.2, "Woodland Compensation," in the DEIS/DEIR and this impact is also addressed by Mitigation Measure 4.7-a, "Minimize Effects on Woodland Habitat; Implement Woodland Habitat Improvements and Management Agreements; Compensate for Loss of Habitat; and Comply with Section 7 of the Federal Endangered Species Act, Section 2081 of the California Endangered Species Act, and Section 1602 of the California Fish and Game Code," of the DEIS/DEIR.

I8-6 See response to comment I8-2.

I8-7 See responses to comments I8-1 through I8-6.

John Bassett, P.E.
Director of Engineering
Sacramento Area Flood Control Agency
1007 7th Street, 7th Floor
Sacramento, CA 95814

Dear Mr. Bassett,

RE: Natomas Levee Improvement Program Phase 4b Landside Improvements Project

Subject: Draft EIS/EIR Comments

I am a homeowner within the River Oaks Community Association (ROCA) and my property is located within 800 feet of Garden Highway. After review of the Draft Environmental Impact Statement/Draft Environmental Impact Report dated July 2, 2010, I have several concerns that carry over from my comment letter based on my review of the NOP. I9-1

- **Power pole relocation** (page 2-30)- Relocating power poles to the waterside of the existing levee is acceptable, but it is preferred that they be undergrounded and placed at shallow depths above the 0.005 AEP flood surface elevation similar to the reconstructed pump station discharge pipes. Any above grade facilities can be placed on either side of the road. Relocating the existing land side power poles from the top of the levee down to the bottom of the slope is not acceptable. These are a real eyesore to put into our neighborhoods that were built to specifically avoid these and are a serious concern. I9-2
- **Seepage berm, up to 250' wide in addition to the adjacent levee construction at Tim Lewis** -. It appears that the berm and its grade transitions will extend all the way to the sidewalk along Wheelhouse Avenue.
    - Confirm the treatment to the top of it. A combination of natural park to replace the lost trees in the grove at the west end with manicured park is desired, including incorporation of a community park which has been planned near the I-80 crossing. I9-3
    - Provide beautification at the 12' wide transition slope behind the sidewalk. Leaving the existing temporary ditch that is weed filled and a magnet for trash is unacceptable as a permanent solution.
- **Existing Bike Trail along Swainson Way** (Upper figure on Page 2-101)-
    - Widening the levee and removal of the existing walk/bike path along the south side of Swainson Way/Avocet Court is an unacceptable loss. This is a heavily used pedestrian route in our community, and this path provides an important access between the Shorebird and Warmington subdivisions. It in part acts as an informal extension of Shorebird Park. I9-4

- Utilization of the future bike trail at the top is unacceptable, replacement of this path at the levee toe elevation is a must.
  - There will not be sufficient access points to provide similar access between Avocet and Marina Glen.
  - Using said trail would not only be highly inconvenient given the grade differential, but it would also be unsafe given the proximity to the very high speed traffic on Garden Highway.
- The retaining walls proposed through here need to be further setback and the height increased in order to maintain a minimum 6' wide walk along this stretch.
  - The retaining walls must not be a plain masonry unit or similar construction, and a design which will not attract graffiti. Rockery (Parson's) stone gravity walls as used in Folsom would be acceptable as they are less prone to graffiti, and provide a natural blending that a masonry unit wall does not. Should masonry unit be used, veneers and other architectural details that match other walls in the development need to be used.

I9-4 (Con't.)

- **Shorebird Park** (Upper figure on Page 2-101)-
  - Shorebird Park must be reconstructed to replace any walks, trees, or other amenities removed or otherwise disturbed by the construction. Loss of the walk along the south side is unacceptable.

I9-5

- **City of Sacramento Pump 160**
  - The drive access from Garden Hwy must be reconstructed as needed. Access from the residential area to Garden Hwy is an important connection for this immediate neighborhood, particularly with the loss of the old driveways at Marina Glen.

I9-6

- **Access at W. River Drive/Wheelhouse Avenue**
  - This drive access from Garden Hwy must also be reconstructed as needed. This provides a key access from the residential area to Garden Hwy as well as to Sand Cove Park across the street from the access.

I9-7

Please incorporate these comments into your documentation. If you have any questions, please feel free to contact me via email or USPS mail.

I9-8

Sincerely,

Ronald Johnson, P.E.

I9-1 See responses to comments I9-2 through I9-8.

I9-2 Detailed engineering specifications, including the relocation of power poles, will be developed during final design. The options described by the commenter are still under consideration.

I9-3 Detailed engineering specifications will be developed during final design.

I9-4 The DEIS/DEIR addresses the potential environmental impacts of a worst-case levee improvement footprint. Approaches to avoiding encroachment on public facilities would be considered during final design. Mitigation Measure 4.13-c(1), "Prepare and Implement a Bicycle Detour Plan for All Bicycle Trails and On-Street Bicycle Routes, Provide Detours for Bicycle Facilities, and Coordinate with City and/or County Departments of Parks and Recreation to Repair of Damage to Recreational Facilities," requires coordination with local jurisdictions to restore access and repair or reconstruct any construction-related damage to bicycle facilities.

I9-5 See response to comment L5-4.

I9-6 See responses to comments L3-3 and L5-4.

I9-7 See responses to comments L3-3 and L3-4.

I9-8 See responses to comments I9-1 through I9-7.

PUBLIC HEARING

PH

Clerk:
Our next Item is a Timed Item:
Item 1 Public Hearing – Draft Environmental Impact Statement/Environmental Impact Report on the American River Watershed Common Features Project/Natomas Post-Authorization Change Report/Natomas Levee Improvement Program Phase 4b Landside Improvements Project

Tim Washburn:
Mr. Tretheway, Members of the Board, Tim Washburn, Director of Planning. This is a Public Hearing item, an opportunity for folks in the community to offer comments on the joint Environmental Impact Report/Environmental Impact Statement that was issued on July 2nd by the Corps, with the cooperation of the Central Valley Flood Protection Board and SAFCA. I am going to give some brief comments, take any questions the Board may have, and then ask you to open it up and take any comments that may be for the public.

So as the Board is aware, I mean this is the sixth environmental document that we have issued in the last three years. We started as you recall, in the beginning of 2007, with a program EIR that looked at the entire 200 year protection plan for SAFCA that was the basis for our forming the assessment. We followed up with a Project Level but also Program Level look at the Natomas Levee Improvement Program. Later in 2007, an EIS that complemented that document was issued at the beginning of 2008 and since then we have of course, issued two more Environmental Impact Reports and Environmental Impact Statements.

This is unprecedented, that we have been able to maintain this pace in analyzing these problems and proceeding with these documents through the process. And now we have arrived at a point where we believe this is the last document in the series, and it is a document that will cover the transition from the SAFCA led project, which is where we have been for the last three years, to the Corps coming on the scene and taking over the Project and commencing to construct the remainder of it.

So just to remind the Board, our environmental documents will bring us along and we've completed most of the Natomas Cross Canal. We have a substantial amount of the Sacramento River east levee done. We expect that we will be awarding a final contract on our part to carry us down past Powerline Road into the vicinity of Fisherman's Lake and from that point forward, we will hand the baton, by in large, to the Corps. So this document covers the elements of the Project that we have not yet evaluated in the five previous documents, at a level of detail and so that is the lower part of the Sacramento River east levee, essentially from San Juan Road down to I-5; the American River north levee from I-5 over to Northgate; and then

the upper part of the Natomas East Main Drain west levee, from Elkhorn up to Sankee Road. All other pieces of the perimeter were analyzed in prior documents, so this one focuses on those reaches and analyzes the impact of the Project there, but it also adds some elements that we've picked up from prior documents that weren't analyzed.

In particular, we are going to be re-aligning and altering the slope on the RD 1000 west drainage cannel from I-5 over to Fisherman's Lake. We are going to be doing some work along Pleasant Grove Creek Canal Levee that was not analyzed in prior documents, in particular, we have to either remove or improve five culverts that drain water from the Pleasant Grove area into Natomas and we still need to raise the Pleasant Grove Creek Canal levee slightly, about a foot, and we need to raise a portion of the Natomas East Main Dain west levee at the upper end, about a quarter mile or maybe a half mile.

The rest is levee strengthening. And so nothing that the Board hasn't heard about, cut-off wall construction where that is feasible, we do have to on the east side of the basin along the NEMDC west levee, probably widen that levee section because it is over steepened on the waterside and to be stable, it needs to be widened and that will require us probably to relocate Natomas East Levee Road and it should be noted, we are now going to be getting into a more heavily populated part of Natomas.

We have generally been operating in the northern and western part of the basin which is basically agricultural. As we get down the Sac River east levee, the parcels get smaller on the landside and for the first time, we will be confronting the challenges of improving the levee where there are urban subdivisions. And so this document foreshadows those challenges, evaluates those impacts and offers mitigation measures for the impacts that may result. We are going to most likely be removing a lot more landside trees. Those of you who have driven along the Garden Highway, in the Reach between the RD 1000 office and say down to the Arden/Garden, or say Northgate, there is a lot of trees at the landside tow of the levee there and this document suggests, analyzes and anticipates that those trees will have to be removed as part of the design of the Project, in order to flatten the back slope of the levee and in order to meet Corps requirements for maintaining Operation and Maintenance Roadways, at the toe of the levee.

Those trees will be mitigated within the corridors that we have been creating as part of our Project and also a substantial mitigation in the document, is anticipated in Lower Dry Creek where SAFCA and the City of Sacramento own substantial lands there, that will accommodate 40 to 50 acres of mitigation in Lower Dry Creek. But there will be trees taken out that are now close to where people now live and that will be a challenge for us.

We also face the challenge of dealing with all of the infrastructure that passes through and over the levees as you get into these urban areas: electrical/utility lines; natural gas lines; water mains; storm water facilities, these will pose major challenges to our design and construction capability and these also are analyzed in what we have referred to as the Phase 4b Document.

This is going to be a challenging part of the Project. We are happy that we have the Corps of Engineers to be able to step up to this challenge and of course we will assist them in every way we can. The purpose of this item is to appraise you of the issuance of this document, which occurred on July 2, and there is a 45 day document period that will remain open until August 16th. We will then quickly respond to any comments that we receive on the EIS/EIR and issue a Final EIS/EIR in the early part of September. It will go through a 30 day review process as is required under NEPA. We will then be required to respond to any comments we get on that Final document and bring this document to a position where it can be certified by this Board and approved by the Corps, toward the end of the year.

So that is the process going forward, this is an essential part of our bringing this Project forward for federal authorization and approval and for turnover to the Corps for construction. I would be happy to answer any questions you may have on the scope of this document.

Chairman Tretheway:
Okay I'll see if we have any questions at this time.
Mr. Shiels

John Shiels:
What is the Natomas Levee Class One Bike Trail Project?

Tim Washburn:
The, that project is a county sponsored project and the county, the Department of Transportation, specifically approached us and requested that we include in the description of the Project, the eventual construction of a bike trail on the adjacent levee that we are constructing around Natomas. We thought that was a reasonable request and so it is being included in the Environmental Document for environmental coverage. It is going to be up to the County of Sacramento, working with the City to advance that project forward in terms of actual permitting and construction.

John Shiels:
So we are not expecting to spend any, commit any funds…

Tim Washburn:
No, it is not in the SAFCA NLIP, it is an additional project that the County and the City would sponsor.

John Shiels:
Okay. I want to be sure that if that project goes forward, that it is understood that there are conditions that RD1000 has, that must be met.

Tim Washburn:
Yes, I think we have gained some valuable experience in building the WYDA Bike Trail on the NEMDC west levee. I think we have some experience and background to, to go from there.

John Shiels:
Thank you.

Chairman Tretheway:
Are there any other questions? Tim --this is the second public hearing?

Tim Washburn:
Yes, we had a Public Hearing in the South Natomas Community Center on Tuesday. There will be another one on the 21st I believe, a 3rd Public Hearing.

Chairman Tretheway:
And that is at the County Board of Supervisors?

Tim Washburn:
Yes.

Chairman Tretheway:
The one on Tuesday, what -- anyone show up and any comments?

Tim Washburn:
To be honest, it was not a very large turn out of the public. No. Now I should say, we have by direct mail notification, notified 900 property owners in the footprint of this Project, along the Garden Highway, on both sides of the Garden Highway, and the lower Sacramento River and along the American River north levee. So I don't know whether that suggests that people haven't paid attention to the notice or aren't interested or not sure.

Chairman Tretheway:
Well, it is only 700 pages, right? Okay we have no body signed up today to speak?

Clerk:
That's correct.

Chairman Tretheway:
Anybody? It is an opportunity to fill out the form and speak? Okay sign up afterwards - just introduce yourself and then ... can we help him get a sign up sheet

Clerk:
There is one on the lecturn.

Tim Washburn:
If you would open the Hearing, then we will record the statement

Chairman Tretheway:
Okay, so the Public Hearing is now open.

Phil Perry:
Very good. My name is Phil Perry. I am a resident that lives within about a block of the levee in the Bree/Sisto Rio Development. My property abuts the Reclamation District slough that goes to Pumping Plant 1. PH-1

Couple of concerns, I have not read the whole document, shame on me. What I do notice is the impact that it is going to have on our local area, just as a taxpayer it is a little concerning that we went through a levee improvement project years ago and that seems to have gone for not. So I apologize if I am somewhat reluctant to endorse this project as a local homeowner because I have already gone through this a few times and just recently when, and it kind of concerns me that we just recently filled in the area where the pumping plant is and looking at the document, it would appear that much of that will be taken apart again because they are going to have to raise all of the outlet pipes up and over the levee at the location. PH-2

According to the EIR, the original pumping – or I guess its 2, Number 2, which is in the old building. A lot of those pumps are going to have to be taking out they are going to have to make higher output because they are going to have to get more of a head to get up and over the levee. Strikes me as that is something that could have been looked at when they were filling in the slurry wall that they hadn't completed.

Those are the kind of things that cause me to doubt that this is being viewed in the most strategic way. The trees obviously it is quite sad the idea that one of the reasons I moved to the area is the bucolic look of it and that is going to be stripped clean. We're going to have basically a straight levee that is on La Lima Way there that now we have a number of wonderful trees. The park that is down the street, PH-3

down by Chevy's, I would imagine, that will lose a large portion of trees and it just kind of changes the look of the place. PH-3 (Con't.)

It seems there would be better and cheaper ways to do this, considering the improvements that have been made up river, considering the other improvements that have been made. I just want the Board to ensure they are looking at this as the most cost effective way of actually doing these repairs and make it safe. I also realize that I am also in a quite small minority, because I think you would find that anybody that lives much further away from the levee than I do, doesn't give a darn that it is going to be stripped clean. PH-4

They, there for the first time they started paying flood insurance. I have been paying it for 21 years living over there. It was very nice when it was down to $300 a year, this year we're up to a grand this year and next year we should be down to $300 again, so it's a pretty good deal. The people that live in the interior, that haven't been paying flood insurance, I feel for them, but it's a fairly small price. I am just asking that you guys look at this closely. I realize this is a comment period and I also understand that comments just basically get in the record. I am not sure really what kind of impact it has on the EIR in any way shape or form, thank you. PH-5

Chairman Tretheway:
Thank you Mr. Perry. I do believe I can share with you that your comments that are germain to the EIS/EIR will be replied to in the Final draft. Correct? As is every public comment either written or oral. Stein.

Stein Buer:
I would like to supplement Tim's very good summary by reminding the Board and the public that the document casts an envelope of likely maximum environmental impacts and we will be working with the community, people like Mr. Perry and others, to minimize impacts wherever we can. And we will look at each and every structure to see if there are ways that we can minimize the additional work that needs to be done.

I would also like to mention, overtime, standards have changed. And the work that has been done before has certainly been very effective in improving the level of flood protection in the basin, a comparison of 1986 and 1997 show that we solved the huge problem of water seeping through the levee and causing the backside to erode, but the standards have changed and we have to meet those new standards to maintain or regain our accreditation.

So it is a moving target. And we will always be working on these levees and it can be frustrating that we are back out there over and over again, but that is really the

nature of this system, we will always be working on these levees one way or another to make them better.
Thank you very much.

Chairman Tretheway:
Thank you.
Mr. Gallagher.

James Gallagher:
Yeah, one thing I wanted to add, as another important component of this EIS, is the issues with the Pleasant Grove Creek Canal and a lot of you have been on this Board for a long time, so you know there have always been some issues and impacts to the Pleasant Grove area, in Sutter County. So I know staff has already been very much working with that community, and I know that is a priority for me as well. I know this Board we want to ensure we are good neighbors and that we are working with all these communities that are in some ways impacted by this Project. This Project is a necessity, we are all here to make sure it happens, but we all want to make sure that we address those impacts as they arise.

I do want to thank Stein and staff for working on that issue, and I know as we continue to work through the process, I think we can find a way to ensure that those impacts are fully mitigated.

Stein Buer:
In fact, we do have a Public Meeting scheduled for August 4th, in the Pleasant Grove Creek area. We don't have a location yet, but the last one is not the 21st, it is August 4th, for a total of four Public Meetings on this issue, so those people in that particular area will have a convenient way to express their concerns and learn more about the project.

Chairman Tretheway:
I want to thank James for taking a leadership role up in that community. We'll button this one up finally. Do we need to close Public Hearing? It says information only

So we need to close public hearing with a motion.

Virgina Moose:
So moved.

John Shiels:
Second.

Chairman Tretheway:
Second by Mr. Shiels. All in favor please say "aye"

All:
"I"

Chairman Tretheway:
Any noes or abstenstion?
Thank you.

PH-1 Comment noted.

PH-2 The DEIS/DEIR provides analysis of the maximum environment impacts that could occur under the Phase 4b Project. If Congress authorizes the Phase 4b Project, SAFCA and USACE will prepare the detailed plans and specifications to minimize impacts to existing structures.

PH-3 See response to comment I4-5.

PH-4 See response to comment I4-4.

PH-5 Flood insurance requirements and rates are not determined by USACE or SAFCA. The Federal Emergency Management Agency defines AE zones as areas with a 0.01 annual exceedance probability of flooding. The designation requires mandatory flood insurance purchases by homeowners.

APPENDIX J

USACE and SAFCA Responses to Comments on
Previous NLIP Environmental Documents

J1 Phase 2 FEIR Master Response: Hydraulic Impacts on the NLIP

2 MASTER RESPONSES TO COMMENTS ON THE DRAFT EIR

2.1 INTRODUCTION

The following discussion presents responses to environmental issues raised in multiple comments. These responses have been titled, "master responses," because they address numerous comments concerning the same or very similar topics. These responses are organized by topic to provide a more comprehensive response than may be possible in responding to individual comments. Table 2-1 lists each issue addressed in a master response.

Table 2-1
List of Master Responses

Master Response Number	Title
1	Hydraulic Impacts of the NLIP
2	Biological Resources and Habitat Mitigation
3	Temporary Construction Impacts on Traffic Safety, Noise, and Other Nuisances
4	Utilities Relocation

All individual comments on environmental issues along with individual responses to these comments are presented in Chapter 3, "Individual Responses to Comments on the Draft EIR." In that chapter, the reader is referred back to these master responses as appropriate.

2.2 MASTER RESPONSE 1: HYDRAULIC IMPACTS OF THE NLIP

2.2.1 INTRODUCTION

In response to several comments received on the DEIR that question whether SAFCA's approach to evaluating hydraulic impacts is reasonable, SAFCA has prepared the following master response.

2.2.2 DETERMINING THE SIGNIFICANCE OF HYDRAULIC IMPACTS

CEQA requires lead agencies to determine whether "the proposed project [would] expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam" (State CEQA Guidelines, Appendix G, Section VIII, i). SAFCA has historically made this determination by evaluating the potential effects of its levee improvement projects on water surface elevations in the stream and river channels in the project area and in the larger watershed within which the project is situated. This approach was used to evaluate the flood related impacts of the Natomas Levee Improvement Program (NLIP). Specifically, SAFCA's engineering consultant, MBK Engineers, used a UNET hydraulic computer model to compare existing conditions in the waterways surrounding the Natomas Basin and in the larger Sacramento River Flood Control Project (SRFCP) with and without the project. The analysis consisted of calibrating the hydraulic model to historic flood events using high-water marks and stream gage data, modeling the "with" and "without" project condition under several flood scenarios, and determining whether the proposed project would produce a significant difference in the relevant water surface elevations.

The results of this analysis were initially presented in Chapter 4.4, "Hydrology and Hydraulics," and Appendix C, "Hydraulic Modeling Results," of the program-level EIR on Local Funding Mechanisms for Comprehensive Flood Control Improvements for the Sacramento Area, which was certified by the SAFCA Board of Directors in February 2007. Using the same methodology, the analysis was performed again and presented in Chapter 3.4,

"Hydrology and Hydraulics," of the DEIR for the NLIP Landside Improvements Project. In both cases, the modeling showed that the proposed NLIP improvements would not increase the "1957" water surface profiles that serve as the minimum design standard for all reaches of the SRFCP and would not substantially increase the 100-year or "200-year" water surface elevations in any urban areas upstream or downstream of the project study area. On this basis, both EIRs concluded that the NLIP improvements would not cause any significant hydraulic impacts.

A surface water elevation increase of 0.1 foot was used as a threshold for determining potential a significant impact because it represents a minimum change from existing conditions. As discussed on pages 3.4-6 and 3.4-7 of the DEIR, a 0.0 foot increase in both the "1957," "100-year," and "200-year" water surface profiles would result with implementation of the NLIP Landside Levee Improvement Project.

2.2.3 THE EIR'S TWO-THRESHOLD APPROACH IS CONSISTENT WITH THE FRAMEWORK HISTORICALLY USED TO MANAGE THE SRFCP

The perimeter levee system around the Natomas Basin is part of a larger integrated system of levees, dams, and bypass channels known as the SRFCP that encompasses five historic flood basins in the Sacramento Valley (Colusa, Sutter, Feather, Yolo and American Flood Basins) and the subbasins contained therein. Planning, design, and construction of the SRFCP has been ongoing since the early 1900s under the leadership of the U.S. Army Corps of Engineers (USACE) and the State of California (state), with local levee and reclamation districts playing the principal role in operating and maintaining the system.

Initially, the river channel and bypass levees in each segment of the system were constructed based on a standard geometry. The levees were designed with a predetermined freeboard allowance tied to specified flows and associated water surface profiles generally matched to observed conditions during the 1907 and 1909 floods. Over time, the standard freeboard allowance of each levee section was increased because of numerous levee failures. The minimum standard levee changed from a levee with a top width of 10 feet to one with a top width of 20 feet. In addition, the design flows were modified substantially on the Feather and American Rivers. This was the result of floods that occurred after 1909, which demonstrated these rivers could produce substantially greater flows than occurred during the 1907 and 1909 floods. Because numerous levee failures occurred along the Feather River levees between 1920 and 1934, the levees were set back and enlarged to accommodate greater flows. These changes were summarized in design memorandums, which define the minimum freeboard requirements for each segment of the SRFCP, collectively referred to as the "1957 profile." Over the years, the system capacity of the SRFCP was also greatly expanded by the construction of five major multiple-purpose reservoirs (Shasta, Black Butte, Oroville, New Bullards Bar, and Folsom Reservoirs) containing 2.7 million acre-feet of dedicated flood space.

The record floods of 1986 and 1997 triggered additional system modifications. Although these floods were significantly larger than the 1907 and 1909 floods, the availability of reservoir storage largely prevented flows in the system from exceeding the design of the SRFCP. Nevertheless, numerous project levees experienced unexpectedly severe stress and some failed. This experience caused the USACE, the state, and their local partners to perform a series of geotechnical evaluations on the SRFCP's levees and to adopt new, more rigorous levee design standards for urban areas, including standards for seepage through and under project levees. To meet these new standards, USACE, the state, and local flood control agencies have made substantial investments in addressing identified deficiencies in levees throughout the SRFCP and in improving the level of flood protection provided by the levees, particularly in urban areas.

Although the SRFCP and its design standards have evolved over the years based on experience, new engineering tools and analysis, and changes in public policy, this evolution has occurred within a system management framework that has allowed necessary adaptations to the system without undermining its basic operational principles. These principles are discussed below.

The SRFCP is not intended to provide a uniform level of flood protection (statistical probability of flooding) to the various subbasins within the protected area. Rather, each subbasin is protected by levees that at least meet the SRFCP's minimum geometrical standards, including freeboard reflecting the water surface profile prescribed for that segment of the system. Each subbasin's protection is dependent on the fitness of its own levees and not on the condition (or failure) of any other subbasin's levees. Accordingly, each subbasin has the right to keep its levees in the fittest possible condition to ensure that these levees will perform as reliably as possible in a flood.

2.2.4 EFFECT OF THE NLIP ON SRFCP FUNCTION AND OPERATIONS

Even the most modest levee-tending activity, such as eradicating rodent burrows, has the potential to trigger a "transfer of risk," at least in theory. Yet there are currently no data and modeling tools available to quantify such transfers of risk and assess their significance. One of the SRFCP's most important accomplishments is to avoid this problem by relying on the more practical and measurable indicator of a change in water surface elevation, using this measure as the guideline for evaluating the effects of levee-tending activity. Because the SRFCP is designed to operate as an integrated system based on prescribed water surface elevations, the "transfer of risk" that may occur when a subbasin improves the fitness of its levees is not considered to adversely affect the performance of the SRFCP with respect to other subbasins as long as the improvement activity does not alter any water surface elevations designed by the SRFCP. Under this water surface elevation guideline, levee and reclamation districts can operate and maintain their levees (and thus reduce flood damages without engaging in overly complex "transfer of risk" arguments) unless there is evidence that their levee fitness activities will cause a change in a relevant design water surface profile. If the activities of these levee and reclamation districts would produce a significant adverse change in a water surface profile prescribed by the SFRCP, then the district would be expected to offset the adverse impact.

It is clear that levee-tending activities involving physical changes in the geometry of the river channel are the activities most likely to cause changes in water surface elevations prescribed by the SRFCP. These types of activities include placement of fill or construction of structures in the floodway, construction of new levees, relocation of existing levees, excavation within the floodway, construction of large berms for protecting riverbanks, raising an existing levee (waterside raise), construction of a new bypass, and planting of vegetation within the floodway. Improvement activities on the land side of a levee also require evaluation. Such activities include placing a slurry wall in a levee, adding a seepage berm to a levee, placing a field of seepage relief wells along a levee, raising a levee (landside raise), widening a levee (increase top width), and relocating a seepage ditch.

Three design water surface elevations should be considered when determining whether a levee-tending activity would result in an adverse impact to a SRFCP levee. First, the elevations prescribed for each segment of the SRFCP must be considered. These elevations are referred to as the "1957 profile" and they define the minimum freeboard requirements for each segment of the SRFCP. Second, because of the participation of virtually all communities protected by segments of the SRFCP in the National Flood Insurance Program, the 100-year water surface profile must be considered. Third, because the California Legislature has now established "200-year" flood protection as the appropriate standard of flood protection for all urban areas within the SRFCP, the "200-year" water surface profile must also be considered. (Statutes of 2008, Chapter 364 [adding Water Code Section 9602(i)]).

In determining whether a proposed improvement or activity could result in changes to these water surface profiles, the standard analysis procedure is to use hydrologic and hydraulic computer modeling tools such as, HEC-1, HEC-2, UNET, HEC-RAS, RMA2, FESWMS, etc. The analysis consists of calibrating the hydraulic model to historic flood events using high-water marks and stream gage data. The calibration activity is normally conducted on systemwide instead of a site-specific basis. However, data available for computer model calibration can be sparse or nonexistent. In addition, assumptions must be made regarding reservoir operations. Because all of the reservoirs that contribute to the operation of the SRFCP (Shasta, Black Butte, Oroville, New Bullards Bar and Folsom) are governed by water control manuals issued by USACE, current reservoir operations are assumed

to continue except where it is reasonably foreseeable that the current operation could change (as in the case of Folsom Dam and Reservoir, where Congress has directed USACE to formalize the variable space storage operation that has been in effect by agreement between SAFCA and the U.S. Bureau of Reclamation since 1995).

Once the model is calibrated, the "with project" condition is compared to the "without project" condition under several flow conditions (1957 profile, 100-year FEMA flood, and "200-year" urban flood) to determine whether a difference exists in water surface elevations under these different conditions. This analysis is complicated because, for the 100-year flood and "200-year" flood, it involves assumptions about the performance of project levees under flow conditions that exceed the minimum design of the SRFCP and thus involve the possibility of levee failure. As noted above, the design of the SRFCP was not historically based on assumed levee failures. On the contrary, the design assumed no levee failures but included five engineered diversions and one natural overflow diversion. The natural diversion is to Butte Basin, which is upstream from the SRFCP levees. This diversion did not include flow easements because Butte Basin is a historic flood basin. The five engineered diversions include two diversions to Butte Basin (Moulton and Colusa Weirs), one diversion to the Sutter Bypass (Tisdale Weir), and two diversions to the Yolo Bypass (Fremont and Sacramento Weirs). All of the engineered diversions included the acquisition of property rights to support the diversions. The deliberate planning, construction, and maintenance of the diversions assured that they would function during flood conditions and serve as reliable features of the flood project.

The historic record of SRFCP levees under high flow conditions does not reveal a direct relationship between river stage and levee performance, particularly given the potential for flood fighting activities to influence this relationship. This greatly complicates the challenge of establishing reasonable assumptions on which to conduct hydraulic modeling evaluations. Most hydraulic modeling efforts make the simplifying assumption that a levee fails when the water surface reaches a defined elevation. The most common failure scenarios consider the following:

(a) Assume levee fails when water level exceeds top of levee by 0.5 feet.
(b) Assume levee fails when water level reaches top of levee.
(c) Assume levee fails when water exceeds design stage by 1.5 feet.
(d) Assume levee fails when design stage is exceeded.

The performance of the Reclamation District (RD) 784 levee on the Yuba River highlights the problems associated with these scenarios. This levee has never been overtopped; however, during the 1955 flood, the water surface level reached to within 0.5 feet of the top of the levee and the levee did not fail. Although not quite reaching the limit described by scenario (b), the water surface did exceed the levels specified by scenarios (c) and (d). These scenarios would have incorrectly assumed a levee failure and overestimated the beneficial effect of a levee failure to adjacent or downstream areas during the 1955 flood. During the 1986 flood, the maximum water level was approximately 4.5 feet below the top of the levee; however, the levee failed after the peak stage when the water level was approximately 6.6 feet below the top of the levee. All of the above scenarios would have assumed no levee failure. Because the levee failure occurred approximately 24 hours after the peak stage, the adjacent or downstream areas did not receive any benefit in peak stage reduction. During the 1997 flood, the maximum water level was 2.5 feet below the top of levee and the levee did not fail. Scenario (d) would have assumed a levee failure and would have overestimated the benefit a levee failure would have provided to the adjacent or downstream areas.

The only documented SRFCP levee overtopping that did not result in a levee failure occurred in 1995, when the Cache Creek levees were overtopped by approximately 0.1 to 0.2 feet and did not fail. An extensive flood fight was conducted by the California Department of Water Resources (DWR) forces to save the levee during this event. There were many instances in 1986 and 1997 when a levee did not fail even though scenarios (c) and (d), above, would have predicted failures. These locations were primarily along Feather River, American River, and Yolo Bypass areas in 1997, and Sacramento River, American River, and Yolo Bypass areas in 1986. Extensive flood fight activities took place during these floods. Flood flows were near or exceeded SRFCP design levels

during these floods. It is interesting to note that current USACE design criteria would not find these areas to have "certifiable" levees.

In short, the historic record does not reveal a direct relationship between river stage and levee failure, particularly given the potential for flood fighting activities to influence this relationship. The state holds flood fighting schools annually before the start of the flood season. Participants at the training learn how to construct a temporary levee raise, provide protection to the levee from overtopping and wind and wave attack, and learn how to deal with underseepage (boils).

For purposes of evaluating the hydraulic effects of the NLIP, SAFCA employed levee failure scenario (a), because it is reasonable, practical, is easily understood, and because a sensitivity analysis indicated that the estimated hydraulic characteristics would be the same for each of the level failure scenarios analyzed. In addition, because the NLIP improvements are based on a levee design profile calculated assuming that SRFCP levees do not fail when overtopped, SAFCA added a "no levee failure" scenario to the modeling effort. In each case, the hydraulic modeling study assumed that all SRFCP levees in nonurban areas would be raised to their design heights (designated freeboard above the SRFCP design water surface profile) as part of the state's ongoing levee repair program. Several of these levees overtopped in the 100-year and "200-year" modeling runs. In scenario (d), it was assumed that this overtopping would result in a levee breach with water leaving the adjacent river channel through the breach. In the "no levee failure" scenario, the overtopped levee was assumed to act as a weir, allowing water to leave the adjacent river channel over the top of the levee without a breach occurring. None of the existing NLIP levees failed under either of these scenarios. Accordingly, in both cases it was determined that increasing the height of the NLIP levees would not increase the 1957 water surface profiles in any project reach and would not increase the 100-year or "200-year" water surface elevations in any urban areas upstream or downstream of the project study area.

2.2.5 THE APPROACH USED IN THE NLIP HAS BEEN ADOPTED BY THE STATE LEGISLATURE

In September 2007, the state legislature enacted the Central Valley Flood Protection Act of 2008 (Act), Water Code Section 9600 et seq., which was signed into law by the governor in October 2007. The Act is based on the following findings:

- The Central Valley of California is experiencing unprecedented development, resulting in the conversion of historically agricultural lands and communities to densely populated residential and urban centers.
- The legislature recognizes that by their nature, levees, which are earthen embankments typically founded on fluvial deposits, cannot offer complete protection from flooding, but can decrease its frequency.
- The legislature recognizes that the level of flood protection afforded rural and agricultural lands by the original flood control system would not be adequate to protect those lands if they are developed for urban uses, and that a dichotomous system of flood protection for urban and rural lands has developed through many years of practice.
- The legislature further recognizes that levees built to reclaim and protect agricultural land may be inadequate to protect urban development unless those levees are significantly improved.
- Cities and counties rely upon federal floodplain information when approving developments, but the information available is often out of date and the flood risk may be greater than that indicated using available federal information.
- The legislature recognizes that the current federal flood standard is not sufficient to protect urban and urbanizing areas within flood prone areas throughout the Central Valley.

(Statutes of 2007, Chapter 364, Section 9.)

Based on these findings, the Act embraces a new flood protection standard for urban areas (defined as "developed areas in which there are 10,000 residents or more") located in levee protected floodplains in the Central Valley. This new "urban level of flood protection" is defined as "the level of protection that is necessary to withstand flooding that has a 1-in-200 chance of occurring in any given year using criteria consistent with, or developed by, the Department of Water Resources." (Statutes of 2007, Chapter 364 [adding Water Code Section 9602(i)]).

Consistent with this new state standard, the legislature also approved "the project features necessary to provide a 200-year level of flood protection along the American and Sacramento Rivers and within the Natomas Basin as described in the final engineer's report dated April 19, 2007, adopted by the Sacramento Area Flood Control Agency." (Statutes of 2007, Chapter 641 [amending Water Code Section 12670.14(b)]) Moreover, in connection with this approval, the legislature adopted the following findings and declarations (Statutes of 2007, Chapter 641, Section 1[k]):

> As evidenced by the environmental impact reports certified in connection with these projects, including the hydrology and hydraulics impact analysis set forth in the environmental impact report prepared by the Sacramento Area Flood Control Agency with regard to local funding mechanisms for comprehensive flood control improvements for the Sacramento area dated February 2007, the increase in flood protection associated with improving the American and Sacramento River levees and modifying Folsom Dam will be accomplished without altering or otherwise impairing the design flows and water surface elevations prescribed as part of the Sacramento River Flood Control Project. Accordingly, these improvements will not result in significant adverse hydraulic impacts to the lands protected by the Sacramento River Flood Control Project. Thus, it is not necessary or appropriate to require these projects to include hydraulic mitigation.
>
> The projects authorized in Section 12670.14 of the Water Code will increase the ability of the existing flood control system in the lower Sacramento Valley to protect heavily urbanized areas within the City of Sacramento and the Counties of Sacramento and Sutter against very rare floods without altering the design flows and water surface elevations prescribed as part of the Sacramento River Flood Control Project or impairing the capacity of other segments of the Sacramento River Flood Control Project to contain these design flows and to maintain water surface elevations. Accordingly, the projects authorized in that section will not result in significant adverse hydraulic impacts to the lands protected by the Sacramento River Flood Control Project and neither the Reclamation Board nor any other state agency shall require the authorized projects to include hydraulic mitigation for these protected lands.

SAFCA's hydraulic impact analysis assumes that portions of the levees on the west side of the Sacramento River opposite the Natomas Basin will be raised to meet the minimum freeboard requirements of the SRFCP but not the more rigorous standard for urban development adopted by the state legislature. This assumption is consistent with the current agricultural zoning of the subbasin protected by these levees and with the standards adopted by the legislature in connection with the Central Valley Flood Protection Act, which tie the prospects for urban development in SRFCP subbasins to achievement of at least a "200-year" level of flood protection within the next two decades. (Statutes of 2008, Chapter 364, Sections 1–6.)

Efforts to meet this standard in existing urban and urbanizing SRFCP subbasins (Sacramento, including Natomas; West Sacramento, including Southport; Marysville, including Reclamation District 784 [Plumas Lakes]; and Yuba City, possibly including Live Oak) demonstrate the enormous cost and difficulty of this undertaking, even in areas that start with a substantial urban population. As a practical matter, it is not reasonably foreseeable that the subbasin across from Natomas, which has virtually no population base and a very large levee perimeter that would have to be upgraded, could meet this challenge. Accordingly, it is reasonable for SAFCA's hydraulic modeling evaluation to assume that the levees protecting this area will be raised to meet the minimum standards

of the SRFCP but not the more demanding urban protection standard that has been adopted by the state legislature.

2.2.6 "200-YEAR" FLOOD CRITERIA AND FREEBOARD REQUIREMENTS

The design of the NLIP calls for the Natomas levees to be strengthened to minimize the risk of levee failure caused by the potential for through- and underseepage generated by the water surface elevations around the Natomas Basin that would result from a "200-year" flood event in the Sacramento-Feather and American River watersheds (assuming no levee failures across or upstream from the project area). Although this water surface elevation would be contained by the current perimeter levee system, the NLIP also calls for the levees to have 3 feet of freeboard above this design water surface elevation. This freeboard requirement originates in the regulations of the Federal Emergency Management Agency and the engineering practice of DWR, which has been mandated to develop design standards for providing a "200-year" level of flood protection for urban areas protected by levees in the Central Valley.

This freeboard requirement is intended to address hypothetical uncertainties in levee performance and hydrology and hydraulics. However, its more critical purpose is to address the potential for wind and wave run-up generated by conditions produced by the "200-year" design water surface elevations. An analysis prepared for SAFCA by Mead & Hunt indicates that under reasonably foreseeable wind conditions, this water surface elevation could generate waves up to 2.5 feet in height along the reach of the east levee of the Sacramento River extending from the mouth of the Natomas Cross Canal to Powerline Road. Without the freeboard called for in the NLIP design, these waves could overtop the levee and potentially cause its failure. Thus, the freeboard is needed to ensure safe containment of the "200-year" design flood.

Although it is conceivable that this freeboard could also serve to contain river flows in excess of the "200-year" design, the potential to experience sustained water surface elevations above this level is considered extremely unlikely, speculative at best, and not reasonably foreseeable. While the "200-year" design conservatively assumes no upstream levee failures, it is unreasonable to extend this "no levee failure" assumption to even more extreme flood events. If the upstream levees are assumed to fail in floods greater than the "200-year" event, then the "200-year" "no levee failure" elevation likely represents a worst-case scenario for the Sacramento River channel and the Natomas Cross Canal. For example, SAFCA's modeling shows that a "500-year" flood with upstream levee failures would produce water surface profiles in the Sacramento River channel that would be about 1 foot lower than the NLIP "200-year" design profile, and thus well within the current height of the levee, because the assumed failures allow flood waters to be stored in the upstream floodplains rather than having to be conveyed through the system during peak flow periods.

2.2.7 IMPACTS ON GARDEN HIGHWAY RESIDENCES

The discussion presented in Section 2.2.4 demonstrates that implementation of the NLIP would not cause the SRFCP operations to be altered, therefore, the principal risks of flood damage to existing Garden Highway residences would continue to be either inundation by the water surface elevations that are unchanged by the NLIP or damage by the wind and wave run-up generated during these water surface elevations. In either event, the risk of damage is the same under the "with" and "without" project conditions. Moreover, if under the "without" project conditions, these wind and wave conditions were to fail the Garden Highway levee, some waterside residences could be engulfed by the resulting levee breach, while the rest of these residences would become uninhabitable once the Natomas Basin became fully inundated. Given the severity of the storm that would be required to create these conditions, this inundation would likely last for several weeks, if not months. Interior roadways would be unusable and the landside of the Garden Highway would likely be destabilized by ponded water and wind and wave action. Portions of the roadway would slough away and the entire road would become impassable, leaving Garden Highway residents with no land-based access to their homes. These conditions would be alleviated by the project because the freeboard added to the Sacramento River east levee would prevent a potential wind- and wave-induced levee failure.

2.2.8 CONSIDERATION OF USE OF YOLO AND SACRAMENTO BYPASS SYSTEMS TO CONVEY FLOOD WATERS

SAFCA has given extensive consideration to the feasibility of improving flood water conveyance through the Yolo and Sacramento Bypass systems. In 2003, SAFCA made substantial investments in hydraulic studies and analyses of the improvements that would be required to move more flood water into and through the Yolo Bypass during large flood events in the Sacramento-Feather River watershed to reduce flows and water surface elevations in the Sacramento River channel downstream of the Fremont weir.

The Lower Sacramento River Regional Project Initial Report (SAFCA 2003) indicated that this could be accomplished by widening the Fremont weir, setting back the levees on the east side of the Yolo Bypass, discharging flows into the Sacramento Deep Water Ship Channel and eliminating low elevation levees at the lower end of the Yolo Bypass. However, these improvements would be extremely costly and time consuming to implement; they would occur entirely outside SAFCA's jurisdiction, and would require extraordinary cooperation among affected federal, state, and local interests; and they would not resolve the seepage problems affecting the Sacramento River east levee and the Natomas Cross Canal south levee. For these reasons, as explained in Section 7.1.2.3, "Alternatives Considered but Rejected from Further Consideration," of the DEIR on Local Funding Mechanisms for Comprehensive Flood Control Improvements for the Sacramento Area, SAFCA concluded that this alternative would not achieve the objectives of the NLIP and, therefore, it was not carried forward for further analysis. Nevertheless, regionally oriented improvements to the Yolo and Sacramento Bypass systems are of long-term interest to SAFCA, independent of the NLIP, and SAFCA fully intends to cooperate with any federal, state, or local initiative that has the potential to move such improvements forward.

2.3 MASTER RESPONSE 2: BIOLOGICAL RESOURCES AND HABITAT MITIGATION

Several commenters state that the DEIR does not provide sufficient detail regarding impacts to Swainson's hawks and giant garter snake (GGS) and mitigation for such impacts. This master response is intended to provide more detail of specific impacts and habitat creation and enhancement commitments related to these species for 2008 project activities. Project components to be implemented in 2009–2010 are addressed at a programmatic level in the DEIR, because sufficient detail is not available at this time to address them at a project level. However, the approach used here for 2008 will be repeated for 2009–2010 in subsequent project-level CEQA analyses.

2.3.1 GIANT GARTER SNAKE

In 2008, a total of 243.5 acres of potentially suitable habitat for giant garter snake (240 acres of rice, 1.5 acres of irrigation/drainage canal and ditch, and 2 acres of upland) is anticipated to be permanently lost as a result of project implementation. In addition, a total of 116 acres would be temporarily disturbed (40 acres of rice used for borrow and converted to managed marsh, 1 acre of canal, and 75 acres of upland). To compensate for the habitat effects in 2008, a total of 83 acres of habitat would be created (40 acres of managed marsh, 24 acres of irrigation/drainage canal, and 19 acres of upland adjacent to canals), and 160 acres of existing rice land would be preserved as indicated in Table 2-2.

Table 2-27 of the DEIR has been updated to reflect these acreages.

J2 Phase 3 FEIR Master Response: Sacramento River East Levee Prism and Master Response: 24/7 Cutoff Wall Construction

2.2.2 MASTER RESPONSE: SACRAMENTO RIVER EAST LEVEE PRISM

Several comment letters stated that the Phase 3 DEIS/DEIR did not provide enough information to fully explain the levee prism concept, the adjacent setback levee footprint, and potential construction-related impacts to vegetation and improvements. SAFCA has prepared the following response regarding the levee prism.

Plate 4 shows a typical profile view of the existing levee along the east side of the Sacramento River in comparison to the adjacent setback levee proposed for the Phase 3 Project (Reaches 5A–9B). The prism for the existing levee consists of:

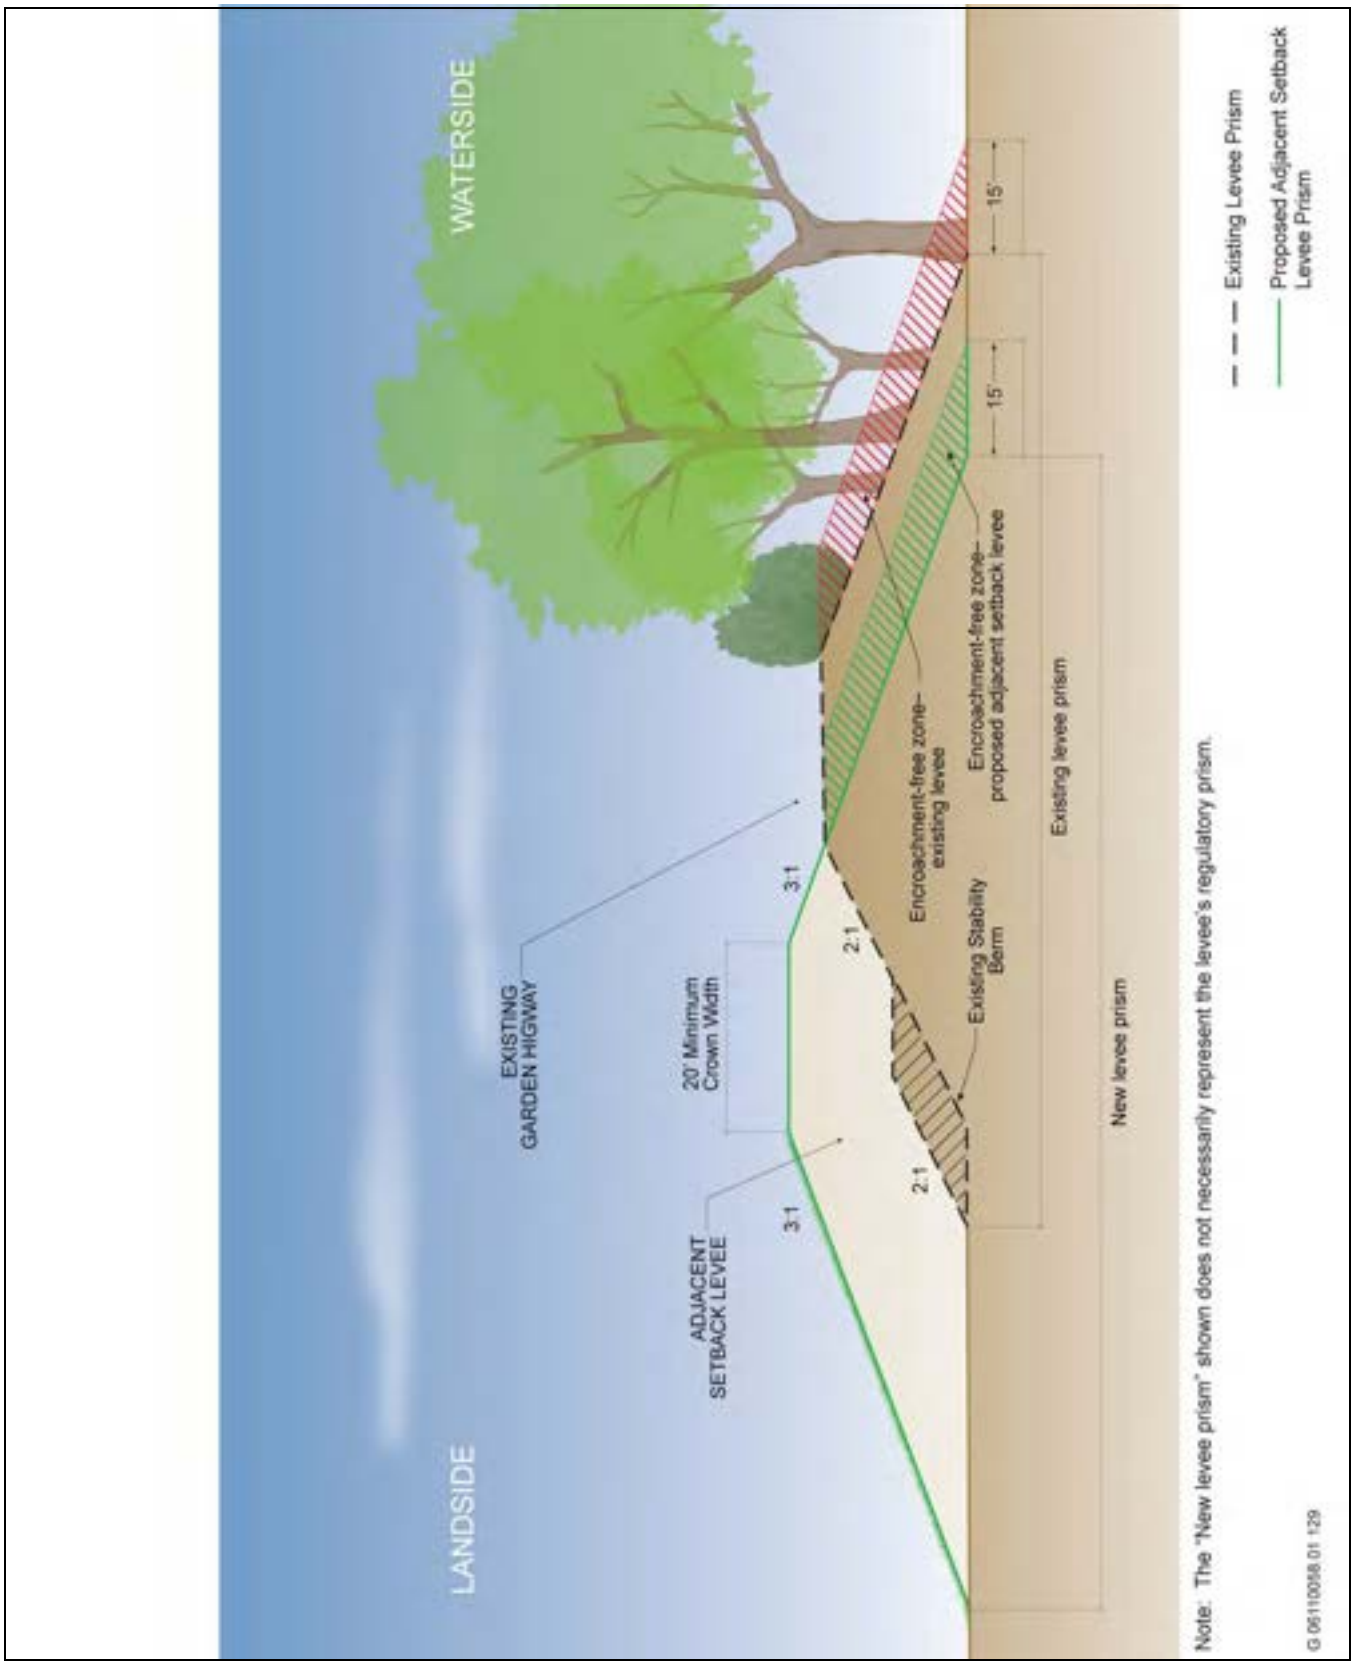
- the levee crown (a minimum of 20 feet wide), on which the Garden Highway currently sits;
- a landside levee slope, typically 2H:1V
- a landside stability berm; and
- a waterside slope that is defined by a projected 3H:1V slope from the waterside hinge point of the levee crown that may or may not be exposed depending upon natural ground surfaces and property improvements, such as construction fill for foundations and driveways.

The prism of the proposed adjacent setback levee would consist of:

- a minimum 20-foot crown,
- a 3H:1V landside slope from the hinge point of the levee crown,
- an exposed upper waterside slope from the hinge point of the adjacent levee crown to the landside of Garden Highway, and
- the continuation of a projected (non-exposed) minimum 3H:1V waterside slope through the existing levee to a point that would be set back a minimum of 15 feet from the existing waterside toe.

The setting back of the Sacramento River east levee under the Proposed Action would provide the USACE-required 15 feet of clearance of encroachments (including vegetation greater than 2 inches in diameter) from the theoretical waterside toe of the new adjacent setback levee. As shown on **Plate 4**, this approach would shift the encroachment-free zone landward, potentially reducing the extent to which USACE, the State, SAFCA, and RD 1000 would require the removal of existing encroachments to meet this requirement under the Levee Raise-in-Place Alternative. The impact of the removal of waterside vegetation greater than 2 inches that would potentially occur in the event of that the adjacent setback levee would not be constructed was analyzed in the Phase 3 DEIS/DEIR under Impact 4.8-a, "Loss of Woodland Habitats," under the Levee Raise-in-Place Alternative. This loss was estimated to be up to 22 acres for Reaches 5A–9B.

As described in Section 2.3.5, "Additional Actions to Meet FEMA, USACE, and State Design Requirements: Encroachment Management," of the Phase 3 DEIS/DEIR, the adjacent setback levee proposed as part of the Phase 3 Project would be designed to significantly reduce conflicts between waterside encroachments and applicable USACE levee operation and maintenance requirements. However, the full extent of this reduction cannot be known until the proposed levee improvements are completed, and USACE, the State, SAFCA, and RD 1000 have inspected and evaluated whether there are any encroachments that affect the integrity of the levee. Section 1.4.2.1,



Source: Adapted by EDAW in 2009 based on data provided by HDR in 2009

Levee Prism Concept for the Sacramento River East Levee **Plate 4**

"Encroachment," in the Phase 3 DEIS/DEIR has been revised to reflect the fact that removal of any encroachments that could be identified as threatening levee integrity would be subject to future environmental review. See Chapter 4.0, "Revisions to the DEIS/DEIR," of this FEIR for the text revision.

2.2.5 MASTER RESPONSE: 24/7 CUTOFF WALL CONSTRUCTION

Numerous comment letters expressed concern about 24 hour-per-day, 7 days-per-week (24/7) construction activities associated with cutoff wall construction. Specifically, commenters requested a more detailed engineering explanation of why 24/7 cutoff wall construction work would be necessary, consideration of using multiple pieces of equipment at once to increase the productivity rate, resident relocation allowances, anticipated duration of potential relocation for residents within 500 feet of construction, and that SAFCA appears to be placing a higher priority on speed rather than environmental impacts. SAFCA has prepared the following response to these concerns.

Normal hours for construction would be from 6:00 a.m. to 8:00 p.m. as stated in the Phase 3 DEIS/DEIR. Installation of cutoff walls during night hours (from 8:00 p.m. to 6:00 a.m.) would be necessary to maintain the construction schedule and install a quality cutoff wall. The 24/7 construction is required due to regional and national demand for the long-stick excavators and deep soil mixing equipment that are needed for cutoff wall construction, the relatively short levee construction window (May 1 through November 1), the potential for wall imperfections that result from sand in the slurry trench settling to the bottom when work progress is interrupted, and the requirement that the cutoff wall be allowed to cure for at least 4 weeks before completing construction of the encapsulating adjacent levee.

It is anticipated that the 24/7 cutoff wall construction would occur Monday through Saturday, with Sunday reserved for equipment maintenance. However, if unanticipated events occur, cutoff wall construction could also be conducted on Sundays. Lights and power generators would be used during nighttime construction hours. Additional equipment would include cutoff wall rigs, excavators, generators, pumps, support vehicles, and other ancillary equipment. The cutoff wall would be installed in several headings. The number and locations of the headings would be dependent on the project schedule and contractor preference. Each cutoff wall rig would move continuously along the proposed alignment to ensure an uninterrupted cutoff wall and to reduce prolonged disturbance to adjacent residences. Each cutoff wall rig can move between 50 and 100 feet horizontally during a twelve-hour work shift.

As stated in the Phase 3 DEIS/DEIR, residents in or near the affected work area would be afforded the opportunity, at SAFCA's expense, to temporarily relocate to a nearby hotel for as long as the 24/7 schedule persists within 500 feet of their residence (see Mitigation Measure 4.14-a, "Implement Noise-Reducing Construction Practices, Prepare a Noise Control Plan, and Monitor and Record Construction Noise Near Sensitive Receptors"). The 500-foot distance was determined to be the distance at which models indicate that noise levels from cutoff wall construction equipment (deep soil mixing equipment or long-stick excavators) would be at or below 60 dBA L_{dn}, which is the standard for exterior night time noise levels established by Sacramento County and the City of Sacramento, as stated in Section 4.14, "Noise," of the Phase 3 DEIS/DEIR. Based on this distance of 500 feet from construction equipment, in the worst case, residents in the vicinity of cutoff wall construction could be affected by round-the-clock construction for approximately one week as the cutoff wall is installed along the levee.

The 500-foot distance is modeled based on the assumption that sensitive receptors are located in the line-of-sight from the noise source. Additional reductions in noise levels would come from natural sound barriers, such as existing levees or other structures, including dwellings. For example, cutoff walls along the Sacramento River east levee would be constructed on the land side of the levee at an elevation below the crown of the levee. Therefore, the existing levee would provide some shielding to residents on the water side of the Garden Highway, reducing exterior noise levels at 500 feet by an additional 10–12 dB below the predicted level of 60 dBA L_{dn}. This

estimate is based on the assumption that cutoff wall construction equipment would generate noise at the level of 10 feet above ground surface, and the height of the existing levee is 25 feet above ground surface. Waterside residences would be out of the line-of-sight of this equipment.

Residences located adjacent to the NEMDC west levee, where cutoff wall construction would also be conducted as part of the Phase 3 Project, would not be shielded by the existing levee because construction would take place on top of the degraded levee. However, for residents not located immediately adjacent to the levee, intervening building façades and ground absorption would significantly reduce noise levels, and residents located at or beyond 500 feet from construction would likely experience noise levels below the exterior noise standard of 60 dBA L_{dn} due to these obstructions and the increasing distance from the noise source.

Subject: Draft Environmental Impact Statement (DEIS) for the Natomas Levee Improvement Program, Phase 3 Landside Improvements Project (CEQ# 20090040)

The U.S. Environmental Protection Agency (EPA) has reviewed the above-referenced document pursuant to the National Environmental Policy Act (NEPA), Council on Environmental Quality (CEQ) regulations (40 CFR Parts 1500-1508), and our NEPA review authority under Section 309 of the Clean Air Act.

EPA previously reviewed the DEIS and Final EIS (FEIS) for 408 Permission and 404 Permit to Sacramento Area Flood Control Agency (SAFCA) for the Phase 2 Landside Improvements Project and programmatic evaluation of the entire Natomas Levee Improvement Program (NLIP). We provided comments to the U.S. Army Corps of Engineers (Corps) on August 4, 2008 and December 11, 2008, expressing concerns because of our inability to determine whether or not the preferred alternative represents the Least Environmentally Damaging Practicable Alternative (LEDPA). We also expressed concern with the residual flood risk to development in a floodplain protected by levees, and the indirect and cumulative environmental effects of planned development facilitated by this levee project. F2-1

We continue to have concerns regarding the residual flood risk and the potential indirect and cumulative impacts of future development. We recommend implementation of the Natomas Basin flood safety plan (pps. 2-40 to 2-41) as soon as possible and prior to approval of additional development, so that new development does not compromise the flood-damage-and-risk-reduction achievements of this project. F2-2

While we commend efforts to avoid and fully compensate for the loss of riparian woodland, Giant garter snake habitat, wetlands, and Swainson's hawk habitat; we continue to have concerns with 371.48 acres of temporary effects and 36.75 acres of permanent effects on waters of the United States (US) for all four phases of the Natomas Levee Improvement Program (2008 – 2010) (p. ES-12, Phase 2 FEIS, November 2008). We recommend continued close consultation and collaboration with the U.S. Fish and F2-3

SAFCA '09 APR 9 PM2:04

Wildlife Service, California Department of Fish and Game, The Natomas Basin Conservancy, SAFCA, and Sacramento Area Council of Governments to ensure effects on woodlands, threatened and sensitive species habitat, and waters of the US are avoided and minimized.

F2-3 Cont'd

Phases 1 to 4 of the Natomas Landside Improvement Project constitute an "early implementation project" to improve Natomas Basin perimeter levees to meet the 100-year flood protection design criteria adopted by the Federal Emergency Management Agency. The remaining segments of the perimeter levee system would be improved by the Corps to provide flood protection that would meet California standards for the "200-year" flood stage surface water elevation. The Corps plans to seek Congressional authorization for this additional work based on a General Re-evaluation Report for the American River Common Features Project to be presented to Congress in 2010 (p. ES-3). As a reasonably foreseeable future action, the Corps' proposed "200-year" levee improvement project should be included in the evaluation of cumulative effects in the FEIS for the NLIP Phase 3 Landside Improvements Project.

F2-4

Based on the above concerns, we have rated this DEIS as Environmental Concerns – Insufficient Information (EC-2) (see enclosed "*Summary of Rating Definitions*"). We appreciate the opportunity to review this DEIS. When the FEIS is released for public review, please send one hard copy and a CD ROM to the address above (mail code: CED-2). If you have any questions, please contact me at (415) 972-3521, or contact Laura Fujii, the lead reviewer for this project. Laura can be reached at (415) 972-3852 or fujii.laura@epa.gov.

Jeff Drongesen, California Department of Fish and Game
John Bassett, Sacramento Area Flood Control Agency

U.S. Environmental Protection Agency Rating System for Draft Environmental Impact Statements Definitions and Follow-Up Action*

Environmental Impact of the Action

LO – Lack of Objections

The U.S. Environmental Protection Agency (EPA) review has not identified any potential environmental impacts requiring substantive changes to the proposal. The review may have disclosed opportunities for application of mitigation measures that could be accomplished with no more than minor changes to the proposal.

EC – Environmental Concerns

EPA review has identified environmental impacts that should be avoided in order to fully protect the environment. Corrective measures may require changes to the preferred alternative or application of mitigation measures that can reduce these impacts.

EO – Environmental Objections

EPA review has identified significant environmental impacts that should be avoided in order to provide adequate protection for the environment. Corrective measures may require substantial changes to the preferred alternative or consideration of some other project alternative (including the no-action alternative or a new alternative). EPA intends to work with the lead agency to reduce these impacts.

EU – Environmentally Unsatisfactory

EPA review has identified adverse environmental impacts that are of sufficient magnitude that they are unsatisfactory from the standpoint of public health or welfare or environmental quality. EPA intends to work with the lead agency to reduce these impacts. If the potential unsatisfactory impacts are not corrected at the final EIS stage, this proposal will be recommended for referral to the Council on Environmental Quality (CEQ).

Adequacy of the Impact Statement

Category 1 – Adequate

EPA believes the draft EIS adequately sets forth the environmental impact(s) of the preferred alternative and those of the alternatives reasonably available to the project or action. No further analysis of data collection is necessary, but the reviewer may suggest the addition of clarifying language or information.

Category 2 – Insufficient Information

The draft EIS does not contain sufficient information for EPA to fully assess environmental impacts that should be avoided in order to fully protect the environment, or the EPA reviewer has identified new reasonably available alternatives that are within the spectrum of alternatives analyzed in the draft EIS, which could reduce the environmental impacts of the action. The identified additional information, data, analyses or discussion should be included in the final EIS.

Category 3 – Inadequate

EPA does not believe that the draft EIS adequately assesses potentially significant environmental impacts of the action, or the EPA reviewer has identified new, reasonably available alternatives that are outside of the spectrum of alternatives analyzed in the draft EIS, which should be analyzed in order to reduce the potentially significant environmental impacts. EPA believes that the identified additional information, data, analyses, or discussions are of such a magnitude that they should have full public review at a draft stage. EPA does not believe that the draft EIS is adequate for the purposes of the National Environmental Policy Act and or Section 309 review, and thus should be formally revised and made available for public comment in a supplemental or revised draft EIS. On the basis of the potential significant impacts involved, this proposal could be a candidate for referral to the CEQ.

* From EPA Manual 1640 Policy and Procedures for the Review of Federal Actions Impacting the Environment. February, 1987.

F2-1 USACE and SAFCA received U.S. Environmental Protection Agency's (EPA's) referenced comment letters (dated August 4 and December 11, 2008) on the Phase 2 EIS. Responses were provided in the Phase 2 FEIS (USACE 2008) and Record of Decision (ROD) (USACE 2009), respectively, which are in the record and were considered by USACE and SAFCA in their decision-making on the Phase 2 Project; the content of the letters was also considered during preparation of this FEIR.

F2-2 Sacramento and Sutter County and the City of Sacramento have developed and are administering flood safety plans affecting the Natomas Basin within their respective jurisdictions. These plans will be updated as additional development in the Natomas Basin is approved.

Section 2.5.1, "Residual Risk of Flooding," in the Phase 3 DEIS/DEIR describes SAFCA's ongoing efforts to manage the residual risk of flooding in the Natomas Basin, which would remain even with achievement of a "200-year" level of flood risk reduction. As noted in Section 2.5.1, these efforts include providing the state with a safety plan (including a flood preparedness plan, levee patrol plan, flood-fight plan, and evacuation plan). Additionally, SAFCA has implemented a development impact fee program with the objective of avoiding any substantial increase in the expected damage due to an uncontrolled flood as new development proceeds in the floodplain. The revenue generated by the fee program will be used to implement flood risk reduction measures on an ongoing basis and to further reduce flood risk as new development occurs in the floodplain (see also Response to Comment L3-9).

F2-3 The Natomas Levee Improvement Program (NLIP) includes habitat conservation components as part of each project phase, as well as mitigation measures to avoid and minimize impacts to sensitive habitats and species. For example, Mitigation Measure 4.6-b, "Restore, Replace, or Rehabilitate Degraded SRA Habitat Function and Comply with Section 7 of the Federal Endangered Species Act, Section 1602 of the California Fish and Game Code, and Section 2081 of the California Endangered Species Act Permit Conditions," requires restoration, replacement or rehabilitation of degraded SRA habitat function and compliance with Section 7 of the Federal Endangered Species Act, Section 1602 of the California Fish and Game Code, and Section 2081 of the California Endangered Species Act Permit conditions; and Mitigation Measure 4.7-a, "Minimize Effects on Jurisdictional Waters of the United States, Complete Detailed Design of Habitat Creation Components and Secure Management Agreements to Ensure Compensation of Waters Filled, and Comply with Section 404, Section 401, Section 10, and Section 1602, Permit Processes," requires minimization of effects on jurisdictional Waters of the United States, completion of detailed design of habitat creation components and securing management agreements to ensure compensation of waters filled, and compliance with Section 404, Section 401, Section 10, and Section 1602, permit processes. SAFCA will continue to consult and collaborate closely with Federal, state, regional, and local agencies (including USACE, the U.S. Fish and Wildlife Service [USFWS], the California Department of Fish and Game [DFG], and The Natomas Basin Conservancy [TNBC]) on developing and implementing these measures. SAFCA is working closely with USACE on impacts to Waters of the United States for the NLIP through several NEPA documents covering Clean Water Act Section 404 approval, as well as several permit applications to fill Waters of the United States. SAFCA is also working closely with USFWS, the National Marine Fisheries Service (NMFS), DFG, and TNBC to ensure biological effects are avoided and/or minimized to the extent practicable.

Chapter 7.0, "Consultation and Coordination," of the Phase 3 DEIS/DEIR describes the consultation activities between USACE, SAFCA, USFWS, and DFG that have taken place in connection with the NLIP. Additionally, SAFCA has collaborated with TNBC on the planning, design, and long-term management of the NLIP's proposed habitat conservation components. This has involved multiple meetings and negotiations with the resource agencies and other Natomas Basin land managers such as Reclamation District (RD) 1000, and is ongoing. SAFCA has also coordinated with the Sacramento Area Council of Governments (SACOG), which endorsed SAFCA's White Paper in April 2006 (available on SAFCA's Web site at www.safca.org), to discuss the regional implications of providing improved flood damage reduction to the Natomas Basin. USACE and SAFCA will continue to work collaboratively with USFWS, DFG, TNBC, and SACOG.

F2-4 The Phase 1 Project, which was analyzed in the Local Funding EIR (SAFCA 2007a), has been constructed. The Phase 2, 3, and 4 Projects were fully analyzed in the Phase 2 EIR (SAFCA 2007b) and Phase 2 EIS (USACE 2008), and constitute the remainder of the NLIP Landside Improvements Project. This project-levee EIR is tiered from the above-mentioned documents and involves a portion of that bigger project. As described in Chapter 2.0, "Alternatives," in the Phase 3 DEIS/DEIR, where repairs are required in the Natomas Basin perimeter levee to address 100-year levee height deficiencies, SAFCA would repair the levee to meet the desired minimum of 3 feet of levee height above the "200-year" design water surface profile, thereby laying the groundwork for completion of "200-year" flood risk reduction over time. As part of the Phase 3 Project, the Sacramento River east levee improvements would be constructed with a levee crown at least 3 feet above the "200-year" design water surface profile. The existing height of the NEMDC west levee between Elkhorn Boulevard and Northgate Boulevard is anticipated to meet the "200-year" height requirement. Under SAFCA's approach, this would leave only a minor amount of work for USACE to complete the "200-year' improvements, primarily along the American River north levee and the NEMDC west levee between Elkhorn Boulevard and Sankey Road. These remaining repairs would make a minor contribution to the significant cumulative impacts that have been identified for the NLIP, as discussed in Chapter 5.0, "Cumulative and Growth-Inducing Impacts, and Other Statutory Requirements," in the Phase 3 DEIS/DEIR.

F2-5 Comment noted; a copy of the FEIR, and subsequently the FEIS to be prepared by USACE, will be provided to EPA as requested.

Subject: Comments on the Sacramento Area Flood Control Agency's February 2009, Draft Environmental Impact Report on the Natomas Levee Improvement Program Phase 3 Landside Improvement Project

Dear Mr. Bassett:

The California Department of Fish and Game (DFG) has reviewed the Sacramento Area Flood Control Agency's (SAFCA) February 2009, Draft Environmental Impact Report on the proposed Natomas Levee Improvement Program Phase 3 Landside Improvement Project (DEIR/EIS). As described in the DEIR/EIS, the project objectives include: 1) provide at least a 100-year level of flood protection to the Natomas Basin as quickly as possible, 2) provide "200-year" protection to the Natomas Basin over time, and 3) avoid any substantial increase in expected annual damages as new development occurs in the Basin.

S5-1

The DFG is providing comments on the DEIR/EIS as a trustee agency and a responsible agency. As trustee for the State's fish and wildlife resources, the DFG has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and the habitat necessary for biologically sustainable populations of such species. In this capacity the DFG administers the California Endangered Species Act (CESA), the Native Plant Protection Act (NPPA), and other provisions of the California Fish and Game Code that afford protection to the State's fish and wildlife public trust resources. As a responsible agency the DFG will review a Lake and Stream Alteration Agreement notification package for components of the proposed project.

Enforceable Mitigation Measures

CEQA Guidelines §§15126.4 (a)(1)(B) states that formulation of mitigation measures should not be deferred until some future time. Table ES-2 lists a number of mitigation measures for fisheries and aquatic resources (i.e. mitigation measures 4.6a and 4.7a), terrestrial biological resources (i.e. mitigation measures 4.8a, 4.8b, 4.9a, 4.9c, and 4.9f) that rely on future approvals or agreements with the Wildlife Agencies. These entities are entrusted with carrying out the Natomas Basin Habitat Conservation Program's (NBHCP's) permit conditions, Natomas Basin Conservancy (NBC), and agencies entrusted with providing public safety (Federal Aviation Administration (FAA) approval over mitigation on proposed borrow site / Sacramento Airport buffer lands), as a means

S5-2

Conserving California's Wildlife Since 1870

to bring identified significant environmental effects to below a level that is significant. As there is no guarantee that these approvals or cooperation with all of the above entities will ultimately occur, the DFG believes the above mitigation measures are potentially unenforceable and may not bring the impacts to fisheries and aquatic resources to below a level that is significant.

S5-2 Cont'd

Mitigation measures should establish performance standards to evaluate the success of the proposed mitigation, provide a range of options to achieve the performance standards, and must commit the lead agency to successful completion of the mitigation. Mitigation measures should also describe when the mitigation measure will be implemented and explain why the measure is feasible. The DFG recommends the mitigation measures summarized in Table ES-2, include measures that are enforceable and do not defer mitigation details to some future time. The DEIR/EIS should identify the following items: how each measure will be carried out; who will perform the measures; when the measures will be performed; the performance standards and mechanisms for achieving success; and an assured source of funding to acquire and manage identified mitigation lands. The DEIR/EIS could describe a range of enforceable mitigation measures that will be implemented in instances where approval and cooperation with the entities identified above either does or does not occur.

S5-3

CESA

As we have done for previous phases of this project, the Department anticipates issuing an Incidental Take Permit (ITP) for this phase under the provisions of the California Endangered Species Act. Issuance of an ITP is subject to CEQA documentation. Because of this, it is critical that the CEQA analysis and the identification of specific mitigation measures be as thorough as possible in the EIR in order for us to be able to rely on the existing environmental document when making our CEQA findings for the ITP. The DFG may only issue a CESA permit if it is determined that impacts associated with the authorized take of the species are minimized, fully mitigated, and that adequate funding has been ensured to implement the mitigation measures. The DFG may only issue a CESA permit if it determines that issuance of the permit will not jeopardize the continued existence of the species. This determination will be made based on the best scientific information available and shall include consideration of the species capability to survive and reproduce, including the species known population trends and known threats to the species. Issuance of a CESA permit may take up to 180 days from receipt of an application for take authorization.

S5-4

Potential Impacts to Special-Status Plant Species

The DEIR/EIS states that three special-status plant species have the potential to occur within the project area, including Rose Mallow (*Hibiscus lasiocarpus*), Delta Tule Pea (*Lathyrus jepsonii* var. *jepsonii*), and Sanford's Arrowhead (*Sagittaria sanfordii*). The DEIR/EIS states: "no surveys have been conducted to confirm that the species in question are present in these habitats; however, surveys for special-status plants within the Phase 3 Project area will be conducted during the appropriate time for identification in 2009, before project construction". The DFG recommends focused rare-plant surveys be conducted at the appropriate time of year to identify any special-status plants which may be present within the project area. The results of these floristic

S5-5

surveys need to be evaluated in the final EIR/EIS along with appropriate minimization and mitigation measures. Compliance with CEQA is predicated on a complete and accurate description of the existing site conditions that will be altered if the proposed project is approved. Without a complete and accurate description of the existing plant flora in and around the project site the DEIR/EIS likely provides an incomplete analysis of project-related environmental impacts. S5-5 Cont'd

Mitigation measure 4.9a of the DEIR/EIS states: "if special-status plants are present in areas that cannot be avoided... affected plants may potentially be transplanted to the GGS/Drainage Canal, if feasible". The DFG has found transplantation of herbaceous plants is typically unsuccessful and should be considered experimental. Mitigation measures for any potentially unavoidable impacts to special-status plants should include additional measures to increase the chances of survival for the population in question. If special-status plants cannot be avoided during project activities, seed should be collected and propagated at a DFG approved nursery facility in order to provide additional plantings at an approved mitigation site. Additionally, a mitigation plan approved by the DFG should be developed, which includes a planting plan, monitoring plan, success criteria, and a remediation plan in the event that success criteria are not met. These mitigation sites should be permanently protected and managed in perpetuity. S5-6

Impacts to Swainson's Hawk and Other Raptor Species

The DFG is concerned with potential impacts to raptor nesting behavior not currently addressed in the DEIR/DEIS. Page 2-25 of the DEIR/DEIS describes construction activities including the 24/7 construction of cutoff walls before the start of flood season (November 1), as well as an estimated 900-1,000 haul trips per day to deliver fill material to construct reaches 5A-9B of the Sacramento River east levee. The DFG believes that each of these activities could potentially result in significant impacts to nesting raptors including nest abandonment, starvation of young, and/or reduced health and vigor of eggs or nestlings that could result in death.

The final EIR/EIS should identify the potential impacts to nesting raptors associated with 24-hour construction schedules along riparian zones such as the Sacramento River, which contains a higher density of nesting raptors than elsewhere in the Natomas Basin. In its current form the DEIR/DEIS does not explore the potential impacts of nighttime construction activities on nesting raptors such as: high-intensity lighting, operation of heavy equipment or the presence of construction personnel at all hours of the night. Furthermore, construction at night poses additional complications for the effectiveness of biological monitors in ensuring that appropriate buffer zones are in place around active nests and that birds do not abandon their nest. The final EIR/EIS should include feasible mitigation measures that reduce these impacts to below a level of significance. S5-7

Mitigation measure 4.9f states: "surveys for nesting birds shall be conducted before project activities are initiated during the nesting season (March 1-July 31)". The DFG recommends that nesting bird surveys be conducted until September 15th, in accord with current DFG survey protocols for nesting birds. Additionally, mitigation measure 4.9f states: "the biologist shall conduct preconstruction surveys to identify active nests S5-8

within 0.25-mile of construction areas, in accordance with DFG guidelines". Current DFG guidelines require preconstruction surveys be conducted within 0.5-miles of construction areas, with a 0.25-mile construction buffer zone placed around any active nest that is identified. S5-8 Cont'd

Northern Harrier

The Northern Harrier (*Circus cyaneus)* (NOHA) is listed in California as a Species of Special Concern, and is protected from take by Fish and Game section 3503.5. The DEIR/EIS does not provide a discussion of potential impacts to these ground nesting raptors associated with construction and borrow site activities and does not consider avoidance or mitigation measures to avoid "take" or lessen potential impacts to below a level that is significant. The DFG recommends that the DEIR/EIS provide a discussion of the project's potential to impact NOHA, and include measures to avoid take of these birds, and their nests and eggs. S5-9

We appreciate your consideration of our comments. DFG personnel are available for consultation regarding biological resources and strategies to minimize impacts. If you have questions please contact Patrick Moeszinger, Environmental Scientist, at 916-358-2850 or Jeff Drongesen, Senior Environmental Scientist, at 916-358-2919.

Sincerely,

Kent Smith
Habitat Conservation Program Manager

[1] Although Phase 1 Project permitting requirements were fulfilled, they are not included in this table because construction is complete.

[2] The Phase 3 Project permits have been separated into 3 subphases (a, b, and c); status listed in table refers to the Phase 3a permit.

Source: Data compiled by EDAW in 2009

It is common to receive permits from these agencies, in their capacities as responsible agencies, after an FEIR is certified. The BOs and incidental take permit, which will contain specific conditions to protect species at a higher performance standard than exists under CEQA ("take" versus no substantial effect), specify that implementation is the responsibility of SAFCA, and establish measurable parameters (performance standards) and actions that SAFCA will be required to implement if the parameters are not met. USFWS, NMFS, and DFG permits include specific and stringent performance standards. These agency documents are not studies, but permits with legally binding and enforceable terms and conditions. If SAFCA does not receive permits from these agencies, SAFCA simply cannot implement the Proposed Action. Permit terms in USFWS, NMFS, and DFG permits are enforceable and must be complied with by SAFCA. The established mitigation in the Phase 3 DEIS/DEIR does not constitute impermissible "deferred mitigation" and meets CEQA requirements for effective and legally adequate mitigation. The following discussion provides additional supportive information.

Impacts to wildlife habitat from project construction would be compensated for through a Natomas Basinwide habitat creation, enhancement, and preservation component as part of the NLIP (See Section 2.3.3, "Habitat Conservation Components," in the Phase 3 DEIS/DEIR). These components include creation and/or preservation of managed grasslands, aquatic habitat, uplands, woodlands, field crops, and rice that function as wildlife habitat. This conservation strategy is designed to offset impacts to habitat and to contribute towards long-term viability of the giant garter snake, valley elderberry longhorn beetle, Swainson's hawk, and other nesting raptors and songbirds. Therefore, these conservation components are not "mitigation measures;" rather, they are part of the Proposed Action. Nevertheless, these aspects of the Phase 3 Project will still meet the same requirements of enforceability and approval by permitting agencies as they would if they were mitigation measures. The conservation strategy was designed to meet all the requirements of mitigation specified in the State CEQA Guidelines.

As stated in State CEQA Guidelines (Section 15126.4[a][1][B]), "formulation of mitigation measures should not be deferred until some future time. However, measures may specify performance standards which would mitigate the significant effect of the project and which may be accomplished in more than one specified way." Hence, mitigation measures commonly are adopted in which the agency commits to achieving a performance standard and the mitigation measure lists options and alternatives for achieving the performance standard, some or all of which may be selected for implementation as part of a future, specific mitigation or management plan.

S5-3 Section 2.3.3, "Habitat Conservation Components," in the Phase 3 DEIS/DEIR includes performance criteria for assessing the success of conservation components along with how and when assessment monitoring would be carried out for aquatic habitat, rice and field crops, managed grasslands, and woodlands.

Further description of these conservation components and how they are expected to function can be found in Sections 4.8, "Vegetation and Wildlife," and 4.9, "Special-Status Terrestrial Species," in the Phase 3 DEIS/DEIR under the Proposed Action. Construction details for the proposed GGS/Drainage Canal can be found in Appendix H of the Phase 3 DEIS/DEIR along with dates for completion.

See also Section 2.3.3.6, "Long-Term Management of Habitat Components," in the Phase 3 DEIS/DEIR for a description of land protection and management mechanisms for long-term management of conservation components. Construction of conservation components and assessment monitoring will be carried out by SAFCA or its contractors.

The Draft NLIP Landside Improvements Project Programmatic Long-Term Management Plan (LTMP) and the NLIP Phase 3 Mitigation and Monitoring Plan (MMP) provide further details for ensuring that habitat improvement and compensation sites are managed, monitored, and maintained in perpetuity. The completion of these documents is expected by June 2009. Funding agreements for proposed parties responsible for management are detailed in the LTMP and MMP. Before project construction that could affect agency-regulated habitat can begin, permits must be issued by the applicable resource/regulatory agencies, and the LTMP and MMP documents are subject to their approval. Management responsibilities and protection obligations under these plans will be held by USFWS, DFG, SAFCA, TNBC, Sacramento County, Sacramento County Airport System (SCAS), the Natomas Central Mutual Water Company (NCMWC), and RD 1000.

S5-4 SAFCA acknowledges the Proposed Action could result in take of giant garter snake and Swainson's hawk, and that a California Endangered Species Act (CESA) 2081 Permit is required for these species. SAFCA will fully comply with the CESA permitting process, including

necessary compensation/mitigation for impacts to state-listed species, funding for said compensation/mitigation, and the amount of time potentially required for issuing a permit.

S5-5 Mitigation Measure 4.9-a, "Conduct Focused Surveys for Special-Status Plants, Minimize Effects, and Develop Detailed Design of Created Habitat and Management Agreements to Ensure Compensation for Loss of Habitat, and Implement all Management Agreements," in the Phase 3 DEIS/DEIR includes conducting plant surveys at the appropriate time of year to identify any special-status species in the area, ensures no net loss of special-status species if they are found, and includes consultation with appropriate regulatory agencies including DFG. These surveys are planned for the appropriate blooming season in June/July 2009, which is after the FEIR is completed. DFG will be notified of all results of the special-status plant surveys when the surveys are conducted.

Preconstruction surveys must take place immediately prior to construction activities. When preconstruction surveys are coupled with specific actions to be taken if the species are found, and there are specific performance standards established, then the mitigation is adequate under CEQA.

S5-6 SAFCA understands that transplanting herbaceous plants can be unsuccessful. If surveys indicate that special-status plants would be lost as a result of project implementation, Mitigation Measure 4.9-a, "Conduct Focused Surveys for Special-Status Plants, Minimize Effects, and Develop Detailed Design of Created Habitat and Management Agreements to Ensure Compensation for Loss of Habitat, and Implement all Management Agreements," is revised to include the following: SAFCA commits to implement additional measures to increase the chance of success for establishment of special-status plant populations in created habitats, such as seed collection and propagation at a DFG-approved nursery to provide additional plantings and conducting transplantation during the dormant season, if feasible, to an approved site. SAFCA will develop a mitigation plan to be approved by DFG, and mitigation lands will be protected and managed in perpetuity, as recommended. See Chapter 4.0, "Revisions to the DEIS/DEIR," of this FEIR for the text revision.

S5-7 Mitigation Measure 4.9-f, "Minimize Potential Impacts on Swainson's Hawk and Other Special-Status Birds Foraging and Nesting Habitat, Monitor Active Nests during Construction, Develop and Implement a Management Plan in Consultation with DFG, Obtain Incidental Take Authorization, and Implement Mitigation Measure 4.8-a, [Minimize Effects on Woodland Habitat, Complete Detailed Design of Woodland Creation and Management Agreements to Ensure Compensation for Loss of Quantity and Quality of Habitat, Implement all Agreements, and Comply with the DFG Section 1602 Permit Process]," in the Phase 3 DEIS/DEIR is intended to (1) be encompassing enough to mitigate any and all construction activities, day or night, (2) provide for monitoring to identify any unanticipated nest disturbance, and (3) provide flexibility to determine an appropriate course of action in consultation with DFG if unanticipated effects occur. This measure addresses any impacts that may occur from 24/7 construction and haul trips.

S5-8 Mitigation Measure 4.9-f, "Minimize Potential Impacts on Swainson's Hawk and Other Special-Status Birds Foraging and Nesting Habitat, Monitor Active Nests during Construction, Develop and Implement a Management Plan in Consultation with DFG, Obtain Incidental Take Authorization, and Implement Mitigation Measure 4.8-a, [Minimize Effects on Woodland Habitat, Complete Detailed Design of Woodland Creation and Management Agreements to Ensure Compensation for Loss of Quantity and Quality of Habitat, Implement all Agreements, and Comply with the DFG Section 1602 Permit Process]," in the Phase 3 DEIS/DEIR has been revised to reflect these updates to DFG protocol for nesting raptors. See Chapter 4.0, "Revisions to the DEIS/DEIR," of this FEIR for the text revision.

S5-9 The northern harrier is discussed as a special-status species in Section 3.3.9.2, "Special-Status Wildlife Species," and in Table 3.9-2 in the Phase 3 DEIS/DEIR. Impacts 4.7-a, "Impacts on Jurisdictional Waters of the United States," and 4.9-f, "Impacts on Swainson's Hawk and Other Special-Status Birds," in the Phase 3 DEIS/DEIR describe and evaluate the Phase 3 Project's potential impacts to potential nesting habitat for Swainson's hawk and other special-status birds, including grasslands, croplands, and marsh. To provide additional clarification, northern harrier will be specifically identified in Impact 4.9-f as a special-status bird. See Chapter 4.0, "Revisions to the DEIS/DEIR," of this FEIR for the text revision.

Mitigation Measure 4.9-f, "Minimize Potential Impacts on Swainson's Hawk and Other Special-Status Birds Foraging and Nesting Habitat, Monitor Active Nests during Construction, Develop and Implement a Management Plan in Consultation with DFG, Obtain Incidental Take Authorization, and Implement Mitigation Measure 4.8-a, [Minimize Effects on Woodland Habitat, Complete Detailed Design of Woodland Creation and Management Agreements to Ensure Compensation for Loss of Quantity and Quality of Habitat, Implement all Agreements, and Comply with the DFG Section 1602 Permit Process]," provides measures that cover surveys and avoidance for all nesting special-status birds, including the northern harrier. Focused transect surveys will be used to survey for northern harrier nests. If an occupied nest is found, this measure requires developing an appropriate buffer that minimizes potential disturbance of the nest to be determined by the biologist and in coordination with DFG.
