APPENDIX A

TABLE 2.4 SUMMARY OF ENVIRONMENTAL COMMITMENTS

Table 2-4. Summary of Environmental Commitments (Mitigation Measures, etc.) for the Proposed Project (Alternative 2). These are incorporated from the 2007 EIS/EIR (Table 2-2, page 2-37) and the 2017 SEIS/EIR (Table ES-2, page E-17) with revisions to include updated regulations and information therefore, these Mitigation Measures supersede previous versions.

ID #	DESCRIPTION
	RECREATION
R-1	Public outreach would be conducted through mailings, posting conspicuous signs, coordination with interested groups, and meetings, if necessary, in order to provide information regarding changes to recreational access in and around Folsom Lake. The detours, traffic control measures, access restrictions, increased signage, increased education, and public outreach would help mitigate effects to recreational users of the FLSRA.
R-2	The construction contractor would be required to: (1) Utilize traffic control measures, security fencing and/or temporary alternate public access detours for pedestrian, equestrian, bicycle and vehicular traffic; (2) Post warning and restricted access signs before and during construction as necessary.
R-3	Prior to concrete floodwall construction at Dikes 4, 5, and 6, a temporary detour trail would be established to help mitigate the temporary loss of the existing trail/roadway that runs along the crest of the dikes. This detour trail would largely make use of an existing trail that would be repaired/modified, as necessary, prior to its usage as the detour route.
R-4	A temporary detour road would be built to serve as the entry to the Granite Bay Main Beach parking lot prior to closing the existing entry road for project construction purposes. In addition, a temporary detour road to the Granite Bay Activity Center would be built prior to closing a segment of the existing access road for project construction purposes. These temporary roads would be removed once they are no longer needed.
R-5	The raising of the access road to the Granite Bay Horse Assembly Area would be prioritized for rapid completion to minimize the time this access road must be closed for project construction.
R-6	Prior to the construction of the Dike 5 access, a temporary detour trail would be established west of the currently existing trail.
R-7	To help prevent large rocks or similar objects from possibly rolling into the Beal's Point RV Campground during the raising of Dike 6, concrete Jersey barriers (K-rails) would be installed adjacent to the east side of this campground. These barriers would be removed once the dike raise has been completed.
R-8	The existing public entrance from Douglas Blvd. to the Granite Bay recreation area would be used as the primary entrance and exit for Dikes 1-3 construction. However, haul trucks and other large construction equipment would be limited to using the Douglas Blvd. entrance to times of the year and times of day when recreational usage is at a minimum. Project construction traffic would not use the main public entrance to the Beal's Point recreation area except for special circumstances (ex. emergency access, hauling equipment that cannot access the project sites by the main construction access roads, etc.). Any use of the main public entrances cited would be coordinated with State Parks Folsom Sector Superintendent.

ID #	DESCRIPTION
R-9	Existing FLSRA recreation facilities that are adversely altered or damaged because of project construction work would be returned to their pre-construction condition near the end of construction.
R-10	Paved roads and parking areas damaged during project construction would be appropriately repaired by the construction contractor; however, such repairs would be limited to damages that can be documented as being a direct result of project construction activities rather than damages caused by other sources.
R-11	For water pumped from Folsom Lake for construction, the contractor would provide buoys to prevent the public from being within 20 feet of the pump intakes and would secure pumps using minimum 6-foot-high chain-link fencing.
	VEGETATION AND WILDLIFE
VW-1	To minimize dust impacts to vegetation, wetlands, and wildlife, dust control measures consistent with SMAQMD fugitive dust control measures would be implemented by the construction contractor.
VW-2	The construction contractor would be required to clean vehicles and equipment before first entering the project site.
VW-3	For each phase of the project, the USACE would prepare final construction plans that would include drawings identifying habitat areas, including wetlands, that must be protected and specifying the methods of protection (e.g. installation of fencing or similar physical barriers, posting of signs, etc.). These plans would also illustrate and/or describe those areas/lands near the project features that are outside the limits of construction (and thus are protected from direct construction impacts). The final construction plans would be accompanied by written project specifications further detailing the habitat protection requirements, as well as general requirements concerning the protection of vegetation and wildlife.
VW-4	Native trees and shrubs having a DBH of 2 inches or greater located within the limits of construction of a particular project phase would be preserved to the extent practicable. The construction contractor would establish protective buffers (e.g. temporary fencing) around the driplines of those trees and shrubs to be preserved that are located within the limits of construction. Native trees and shrubs located outside the limits of construction would be preserved. The construction contractor would also erect protective buffers along the limits of construction where these limits are near the adjacent trees and shrubs to be preserved. Any required trimming of native trees or shrubs would be conducted by, or under the direct supervision of a certified arborist.

ID #	DESCRIPTION
VW-5	The USACE has determined that approximately 12.3 acres of oak woodland habitat would be eliminated as a result of construction activities. Consequently, the USACE has developed a mitigation plan to compensate for these losses. Compensatory mitigation would involve creation or restoration of the affected habitat types. The minimum ratio of the acres of each type to be restored or created per acre of each type lost would be 1.2:1. The mitigation ratio for oak plantings at MIAD West would be 1:1. The mitigation goal would be to create or restore habitat where the density of canopy tree species and midstory woody species is approximately the same as the average density of canopy tree species and midstory woody species found in the impacted habitats. The ground cover stratum would be restored through the planting of various native grasses and forbs, while the species composition of the midstory and canopy strata would strive to mimic that of the affected habitats. The restored areas would be managed and monitored by the USACE (or the USACE contractor) for 5 years, although this period could be reduced to 4 years if success criteria are achieved by that time. The mitigation site(s) and overall mitigation plan would be selected in coordination with USFWS, DWR, SAFCA, Reclamation, and State Parks.
VW-6	Project impacts to migratory birds, including bald eagles, Swainson's hawks, white-tailed kites, and Peregrine Falcons would be avoided or minimized to the degree practicable by following the avoidance, minimization, and mitigation measures set forth in Section 3.3.3 for such species.
VW-7	The USACE would ensure that all construction personnel undergo environmental protection training to be aware of all required environmental protections (bird, wildlife, and vegetation/habitat protection) per the final construction plans and specifications, as well as those required by applicable federal and state laws.
VW-8	The construction contractor would be required to place food related wastes in self-closing trash containers.
VW-9	After completing construction activities within a given project phase, disturbed portions of the staging areas used for the project phase would be restored by the construction contractor. One exception to this generalization would be in cases where a particular staging area is also going to be used for a subsequent project phase. In such cases, the shared staging area would not be restored until the final project phase to use the staging area is completed. Another exception would be for staging areas, or portions thereof, that encompass permanent man-made features. Such areas would not be restored. Restoration of staging areas would first involve restoring pre-construction topography to the degree practicable. Next, a mixture of native grass and forb seeds would be planted throughout disturbed portions of staging areas in order to establish a permanent vegetative groundcover. The planted areas would be periodically monitored until the average ground cover accounted for by native grasses and forbs reaches approximately 75 percent.
VW-10	Revegetated areas would be monitored for invasive plant species by USACE staff during the construction contract warranty period of a given project phase. The term invasive plant species refers to those plants listed in the California Invasive Plant Inventory database generated by the California Invasive Plant Council and having an invasive rating of "high" or "moderate". If it is determined invasive plants are becoming established, such plants would be eradicated by the construction contractor through directed herbicide applications, physical removal, or both. The goal would be to control invasive plant species such that they account for 5 percent or less of the average total plant cover.

ID #	DESCRIPTION
VW-11	Prior to initiating construction of a given project phase, USACE staff would conduct an assessment of drainage depressions, channels, and ditches present at the project site to determine whether any such features provide water to wetlands. USACE staff would also delineate the approximate limits of jurisdictional wetlands located within or immediately adjacent to the project's limits of construction. The construction contractor would be required to maintain flows in those drainage features that are found to provide water to wetlands.
VW-12	Once the Park Road detour road segment (an element of the project phase that includes Dikes 1, 2, and 3) is no longer needed for the proposed project, this road segment would be removed. Topography altered by construction of the road would be restored to approximately match pre-construction topography and natural areas disturbed by road construction would be planted with native grasses and forbs.
VW-13	The contractor would minimize or avoid the effects of nighttime lighting on wildlife species by implementing the following actions: 1) Avoiding construction activities at night, to the maximum extent practicable. 2) Using the minimal amount of lighting necessary to safely and effectively illuminate the work areas. 3) Shielding and focusing lights on work areas and away from the water surface of Folsom Lake and the American River, to the maximum extent practicable. 4) Temporary and permanent lighting will have correlated color temperatures and under 3000K to minimize disturbance to wildlife at night. 5) A qualified biologist will monitor the work area at appropriate intervals to assure that all avoidance and minimization measures are implemented.
	SPECIAL STATUS SPECIES (LISTED SPECIES)
LS-1	As project design plans are developed and refined, USACE, to the degree practicable, would adjust the limits of construction to avoid removal of existing native trees and large shrubs (with a DBH of 1 inches or greater) and elderberry shrubs (having one or more stems measuring 1 inch or greater in diameter at ground level).
LS-2	Prior to starting construction activities for a given phase of the project, a qualified biologist would survey areas within 1,000 feet of the areas slated for construction in the given phase to determine whether any bald eagle nests are present. If any nests are discovered and regardless of whether a nest is classified as active, inactive/alternate, or abandoned, the USACE would coordinate with USFWS staff and CDFW staff to determine measures necessary to avoid, minimize, or mitigate potential adverse construction impacts to bald eagles and then would implement appropriate measures. Such measures could include not conducting project construction work within 660 feet of an active bald eagle nest or monitoring behavior of eagles tending an active or alternate nest for signs of stress and potential nest abandonment during the nesting season.

ID #	DESCRIPTION
LS-3	Prior to beginning construction for the Proposed Project, USACE biologists would survey within 1,000 feet of the areas slated for construction in the given phase for Loggerhead Shrike, White-tailed kite, and Peregrine Falcon to determine if these species are present. If any active nests (typically March 1 through August 31) are discovered during the field surveys the USACE would coordinate with CDFW staff to determine measures necessary to avoid, minimize, or mitigate potential adverse construction impacts. A qualified biologist would also survey areas within a 0.5-mile radius (2,640-foot radius) of construction areas to determine if Swainson's hawk nests are present. Swainson's hawk surveys would be completed in compliance with the CDFW survey guidance. Other migratory bird nest surveys can be conducted concurrent with the Swainson's hawk surveys, with at least one survey conducted no more than 48 hours from the initiation of project construction activities to confirm the absence of nesting. If these surveys find there are active Swainson's hawk nests present within the defined areas, CDFW would be contacted to determine the proper course of action. If necessary, buffers would be established around active nests with no construction allowed within the buffer zones until fledglings have left the nests. An alternative approach might involve monitoring active nests in close proximity to project construction areas for signs of stress exhibited by the adult birds, which could lead to nest abandonment.
LS-4	Prior to initiating construction activities for a particular phase of the overall project, a qualified biologist would conduct surveys for migratory bird nests situated within the limits of construction as well as such nests located within approximately 250 feet of these limits. If the initial surveys do not take place during the migratory bird nesting season (typically March 1 through August 31), then a qualified biologist would again conduct surveys for migratory bird nests at the beginning of the nesting season in a similar manner. If inactive nests are found (e.g. nests that do not contain eggs or chicks), these would be removed to help prevent birds from re-using the nests. Such inactive nests would not be removed if they belong to a special status species (listed species). If active nests are found, the following would be followed: (1) If active migratory bird nests are discovered within the project limits of constructions, buffer areas would typically be established by the construction contractor around each nest and construction activities within the buffer(s) would be prohibited until the young occupying the nests have fledged. The qualified biologist would then coordinate with USFWS staff and CDFW staff to determine the appropriate size of such nest buffer zones. Similarly if active migratory bird nests are documented within approximately 250 feet of the project's limits of construction, buffer areas would also be established around these nests as well; (2) If it is not practicable for project construction activities to avoid direct impacts to active migratory bird nest, the USACE would obtain a Special Purpose Permit (Migratory Bird Permit) from USFWS prior to impacting the active nests. This permit would authorize live-trapping and relocation of the affected active nests and the eggs or chicks occupying the nests. Chicks and/or viable eggs collected by qualified USACE staff pursuant to the permit would be taken to a wildlife care/rehabilitation facility.
LS-5	The construction contractor would be required to report any active or inactive migratory bird nests to the USACE within 24 hours of discovery of such nests.

ID #	DESCRIPTION
LS-6	Prior to construction of a particular project phase, USACE environmental staff would perform field surveys to locate elderberry shrubs having one or more stems measuring 1.0 inch or greater in diameter at ground level that are within or in close proximity to the project phase's limits of construction.
LS-7	Construction personnel would receive USFWS-approved worker environmental awareness training to ensure that workers recognize elderberry shrubs and the valley elderberry longhorn beetle (VELB). The training would include: the protected status of VELBs and their host plants, elderberry shrubs; the need to avoid adversely affecting elderberry shrubs; elderberry shrub avoidance areas (protective buffers/exclusion zones); measures to be taken by workers during construction to protect elderberry shrubs; possible penalties that could be imposed for not complying with requirements established for the protection of elderberry shrubs and the VELB.
LS-8	Where practicable, a minimum setback (buffer) of 100 feet from the drip-line of all elderberry shrubs containing stems measuring 1.0 inch or greater in diameter at ground level would be established. There may be instances where a 100-foot buffer is not practicable due to various constraints. In such cases, a buffer of at least 20 feet from the dripline of such elderberry shrubs would be established if feasible. The USACE will consult with USFWS prior to establishing any elderberry shrub buffer zones (setbacks) that extend less than 100 feet from the drip-line of a particular shrub. Prior to project construction activities near elderberry shrubs to be preserved, temporary protective barriers would be installed along the limits (boundaries) of approved elderberry shrub buffer zones (exclusion areas). No construction activities or similar disturbances would be allowed within the elderberry shrub buffer zones unless authorized in advance by the USACE and USFWS. In situations where elderberry shrubs to be preserved are located more than 100 feet from the project's limits of construction, protective barriers may not be installed if existing landscape conditions are such that inadvertent damage to the shrubs during construction is unlikely. The contractor would install signs approximately every 50 feet along the edge of any protective structural barriers. The signs would include the text: "This area is the habitat of the valley elderberry longhorn beetle, a threatened species, and must not be disturbed. This species is protected by the Endangered Species Act of 1973, as amended. Violators are subject to prosecution, fines, and imprisonment." The signs would be readable from a distance of 20 feet and would be maintained during project construction.
LS-9	Any damage done within elderberry shrub buffer zones during the course of project construction would be remediated by the construction contractor shortly following the discovery of such damage. Remediation work may include installing erosion control measures, seeding disturbed areas with appropriate native plant seeds, etc.
LS-10	No insecticides, herbicides, fertilizers, or other chemicals that might harm the VELB or its host plant would be used in elderberry shrub buffer zones, or within 100 feet of any elderberry shrub with one or more stems measuring 1.0 inch or greater in diameter at ground level.
LS-11	If mowing of vegetation is deemed necessary to reduce fire hazard, such mowing may be performed within elderberry shrub buffer zones but only during the period from August through February. No mowing would be allowed within 5 feet of elderberry shrub stems, and all mowing would be done in a manner that avoids damaging elderberry plants.

ID #	DESCRIPTION
LS-12	If direct construction impacts to elderberry shrubs (limited to those having at least 1 stem with a diameter of at least 1 inch as measured at ground level) are unavoidable, the USACE would purchase an appropriate number of credits from a USFWS-approved conservation bank as compensatory mitigation for such impacts. The number of conservation credits required would be based on methodologies prescribed in the USFWS's 1999 conservation guidelines for VELB (the "VELB Guidelines") and direct coordination with USFWS staff. The USACE would also contract with the same conservation bank from which the conservation credits are purchased to transplant the affected elderberry shrub(s) from the project site to the conservation bank. The affected shrubs would be transplanted when the plants are dormant (roughly November through the first 2 weeks in February) if feasible. The contractor (the conservation bank) would be required to follow the transplanting procedure set forth in the VELB Guidelines and USACE staff would monitor the removal of the shrubs from the project site.
LS-13	The process for evaluating the potential impacts to the VELB in a given project phase would be as follows: (1) Designate elderberry shrubs that would be preserved and the protective buffers associated with each of those shrubs; (2) Designate shrubs that would have to be removed/transplanted, and determine the number of conservation credits that would have to be purchased to compensate for those shrubs that must be transplanted; (3) Submit a request for reinitiation of Endangered Species Act Section 7 consultation to USFWS that contains seeks concurrence with the USACE effects determination and the USACE proposed avoidance, minimization, and compensatory mitigation measures, (4) Proceed with construction of a given phase following receipt of the USFWS's Biological Opinion (e.g. amendment to Service File 08ESMF00-2017-F-0043).
LS-14	During project construction and/or restoration activities that involve earthwork, measures would be employed to suppress generation of dust. Such measures would include frequent watering of project haul roads, earthen stockpile areas, and similar exposed soil surfaces.

ID #	DESCRIPTION
LS-15	Wherever feasible, construction activities would occur outside of the pupping season for bats (generally April 1 to August 31). If removal of trees must occur during the bat pupping season, within 30 days of tree removal activities, all trees to be removed will be surveyed by a qualified biologist for the presence of features that may function as special status bat maternity roosting habitat. Trees that do not contain potential special status maternity roosting habitat may be removed. For trees that contain suitable special status bat maternity roosting habitat, surveys for active maternity roosts shall be conducted by a qualified biologist in trees designated for removal. The surveys shall be conducted from dusk until dark. If a special-status bat maternity roost is located, appropriate buffers around the roost sites shall be determined by a qualified biologist and implemented to avoid destruction or abandonment of the roost resulting from tree removal or other project activities. The size of the buffer shall depend on the species, roost location, and specific construction activities to be performed in the vicinity. No project activity shall commence within the buffer areas until the end of the pupping season (September 1) or until a qualified biologist confirms the maternity roost is no longer active. If construction activities must occur within the buffer, a qualified biologist would monitor activities either continuously or periodically during the work, as determined by the qualified biologist. The qualified biologist would be empowered to stop activities that, in the biologist's opinion, threaten to cause unanticipated adverse effects on specials status bats. If construction activities are stopped, CDFW would be consulted to determine appropriate measures to implement to avoid adverse effects. For trees containing cavities, cracks, crevices, or deep bark fissures that are planned for removal or trimming (irrespective of time of year), such trees must be trimmed and/or removed in a two-phase removal system conducted over two consecutive days. The first day (in the afternoon), limbs and branches would be removed, using chainsaws only. Removal activities must avoid limbs with cavities, cracks, crevices, or deep bark fissures, and remove only branches and limbs without those features. On the second day, the entire tree would be removed. A qualified biologist would monitor removal of these trees.
	AIR QUALITY

ID #	DESCRIPTION
AQ-1	The project construction contractor would be required to adhere to these requirements when a given project phase would involve the disturbance of lands that may harbor NOA. Submit an Asbestos Dust Mitigation Plan that conforms to requirements set forth in the State of California's Asbestos Airborne Toxic Control Measures (Asbestos ATCM) for Construction, Grading, Quarrying, and Surface Mining Operations to the AQMD of Sacramento, Placer, and El Dorado Counties with required fees. The Plan would specify dust mitigation practices sufficient to ensure that no equipment or operation emits dust that is visible crossing the project boundary line. Construction would not commence until the Asbestos Dust Mitigation Plan is approved. The Contractor would then implement the approved ADMP in areas where project construction would involve disturbing lands that may harbor naturally occurring asbestos. The contractor would conduct cleanup of carryout and track-out by the following methods: Remove any visible track-out from a paved public road wherever vehicles exit the work site with a wet sweeper or a HEPA filter equipped vacuum device at least one time per day; or flush with water, if curbs or gutters are not present, and where the use of water will not result in a source of trackout material or result in adverse impacts on storm water drainage systems or violate any NPDES permit program. Use of blower devices, or dry rotary brushes or brooms for removal of carryout and track out on public roads would be prohibited. Install one or more of the following track-out prevention measures: A gravel pad designed using good engineering practices to clean the tires of exiting vehicles; A tire shaker; A wheel wash system; Pavement extending for not less than fifty consecutive feet from the intersection with the paved public road; or any other measure as effective as the measures listed above. Keep active storage piles adequately wetted or covered with tarps. Control for disturbed surface areas and storage piles that will remain inactive for more than seven days, which would include one or more of the following: Keep the surface adequately wetted; Establish and maintain surface crusting; Apply non-toxic, biodegradable dust suppressants or stabilizers according to the manufacturer's recommendations; Cover with tarp or vegetative cover; Install wind barriers of fifty percent porosity around three sides of a storage pile; Install wind barriers across open areas; or Take other measures as effective as the measures listed above. Control for traffic on on-site roads, parking lots, and staging areas which would include: A maximum vehicle speed limit of 15 miles per hour or less; and One or more of the following: Watering every two hours of active operations or sufficiently often to keep the area adequately wetted; Apply non-toxic, biodegradable dust suppressants consistent with manufacturer's directions; Maintain a gravel cover with a silt content that is less than 5 percent and asbestos content that is less than 0.25 percent, as determined using an approved asbestos bulk test method, to a depth of 3 inches on the surface being used for travel; or Any other measure as effective as the measures listed above. Control for earthmoving activities that would include one or more of the following: Pre-wetting the ground to the depth of anticipated cuts; Suspension of grading operation when wind speeds are high enough to result in dust emissions crossing the property lines, despite the application of dust mitigation measures;

ID #	DESCRIPTION
AQ-1 cont.	Application of water prior to any lands clearing; or Any other measure as effective as the measures listed above. Control for off-site transport. No truck would be allowed to transport excavated material off-site unless: Trucks are maintained such that no spillage would occur from holes or other opening sin cargo compartments; and Loads are adequately wetted and either Covered with tarps; or Loaded such that the material does not touch the front, back, or sides of the cargo compartment at any point less than six inches from the top and that no point of the load extends above the top of the cargo compartment. Post construction stabilization of disturbed areas. Upon completion of the project, disturbed surfaces would be stabilized using one or more of the following methods; Establishment of a vegetative cover; Placement of at least one foot of non-asbestos-containing material; Paving; Any other measure deemed sufficient to prevent wind speeds of ten miles per hour or greater from causing visible dust emissions.
AQ-2	Require construction contractor to implement the following fugitive dust mitigation measures: (1) Limit vehicle speeds on unpaved roads to 15 mph; (2) Water at least every 2 hours of active construction or often enough to keep disturbed areas adequately wet; (3) Remove all visible track-out from a paved public road at any location where vehicles exit the work site; (4) Install track-out prevention measures approved by the USACE; (5) Pre-wet the ground to the depth of anticipated cuts; (6) Suspend any excavation operations when wind speeds are high enough to result in dust emissions across property lines.
AQ-3	Require construction contractor to implement the following enhanced fugitive particulate matter dust control measures: (1) Water exposed soil to keep moist but do not allow sediment flows off site; (2) Suspend excavation, grading and/or demolition activity when wind speeds exceed 20-mph; (3) Install wind breaks on windward sides of construction areas; (4) Plant vegetative ground cover in disturbed areas as soon as possible; (5) For unpaved construction roads – (a) Install wheel washers or wash off all and equipment leaving the site; (b) Treat site access to a distance of 100 feet from the paved road with a 6-12 inch layer of wood chips, mulch or gravel; (c) Post a publicly visible sign with, the telephone number and person to contact at the lead agency regarding dust complaints that would be corrected within 48 hours of receipt, and the numbers of the Air Quality Management District (AQMD) of Sacramento, Placer and El Dorado, depending on jurisdiction.
AQ-4	Require construction contractor to implement the following basic emissions control practices: (1) Minimize idling time of equipment not in use to 5 minutes and post clear signage of this requirement for workers at site entrances; (2) Maintain all construction equipment in proper working condition and have equipment checked before operation by a certified mechanic; (3) Water exposed surfaces twice per day; (4) Cover or maintain at least 2 feet of free board space on trucks transporting soil, sand or other loose material onsite and all haul trucks slated for travel along freeways or major roadways must be covered; (5) Limit vehicle speeds on unpaved roads to 15 mph; (6) Use wet power vacuum street sweepers to remove any visible trackout mud or dirt onto adjacent public roads when necessary; (7) Provide current certificate(s) of compliance for CARB's In-Use Off-Road Diesel-Fueled Fleets Regulation.

ID #	DESCRIPTION
AQ-5	Submit to the USACE and appropriate AQMD(s) a comprehensive inventory of all off-road construction equipment, equal to or greater than 50 hp, that would be used an aggregate of 40 or more hours during any portion of the construction project. The inventory would include the horsepower rating, engine model year, and projected hours of use for each piece of equipment. The inventory would be updated and submitted monthly throughout the duration of the project, except that an inventory would not be required for any 30-day period in which no construction activity occurs. At least 4 business days prior to the use of subject heavy-duty off-road equipment, the contractor would provide the jurisdictional AQMD(s) with the anticipated construction timeline including start date, and name and phone number of the project manager and on-site foreman. The SMAQMD's Model Equipment List can be used to submit this information
AQ-6	Require the construction contractor to comply with the following additional air quality mitigation measures: (1) Model year 2010 or newer haul trucks must be used for the duration of the project. If an occasion arises where there is limited availability of MY 2010 or new haul trucks, the contractor would need to demonstrate that MY 2010 or newer trucks are not available and get authorization from the USACE; (2) All off road diesel-powered construction equipment of greater than 50 hp will meet Tier-4 off road emission standards, where available. If a certain tier engine is not available, that equipment would be equipped with the next lower tier engine or an engine equipped with retrofit controls to reduce emissions of NOx and diesel PM to no more than the next available tier, unless certified by engine manufacturers that the use of such devices is not practical for specific engine types, and any uses of heavy-duty off road diesel equipment that does not meet Tier 4 emissions standards would first require approval by the USACE; (3) All construction equipment would be equipped with best available technology devices certified by CARB. Any emission control device would achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations; (4) Construction equipment would incorporate emissions-reducing technology and idling would be restricted to a maximum of 5 minutes except as provided in the CARB 13CCR, Section 2485 exceptions.

ID #	DESCRIPTION
AQ-7	Require the construction contractor to comply with the following off-site compensatory mitigation measures: (1) Provide the USACE and the applicable local AQMDs with updated and revised air quality emissions estimates prior to beginning project construction activities on a given phase. If the estimates indicate the applicable PM_{10}threshold and/or the $PM_{2.5}$ threshold would be exceeded, the contractor would coordinate with the AQMDs in which the excess emissions occurred to determine the level of mitigation and administrative fees, if any, that must be paid; (2) Provide monthly estimates of actual PM_{10} and $PM_{2.5}$ emissions to the USACE and the applicable AQMDs once construction activities begin, indicating, if necessary, in which AQMD jurisdiction the emissions occurred. When a monthly report indicates PM emissions exceeded the applicable local AQMD threshold, the contractor would be required to pay the appropriate mitigation fee and associated administrative fee to the local AQMD in which the excess emissions occurred; (3) Provide monthly reports of estimated actual NOx emissions and if NOx thresholds are exceeded, the contractor would pay the appropriate mitigation fee and associated administrative fee to the local AQMD in which the excess emissions occurred.
	CLIMATE CHANGE
CC-1	The contractor would be required to submit monthly estimates of actual construction emissions to USACE and applicable local AQMDs. If these monthly reports show that emissions may eventually exceed 10,000 MT CO_2e per year (Placer County Air Pollution Control District threshold), or 1,100 MT CO_2e per year (SMAQMD threshold), the contractor would be required to prepare a greenhouse gas (GHG) emissions reduction plan for approval by the USACE, then implement the approved plan. Elements of such a plan could include the following: (1) Minimize the idling time of construction equipment to no more than 3 minutes, or shut equipment off when not in use, (2) Encourage carpools, shuttle vans, and/or alternative modes of transportation for construction worker commutes, (3) Use of CARB approved low carbon fuel, (4) Use of equipment with new technologies.
CC-2	If actual CO_2e emissions during construction of a given project phase do exceed either the PCAPCD threshold (10,000 MT CO_2e per year), or the SMAQMD threshold (1,100 MT CO_2e per year) then compensatory mitigation would be provided in the form of purchasing sufficient carbon credits to mitigate for the excess CO_2e. Carbon offset credits would be purchased from a carbon registry that is acceptable to the applicable local Air Quality Management District and the USACE. Note that the provision of compensatory mitigation would only be required under the following scenarios: (1) Project construction emissions that occur within Placer County exceed the PCAPCD threshold of 10,000 MT CO_2e per year, or; (2) Project construction emissions that occur within Sacramento County exceed the SMAQMD recommended threshold of 1,100 MT CO_2e per year.
	AESTHETICS & VISUAL RESOURCES

ID #	DESCRIPTION
AV-1	The construction contractor would: (1) Preserve existing native trees to the extent practicable; (2) Locate staging areas on previously disturbed lands where feasible; (3) Use anti-graffiti coatings on the concrete floodwalls; (4) Following construction, restore staging areas to pre-construction topography to the degree practicable and hydroseed the areas with native grasses and forbs. Exceptions to this measure would include: (a) Staging areas on the lake side of Dikes 4, 5, and 6; (b) Staging areas situated on existing urban/disturbed lands, with the exception of the Dike 7 Office Complex staging area, would not be restored, but would instead be returned to conditions present prior to the project.
	TRAFFIC & CIRCULATION
TC-1	Prior to starting construction, the contractor would be required to prepare a traffic management plan for approval by the USACE and would then implement the approved plan. This plan would outline proposed travel and haul routes along with proposed traffic management/maintenance/safety measures.
TC-2	High collision intersections would be identified by the USACE and avoided by project construction vehicles and equipment if possible.
TC-3	Construction vehicle and haul truck drivers would be informed and trained on the various types of access and haul routes, as well as areas that are more sensitive to traffic increases.
TC-4	The construction contractor would develop and use signs to inform the public of the construction access routes and haul routes, route changes, detours, and planned road closures to minimize traffic congestion and help ensure public safety.
TC-5	Traffic along Park Road will be detoured west of the Dike 1 work zone via a temporary signalized one-way lane on top of the existing Dike 1.
TC-6	Prior to beginning construction of the proposed new temporary access and dedicated right turn lane off Auburn-Folsom Road across from Bell Drive (e.g. primary ingress/egress route when raising Dikes 4 through 6), the contractor would be required to obtain an encroachment permit from Placer County Department of Public Works and Facilities. The contractor's application must include a detailed paving plan, traffic control, and signage plan, along with any other information Placer County requires for permit issuance.
	NOISE
N-1	Construction noise would be limited in accordance with timeframes and requirements in the City of Folsom, Sacramento County, and Placer County Noise Ordinance exemption for construction. If construction must occur outside of the exempted timeframe in the vicinity of sensitive receptors, the construction contractor would be required to meet the City of Folsom exterior noise thresholds. Construction noise is exempt from these standards during the periods of 7:00 a.m. to 6:00 p.m. on weekdays and 8:00 a.m. to 5:00 p.m. on weekends.

ID #	DESCRIPTION
N-2	To help minimize construction noise effects to campers utilizing the Beal's Point campgrounds, construction activities at Dike 6 would be limited to the construction noise exemption times specified by the City of Folsom Noise Ordinance (e.g. 7am to 6pm on weekdays, and 8am to 5 pm on weekends). In addition, no construction activities would be allowed at Dike 6 on weekends (Saturdays and Sundays). There could be limited exceptions to these requirements. Examples of potential exceptions include things such as emergency actions, corrective actions to ensure safety, transporting special equipment, etc. The construction contractor would first have to obtain USACE approval before performing construction work outside of the timeframes specified above.
N-3	Construction equipment noise would be minimized during project construction by muffling and shielding intakes and exhaust on construction equipment (per the manufacturer's specifications), and by shrouding or shielding impact tools.
N-4	All equipment, haul trucks, and worker vehicles would be turned off when not in use for more than 5 minutes.
N-5	Equipment warm up areas, water tanks, and equipment storage areas would be located as far from existing residences as is feasible.
N-6	Written notice of impending construction work would be provided to potentially affected residences (typically those located with approximately 2,000 feet of proposed construction activities) at least 2 weeks prior to mobilization of a give project phase. These notices would identify the type, duration, and frequency of construction activities. Notification materials would also identify a mechanism to register complaints if construction noise levels are overly intrusive.
N-7	The contractor would measure surface velocity waves caused by equipment and monitor vibration up to a threshold value established and approved in writing by the USACE. There would be no vibration exceeding 0.2 inch per second. Such measurements would only be taken near residences and occupied buildings that could be adversely affected by excessive ground vibrations.
N-8	A 24-hour telephone hotline for noise complaints would be established by the construction contractor. Any complaint calls not answered at the time of the call would be returned within approximately 24 hours of their receipt, as long as the message left includes a call-back phone number.
N-9	Public meetings would be scheduled prior to construction of a given project phase to help ensure residents that may be affected by construction noise are informed of the project schedule and its potential effects.
	WATER QUALITY & WATERS OF THE UNITED STATES
WW-1	Prior to construction of a given project phase, the contractor would be required to obtain a Construction General Permit (CGP - basically a National Pollutant Discharge Elimination System (NPDES) permit) from the Central Valley Regional Water Quality Control Board (CVRWQCB). This includes preparing a Stormwater Pollution Prevention Plan (SWPPP) and a Spill Prevention and Control Plan (SPCP) for approval by the USACE and CVRWQCB prior to initiating construction activities.

ID #	DESCRIPTION
WW-2	Appropriate erosion control measures would be incorporated into the SWPPP by the construction contractor in order to prevent sediment from entering wetlands, waterways, and waterbodies, and to minimize temporary turbidity impacts. Examples include but are not limited to: straw bales/wattles, erosion blankets, silt fencing, silt curtains, mulching, revegetation, and temporary covers. Sediment and erosion control measures would be maintained by the contractor during construction at all times. Control measures would be inspected periodically by the construction contractor, particularly during and after significant rain events.
WW-4	A fuels spill management plan would be developed and implemented for the project by the construction contractor.
WW-5	Construction equipment and vehicles would be fueled and maintained in specified staging areas only, which would be designed to capture potential spills and not release them into any ditch, stream, river, or other body of water or feature that may convey water to a nearby body of water or wetland.
WW-6	Fuels and hazardous materials would not be stored on site, unless otherwise approved by the USACE and such substances are stored in areas designed to contain leaks and spills. Any spills of hazardous material would be cleaned up immediately by the construction contractor.
WW-7	Construction vehicles and equipment would be inspected frequently and appropriately maintained by the construction contractor to help prevent dripping of oil, lubricants, or any other fluids.
WW-8	Construction activities involving removal (excavation) of material from the dikes, RWD, LWD, or MIAD as well as placement of material on these same features would be scheduled by the contractor to avoid as much of the wet season as practicable in cases where these activities may occur below the ordinary high water elevation of Folsom Lake.
WW-9	Construction personnel would be trained in stormwater pollution prevention practices by the construction contractor.
WW-10	In areas proposed for revegetation, initiation and completion of revegetation work would be done by the contractor in a timely manner to control erosion.
WW-11	If any portion of the project impacts wetlands, the USACE would obtain a Clean Water Act Section 401 Water Quality Certification (WQC) from CVRWQCB prior to starting such construction activities.
WW-12	The construction contractor would be required to implement and/or adhere to applicable conditions and requirements set forth in the CGP and, if applicable, the Section 401 WQC.
WW-13	The contractor would be required to properly dispose of oil and similar potential pollutants, including hazardous wastes, off-site in a duly licensed facility.

ID #	DESCRIPTION
WW-14	The construction contractor would be required to abide by the following restrictions pertaining to the use of construction staging areas that extend into Folsom Lake: (1) Use must first be approved in writing by the USACE; (2) Use is strictly prohibited when the area is inundated by standing water or the water table underlying the staging area is within 6 inches of the soil surface; (3) Topographic alterations, including grading, excavation, or deposition of fill materials, are prohibited; (4) Clearing or removal of existing vegetation is prohibited; (5) Stockpiling of construction materials or wastes is prohibited; (6) Fueling of construction equipment or vehicles is prohibited; (7) Storage of fuel, hazardous wastes, or other potential pollutants is prohibited.
WW-15	USACE environmental staff would conduct new jurisdictional determinations (e.g. field mapping and classification of jurisdictional Waters of the United States; WOUS) prior to finalizing design plans for a particular project phase. The design plans would then be refined, if necessary, to ensure construction of the project phase would not necessitate direct impacts (e.g. placement of fill, excavation, land clearing) to any jurisdictional wetlands or watercourses. The contractor would be required to protect all such features located within or immediately adjacent to the project limits of construction. Such protection would include the installation of temporary physical barriers, such as orange mesh fencing adjacent to the boundaries of the wetlands and/or watercourses.
WW-16	During construction of the Tainter gates refinements phase of the proposed project, the construction contractor would be required to abide by the following requirements in accordance with 29 CFR 1926.62 “Lead”, and 8 CCR 1532.1 “Lead”: (1) Lead dust on surfaces, especially in eating areas, must be controlled by HEPA vacuuming, wet cleanup, or other effective methods; (2) Workers must have washing facilities with soap and clean water; (3) Workers must receive training on lead hazards and how to protect themselves; (4) Develop a written compliance program, approved by the USACE, to assure control of hazardous lead exposures; (5) Assess the amounts of lead breathed by workers and provide workers with appropriate respirators (if warranted based on air sampling results and medical monitoring results).

ID #	DESCRIPTION
WW-17	To remove water via water intake pipes in Folsom Lake, the contractor would use the following drafting operating guidelines: Do not exceed pumping rate of 350 gallons per minute. Terminate pumping when the tank is full. Encircle each pumping intake with a silt curtain or filtering barrier that does not have openings greater than 1/32 of an inch in size in to prevent entrainment of young fish (fry) and other aquatic organisms. Remove any fish present from within the encircled curtain or barrier before pumping begins. For each pumping operation, attach a functional fish screen on the intake pipe. The screen would be designed and used such that it can be submerged with at least one-screen-height-clearance above and below the screen. Retain a log on the truck containing the following information: Operator's Name, Date, Time, Pump Rate, Filling Time, Screen Cleaned (Y or N), Screen Condition, Comments. Include these guidelines as instructions in a logbook with serially numbered pages. The contractor would be required to report the amount of water draw from Folsom Lake monthly to the Bureau of Reclamation Central California Area Office. If the contractor chooses to use locations for pumping water from Folsom Lake other than those identified in this document, the contractor would coordinate with USACE environmental and cultural staff for clearance and appropriate documentation before the sites could be used.
	CULTURAL RESOURCES
CR-1	In the event that previously unknown cultural resources are discovered during the project, all ground-disturbing activities shall immediately cease within the area of the discovery until USACE has met the requirement of 36 CFR 800.13 regarding post-review discoveries. Work shall not resume in the area surrounding the potential historic property until USACE re-authorizes project construction. In accordance with CEQA, if Tribal Cultural Resources or other potential historical resources are found during project implementation, procedures to reduce potentially significant impacts to those cultural resources to less than significant also would occur. More specifically, CVFPB would ensure that discovered resources are evaluated for CRHR eligibility through application of established eligibility criteria (CCR 15064.636), in consultation with interested Native American Tribes. Impacts to historical resources and/or Tribal Cultural Resources would be avoided or mitigated to less than significant levels in accordance with California PRC Section 21084.3. Such avoidance and Mitigation Measures include, but are not limited to, preservation and protection in place; safeguarding resource confidentiality; and treating the resource with appropriate dignity, taking into account Tribal cultural values. Because the project is located entirely on federal land, in the event that any Native American human remains are encountered during construction or related activities, work would stop and appropriate treatment measures implemented, pursuant to the Native American Graves Protection and Repatriation Act (NAGPRA).
	MISCELLANEOUS

ID #	DESCRIPTION
M-1	Upon or near completion of construction of the overall Folsom Dam Raise Modifications project, a revised Water Control Manual (WCM) would need to be prepared that accounts for the added flood risk reduction capabilities the Folsom Dam Raise facilities (Main Dam Tainter Gate modifications, dikes, LWD, RWD, MIAD) provide. The USACE, in coordination with DWR, SAFCA, and USBR, would prepare subsequent environmental documentation that would evaluate the potential effects of implementing the revised WCM. This document would be finalized and approved prior to implementation of the revised WCM.

Paving	0	57	120	120	360	0

[1.] Total Material Imported/Exported Volume (yd^3/day)
[2.] Daily VMT (miles/day)
PM10 and PM2.5 estimates assume 50% control of fugitive dust from watering and associated dust control measures if a minimum number of water trucks are specified.
Total PM10 emissions shown in column F are the sum of exhaust and fugitive dust emissions shown in columns G and H. Total PM2.5 emissions shown in Column I are the sum of exhaust and fugitive dust emissions shown in columns J and K.
CO2e emissions are estimated by multiplying mass emissions for each GHG by its global warming potential (GWP), 1 , 25 and 298 for CO2, CH4 and N2O, respectively. Total CO2e is then estimated by summing CO2e estimates over all GHGs.

Total Emission Estimates by Phase for -> Dikes 1-3 Raise 2022 Unmitigated

[1.] Total Material Imported/Exported Volume (yd^3/day)
[2.] Daily VMT (miles/day)
PM10 and PM2.5 estimates assume 50% control of fugitive dust from watering and associated dust control measures if a minimum number of water trucks are specified.
Total PM10 emissions shown in column F are the sum of exhaust and fugitive dust emissions shown in columns G and H. Total PM2.5 emissions shown in Column I are the sum of exhaust and fugitive dust emissions shown in columns J and K.
CO2e emissions are estimated by multiplying mass emissions for each GHG by its global warming potential (GWP), 1 , 25 and 298 for CO2, CH4 and N2O, respectively. Total CO2e is then estimated by summing CO2e estimates over all GHGs.

[2.] Daily VMT (miles/day)
PM10 and PM2.5 estimates assume 50% control of fugitive dust from watering and associated dust control measures if a minimum number of water trucks are specified.
Total PM10 emissions shown in column F are the sum of exhaust and fugitive dust emissions shown in columns G and H. Total PM2.5 emissions shown in Column I are the sum of exhaust and fugitive dust emissions shown in columns J and K.
CO2e emissions are estimated by multiplying mass emissions for each GHG by its global warming potential (GWP), 1 , 25 and 298 for CO2, CH4 and N2O, respectively. Total CO2e is then estimated by summing CO2e estimates over all GHGs.

[4]. Metric tonnes (MT/phase)
PM10 and PM2.5 estimates assume 50% control of fugitive dust from watering and associated dust control measures if a minimum number of water trucks are specified.
Total PM10 emissions shown in column F are the sum of exhaust and fugitive dust emissions shown in columns G and H. Total PM2.5 emissions shown in Column I are the sum of exhaust and fugitive dust emissions shown in columns J and K.
CO2e emissions are estimated by multiplying mass emissions for each GHG by its global warming potential (GWP), 1 , 25 and 298 for CO2, CH4 and N2O, respectively. Total CO2e is then estimated by summing CO2e estimates over all GHGs.
The CO2e emissions are reported as metric tons per phase.

Road Construction Emissions Model, Version 9.0.0

Orange highlighted cells shows overlapped project phases, maximum daily emissions shown below have been adjusted to account for phase overlap

[2.] Daily VMT (miles/day)
PM10 and PM2.5 estimates assume 50% control of fugitive dust from watering and associated dust control measures if a minimum number of water trucks are specified.
Total PM10 emissions shown in column F are the sum of exhaust and fugitive dust emissions shown in columns G and H. Total PM2.5 emissions shown in Column I are the sum of exhaust and fugitive dust emissions shown in columns J and K.
CO2e emissions are estimated by multiplying mass emissions for each GHG by its global warming potential (GWP), 1 , 25 and 298 for CO2, CH4 and N2O, respectively. Total CO2e is then estimated by summing CO2e estimates over all GHGs.

[3]. Tons (tons/phase)
[4]. Metric tonnes (MT/phase)
PM10 and PM2.5 estimates assume 50% control of fugitive dust from watering and associated dust control measures if a minimum number of water trucks are specified.
Total PM10 emissions shown in column F are the sum of exhaust and fugitive dust emissions shown in columns G and H. Total PM2.5 emissions shown in Column I are the sum of exhaust and fugitive dust emissions shown in columns J and K.
CO2e emissions are estimated by multiplying mass emissions for each GHG by its global warming potential (GWP), 1 , 25 and 298 for CO2, CH4 and N2O, respectively. Total CO2e is then estimated by summing CO2e estimates over all GHGs.
The CO2e emissions are reported as metric tons per phase.

[2.] Daily VMT (miles/day)
PM10 and PM2.5 estimates assume 50% control of fugitive dust from watering and associated dust control measures if a minimum number of water trucks are specified.
Total PM10 emissions shown in column F are the sum of exhaust and fugitive dust emissions shown in columns G and H. Total PM2.5 emissions shown in Column I are the sum of exhaust and fugitive dust emissions shown in columns J and K.
CO2e emissions are estimated by multiplying mass emissions for each GHG by its global warming potential (GWP), 1 , 25 and 298 for CO2, CH4 and N2O, respectively. Total CO2e is then estimated by summing CO2e estimates over all GHGs.

APPENDIX D

USFWS COORDINATION AND ENDANGERED SPECIES ACT CONSULTATION

IPaC **U.S. Fish & Wildlife Service**

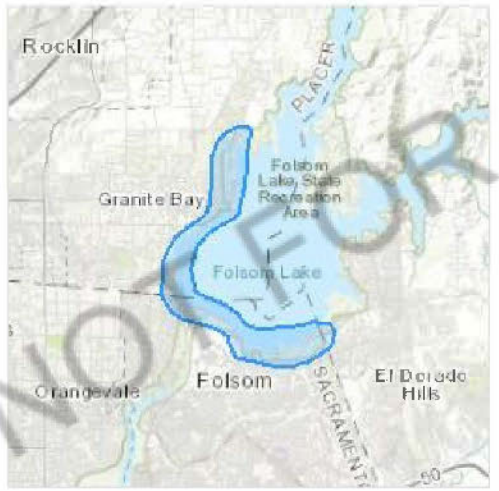
IPaC resource list

This report is an automatically generated list of species and other resources such as critical habitat (collectively referred to as *trust resources*) under the U.S. Fish and Wildlife Service's (USFWS) jurisdiction that are known or expected to be on or near the project area referenced below. The list may also include trust resources that occur outside of the project area, but that could potentially be directly or indirectly affected by activities in the project area. However, determining the likelihood and extent of effects a project may have on trust resources typically requires gathering additional site-specific (e.g., vegetation/species surveys) and project-specific (e.g., magnitude and timing of proposed activities) information.

Below is a summary of the project information you provided and contact information for the USFWS office(s) with jurisdiction in the defined project area. Please read the introduction to each section that follows (Endangered Species, Migratory Birds, USFWS Facilities, and NWI Wetlands) for additional information applicable to the trust resources addressed in that section.

Location

El Dorado, Placer, and Sacramento counties, California



Local office

Sacramento Fish And Wildlife Office

(916) 414-6600
(916) 414-6713

Federal Building
2800 Cottage Way, Room W-2605
Sacramento, CA 95825-1846

Endangered species

This resource list is for informational purposes only and does not constitute an analysis of project level impacts.

The primary information used to generate this list is the known or expected range of each species. Additional areas of influence (AOI) for species are also considered. An AOI includes areas outside of the species range if the species could be indirectly affected by activities in that area (e.g., placing a dam upstream of a fish population even if that fish does not occur at the dam site, may indirectly impact the species by reducing or eliminating water flow downstream). Because species can move, and site conditions can change, the species on this list are not guaranteed to be found on or near the project area. To fully determine any potential effects to species, additional site-specific and project-specific information is often required.

Section 7 of the Endangered Species Act **requires** Federal agencies to "request of the Secretary information whether any species which is listed or proposed to be listed may be present in the area of such proposed action" for any project that is conducted, permitted, funded, or licensed by any Federal agency. A letter from the local office and a species list which fulfills this requirement can **only** be obtained by requesting an official species list from either the Regulatory Review section in IPaC (see directions below) or from the local field office directly.

For project evaluations that require USFWS concurrence/review, please return to the IPaC website and request an official species list by doing the following:

1. Draw the project location and click CONTINUE.
2. Click DEFINE PROJECT.
3. Log in (if directed to do so).
4. Provide a name and description for your project.
5. Click REQUEST SPECIES LIST.

Listed species[1] and their critical habitats are managed by the Ecological Services Program of the U.S. Fish and Wildlife Service (USFWS) and the fisheries division of the National Oceanic and Atmospheric Administration (NOAA Fisheries[2]).

Species and critical habitats under the sole responsibility of NOAA Fisheries are **not** shown on this list. Please contact NOAA Fisheries for species under their jurisdiction.

1. Species listed under the Endangered Species Act are threatened or endangered; IPaC also shows species that are candidates, or proposed, for listing. See the listing status page for more information. IPaC only shows species that are regulated by USFWS (see FAQ).
2. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

The following species are potentially affected by activities in this location:

Reptiles

NAME	STATUS

Giant Garter Snake Thamnophis gigas — Threatened
Wherever found
No critical habitat has been designated for this species.
http://ecos.fws.gov/ecp/species/4482

Amphibians

NAME	STATUS

California Red-legged Frog Rana draytonii — Threatened
Wherever found
There is **final** critical habitat for this species. The location of the critical habitat is not available.
http://ecos.fws.gov/ecp/species/2891

California Tiger Salamander Ambystoma californiense — Threatened
There is **final** critical habitat for this species. The location of the critical habitat is not available.
http://ecos.fws.gov/ecp/species/2076

Fishes

NAME	STATUS

Delta Smelt Hypomesus transpacificus — Threatened
Wherever found
There is **final** critical habitat for this species. The location of the critical habitat is not available.
http://ecos.fws.gov/ecp/species/321

Insects

NAME	STATUS

Monarch Butterfly Danaus plexippus — Candidate
Wherever found
No critical habitat has been designated for this species.
http://ecos.fws.gov/ecp/species/9743

Valley Elderberry Longhorn Beetle Desmocerus californicus dimorphus — Threatened
Wherever found
There is **final** critical habitat for this species. The location of the critical habitat is not available.
http://ecos.fws.gov/ecp/species/7850

Crustaceans

NAME	STATUS

Conservancy Fairy Shrimp Branchinecta conservatio — Endangered
Wherever found
There is **final** critical habitat for this species. The location of the critical habitat is not available.
http://ecos.fws.gov/ecp/species/8246

Vernal Pool Fairy Shrimp Branchinecta lynchi — Threatened
Wherever found
There is **final** critical habitat for this species. The location of the critical habitat is not available.
http://ecos.fws.gov/ecp/species/498

Vernal Pool Tadpole Shrimp Lepidurus packardi — Endangered
Wherever found
There is **final** critical habitat for this species. The location of the critical habitat is not available.
http://ecos.fws.gov/ecp/species/2246

Flowering Plants

NAME	STATUS

El Dorado Bedstraw Galium californicum ssp. sierrae — Endangered
Wherever found
No critical habitat has been designated for this species.
http://ecos.fws.gov/ecp/species/5209

Layne's Butterweed Senecio layneae — Threatened
Wherever found
No critical habitat has been designated for this species.
http://ecos.fws.gov/ecp/species/4062

Pine Hill Ceanothus Ceanothus roderickii — Endangered
Wherever found
No critical habitat has been designated for this species.
http://ecos.fws.gov/ecp/species/3293

Pine Hill Flannelbush Fremontodendron californicum ssp. decumbens — Endangered
Wherever found
No critical habitat has been designated for this species.
http://ecos.fws.gov/ecp/species/4818

Sacramento Orcutt Grass Orcuttia viscida — Endangered
Wherever found
There is **final** critical habitat for this species. The location of the critical habitat is not available.
http://ecos.fws.gov/ecp/species/5507

Stebbins' Morning-glory Calystegia stebbinsii Endangered
Wherever found
No critical habitat has been designated for this species.
http://ecos.fws.gov/ecp/species/3991

Critical habitats

Potential effects to critical habitat(s) in this location must be analyzed along with the endangered species themselves.

THERE ARE NO CRITICAL HABITATS AT THIS LOCATION.

Migratory birds

Certain birds are protected under the Migratory Bird Treaty Act[1] and the Bald and Golden Eagle Protection Act[2].

Any person or organization who plans or conducts activities that may result in impacts to migratory birds, eagles, and their habitats should follow appropriate regulations and consider implementing appropriate conservation measures, as described below.

1. The Migratory Birds Treaty Act of 1918.
2. The Bald and Golden Eagle Protection Act of 1940.

Additional information can be found using the following links:

- Birds of Conservation Concern http://www.fws.gov/birds/management/managed-species/birds-of-conservation-concern.php
- Measures for avoiding and minimizing impacts to birds http://www.fws.gov/birds/management/project-assessment-tools-and-guidance/conservation-measures.php
- Nationwide conservation measures for birds http://www.fws.gov/migratorybirds/pdf/management/nationwidestandardconservationmeasures.pdf

The birds listed below are birds of particular concern either because they occur on the USFWS Birds of Conservation Concern (BCC) list or warrant special attention in your project location. To learn more about the levels of concern for birds on your list and how this list is generated, see the FAQ below. This is not a list of every bird you may find in this location, nor a guarantee that every bird on this list will be found in your project area. To see exact locations of where birders and the general public have sighted birds in and around your project area, visit the E-bird data mapping tool (Tip: enter your location, desired date range and a species on your list). For projects that occur off the Atlantic Coast, additional maps and models detailing the relative occurrence and abundance of bird species on your list are available. Links to additional information about Atlantic Coast birds, and other important information about your migratory bird list, including how to properly interpret and use your migratory bird report, can be found below.

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, click on the PROBABILITY OF PRESENCE SUMMARY at the top of your list to see when these birds are most likely to be present and breeding in your project area.

NAME	BREEDING SEASON (IF A BREEDING SEASON IS INDICATED FOR A BIRD ON YOUR LIST, THE BIRD MAY BREED IN YOUR PROJECT AREA SOMETIME WITHIN THE TIMEFRAME SPECIFIED, WHICH IS A VERY LIBERAL ESTIMATE OF THE DATES INSIDE WHICH THE BIRD BREEDS ACROSS ITS ENTIRE RANGE. "BREEDS ELSEWHERE" INDICATES THAT THE BIRD DOES NOT LIKELY BREED IN YOUR PROJECT AREA.)
Bald Eagle *Haliaeetus leucocephalus* This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities. http://ecos.fws.gov/ecp/species/1626	Breeds Jan 1 to Aug 31
California Thrasher *Toxostoma redivivum* This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds Jan 1 to Jul 31
Clark's Grebe *Aechmophorus clarkii* This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds Jun 1 to Aug 31
Common Yellowthroat *Geothlypis trichas sinuosa* This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA http://ecos.fws.gov/ecp/species/2084	Breeds May 20 to Jul 31
Golden Eagle *Aquila chrysaetos* This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities. http://ecos.fws.gov/ecp/species/1680	Breeds Jan 1 to Aug 31

Lawrence's Goldfinch Carduelis lawrencei — Breeds Mar 20 to Sep 20
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
http://ecos.fws.gov/ecp/species/9464

Marbled Godwit Limosa fedoa — Breeds elsewhere
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
http://ecos.fws.gov/ecp/species/9481

Nuttall's Woodpecker Picoides nuttallii — Breeds Apr 1 to Jul 20
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
http://ecos.fws.gov/ecp/species/9410

Oak Titmouse Baeolophus inornatus — Breeds Mar 15 to Jul 15
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
http://ecos.fws.gov/ecp/species/9656

Olive-sided Flycatcher Contopus cooperi — Breeds May 20 to Aug 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
http://ecos.fws.gov/ecp/species/3914

Tricolored Blackbird Agelaius tricolor — Breeds Mar 15 to Aug 10
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
http://ecos.fws.gov/ecp/species/3910

Wrentit Chamaea fasciata — Breeds Mar 15 to Aug 10
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Yellow-billed Magpie Pica nuttalli — Breeds Apr 1 to Jul 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
http://ecos.fws.gov/ecp/species/9726

Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read and understand the FAQ "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

Probability of Presence (■)

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

How is the probability of presence score calculated? The calculation is done in three steps:

1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.
2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.
3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

To see a bar's probability of presence score, simply hover your mouse cursor over the bar.

Breeding Season (▪)
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort (|)
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps. The number of surveys is expressed as a range, for example, 33 to 64 surveys.

To see a bar's survey effort range, simply hover your mouse cursor over the bar.

No Data (–)
A week is marked as having no data if there were no survey events for that week.

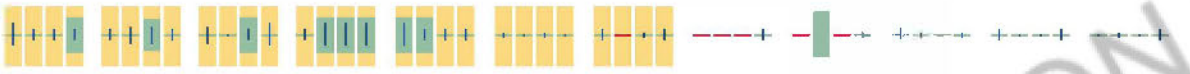
Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.

▪ probability of presence ▪ breeding season | survey effort – no data

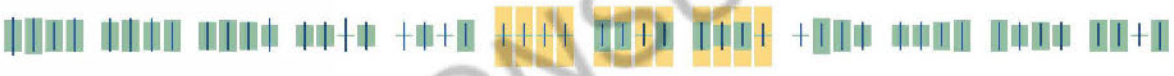
SPECIES	JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC

Bald Eagle Non-BCC Vulnerable (This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.)

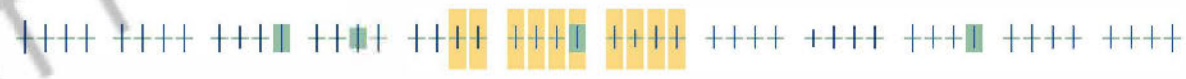
California Thrasher BCC Rangewide (CON) (This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.)



Clark's Grebe BCC Rangewide (CON) (This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.)

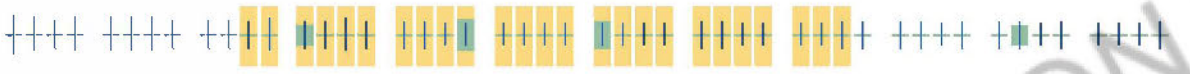


Common Yellowthroat BCC - BCR (This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA)



Golden Eagle Non-BCC Vulnerable (This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.)

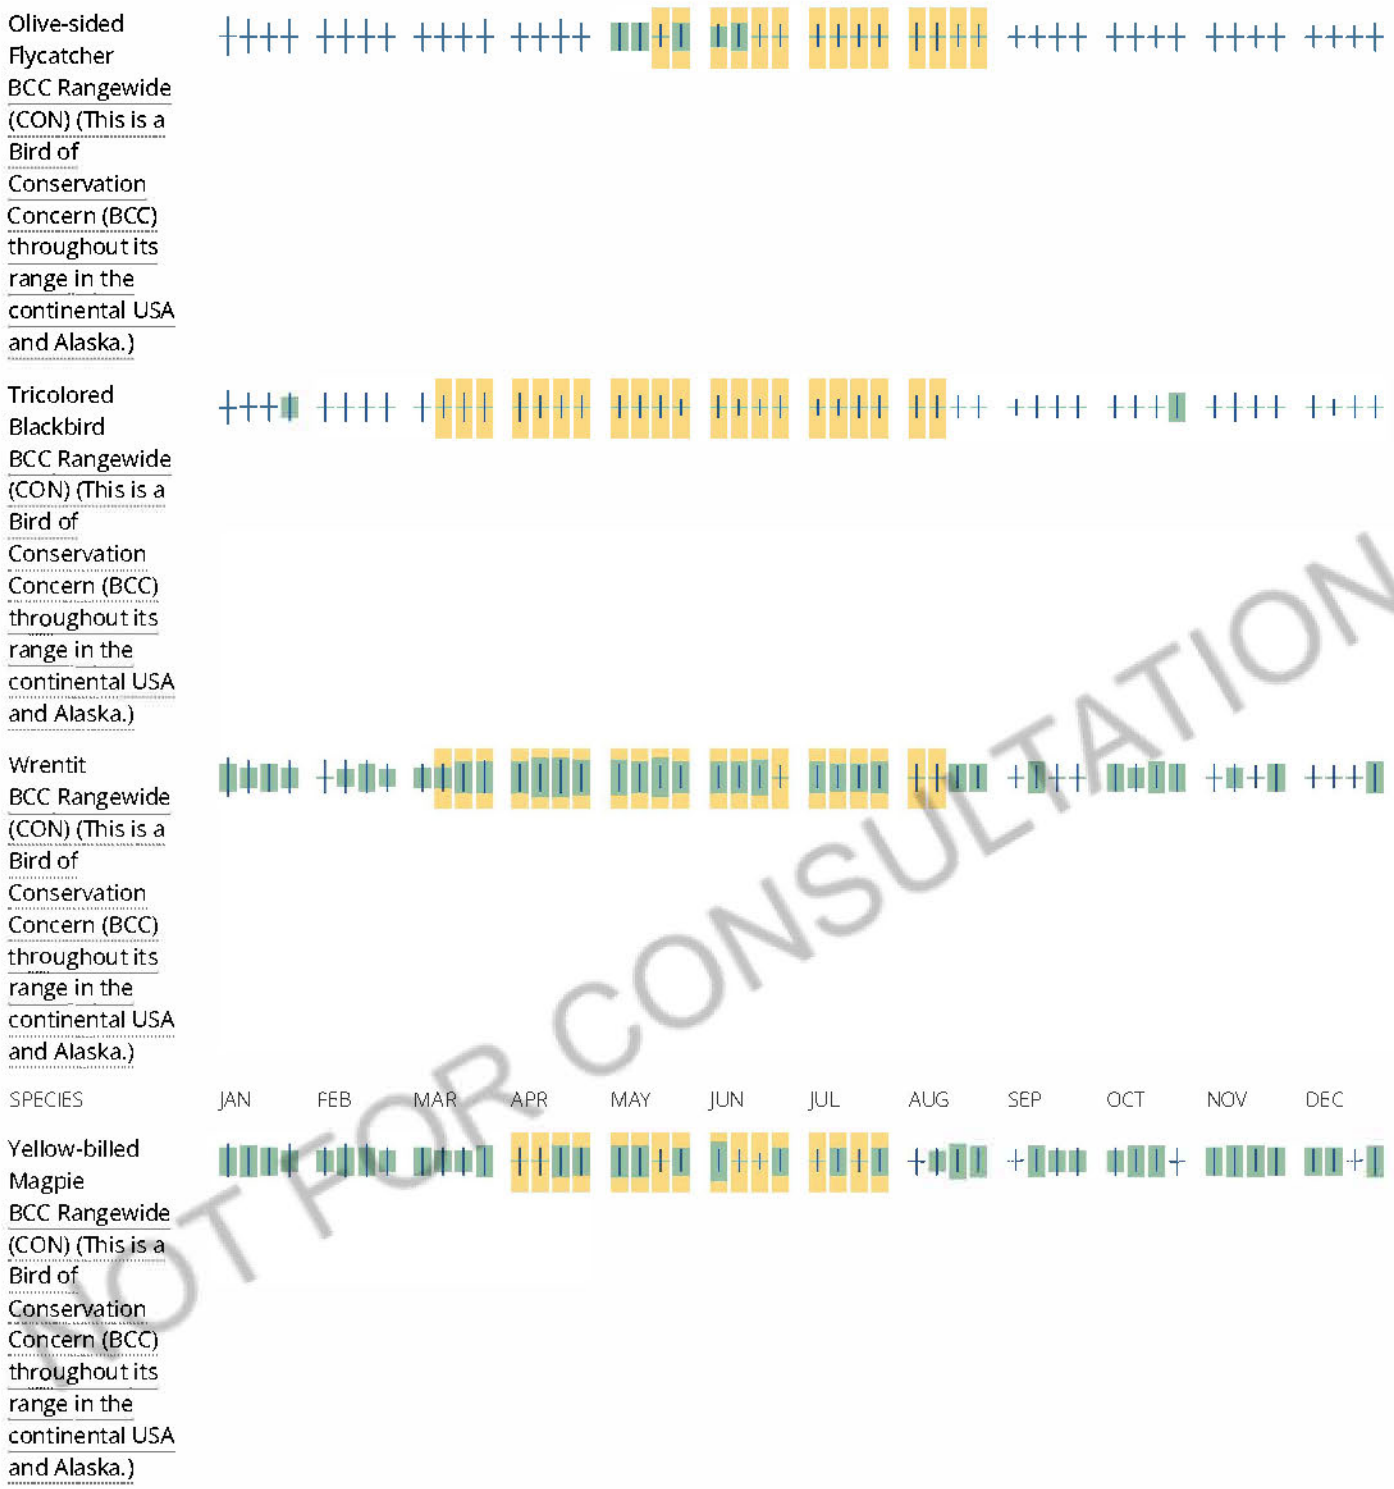
Lawrence's Goldfinch BCC Rangewide (CON) (This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.)



Marbled Godwit BCC Rangewide (CON) (This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.)

Nuttall's Woodpecker BCC - BCR (This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA)

Oak Titmouse BCC Rangewide (CON) (This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.)



Tell me more about conservation measures I can implement to avoid or minimize impacts to migratory birds.

Nationwide Conservation Measures describes measures that can help avoid and minimize impacts to all birds at any location year round. Implementation of these measures is particularly important when birds are most likely to occur in the project area. When birds may be breeding in the area, identifying the locations of any active nests and avoiding their destruction is a very helpful impact minimization measure. To see when birds are most likely to occur and be breeding in your project area, view the Probability of Presence Summary. Additional measures or permits may be advisable depending on the type of activity you are conducting and the type of infrastructure or bird species present on your project site.

What does IPaC use to generate the migratory birds potentially occurring in my specified location?

The Migratory Bird Resource List is comprised of USFWS Birds of Conservation Concern (BCC) and other species that may warrant special attention in your project location.

The migratory bird list generated for your project is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are a BCC species in that area, an eagle (Eagle Act requirements may apply), or a species that has a particular vulnerability to offshore activities or development.

Again, the Migratory Bird Resource list includes only a subset of birds that may occur in your project area. It is not representative of all birds that may occur in your project area. To get a list of all birds potentially present in your project area, please visit the AKN Phenology Tool.

What does IPaC use to generate the probability of presence graphs for the migratory birds potentially occurring in my specified location?

The probability of presence graphs associated with your migratory bird list are based on data provided by the Avian Knowledge Network (AKN). This data is derived from a growing collection of survey, banding, and citizen science datasets .

Probability of presence data is continuously being updated as new and better information becomes available. To learn more about how the probability of presence graphs are produced and how to interpret them, go the Probability of Presence Summary and then click on the "Tell me about these graphs" link.

How do I know if a bird is breeding, wintering, migrating or present year-round in my project area?

To see what part of a particular bird's range your project area falls within (i.e. breeding, wintering, migrating or year-round), you may refer to the following resources: The Cornell Lab of Ornithology All About Birds Bird Guide, or (if you are unsuccessful in locating the bird of interest there), the Cornell Lab of Ornithology Neotropical Birds guide. If a bird on your migratory bird species list has a breeding season associated with it, if that bird does occur in your project area, there may be nests present at some point within the timeframe specified. If "Breeds elsewhere" is indicated, then the bird likely does not breed in your project area.

What are the levels of concern for migratory birds?

Migratory birds delivered through IPaC fall into the following distinct categories of concern:

1. "BCC Rangewide" birds are Birds of Conservation Concern (BCC) that are of concern throughout their range anywhere within the USA (including Hawaii, the Pacific Islands, Puerto Rico, and the Virgin Islands);
2. "BCC - BCR" birds are BCCs that are of concern only in particular Bird Conservation Regions (BCRs) in the continental USA; and
3. "Non-BCC - Vulnerable" birds are not BCC species in your project area, but appear on your list either because of the Eagle Act requirements (for eagles) or (for non-eagles) potential susceptibilities in offshore areas from certain types of development or activities (e.g. offshore energy development or longline fishing).

Although it is important to try to avoid and minimize impacts to all birds, efforts should be made, in particular, to avoid and minimize impacts to the birds on this list, especially eagles and BCC species of rangewide concern. For more information on conservation measures you can implement to help avoid and minimize migratory bird impacts and requirements for eagles, please see the FAQs for these topics.

Details about birds that are potentially affected by offshore projects

For additional details about the relative occurrence and abundance of both individual bird species and groups of bird species within your project area off the Atlantic Coast, please visit the Northeast Ocean Data Portal. The Portal also offers data and information about other taxa besides birds that may be helpful to you in your project review.

Alternately, you may download the bird model results files underlying the portal maps through the NOAA NCCOS Integrative Statistical Modeling and Predictive Mapping of Marine Bird Distributions and Abundance on the Atlantic Outer Continental Shelf project webpage.

Bird tracking data can also provide additional details about occurrence and habitat use throughout the year, including migration. Models relying on survey data may not include this information. For additional information on marine bird tracking data, see the Diving Bird Study and the nanotag studies or contact Caleb Spiegel or Pam Loring.

What if I have eagles on my list?

If your project has the potential to disturb or kill eagles, you may need to obtain a permit to avoid violating the Eagle Act should such impacts occur.

Proper Interpretation and Use of Your Migratory Bird Report

The migratory bird list generated is not a list of all birds in your project area, only a subset of birds of priority concern. To learn more about how your list is generated, and see options for identifying what other birds may be in your project area, please see the FAQ "What does IPaC use to generate the migratory birds potentially occurring in my specified location". Please be aware this report provides the "probability of presence" of birds within the 10 km grid cell(s) that overlap your project; not your exact project footprint. On the graphs provided, please also look carefully at the survey effort (indicated by the black vertical bar) and for the existence of the "no data" indicator (a red horizontal bar). A high survey effort is the key component. If the survey effort is high, then the probability of presence score can be viewed as more dependable. In contrast, a low survey effort bar or no data bar means a lack of data and, therefore, a lack of certainty about presence of the species. This list is not perfect; it is simply a starting point for identifying what birds of concern have the potential to be in your project area, when they might be there, and if they might be breeding (which means nests might be present). The list helps you know what to look for to confirm presence, and helps guide you in knowing when to implement conservation measures to avoid or minimize potential impacts from your project activities, should presence be confirmed. To learn more about conservation measures, visit the FAQ "Tell me about conservation measures I can implement to avoid or minimize impacts to migratory birds" at the bottom of your migratory bird trust resources page.

Facilities

National Wildlife Refuge lands

Any activity proposed on lands managed by the National Wildlife Refuge system must undergo a 'Compatibility Determination' conducted by the Refuge. Please contact the individual Refuges to discuss any questions or concerns.

THERE ARE NO REFUGE LANDS AT THIS LOCATION.

Fish hatcheries

THERE ARE NO FISH HATCHERIES AT THIS LOCATION.

Wetlands in the National Wetlands Inventory

Impacts to NWI wetlands and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local U.S. Army Corps of Engineers District.

Please note that the NWI data being shown may be out of date. We are currently working to update our NWI data set. We recommend you verify these results with a site visit to determine the actual extent of wetlands on site.

This location overlaps the following wetlands:

FRESHWATER EMERGENT WETLAND

- PEM1Ch
- PEM1C
- PEM1A
- PEM1Cx
- PEM1Ah

FRESHWATER FORESTED/SHRUB WETLAND

- PSSCx
- PFOA
- PSSC

FRESHWATER POND

- PUBHr
- PUBHh
- PUBH
- PUBF
- PABF
- PUBFx
- PUBFh

LAKE

- L1UBHh
- L2USCh

RIVERINE

- R4SBC
- R5UBFx
- R5UBF

A full description for each wetland code can be found at the National Wetlands Inventory website

Data limitations

The Service's objective of mapping wetlands and deepwater habitats is to produce reconnaissance level information on the location, type and size of these resources. The maps are prepared from the analysis of high altitude imagery. Wetlands are identified based on vegetation, visible hydrology and geography. A margin of error

is inherent in the use of imagery; thus, detailed on-the-ground inspection of any particular site may result in revision of the wetland boundaries or classification established through image analysis.

The accuracy of image interpretation depends on the quality of the imagery, the experience of the image analysts, the amount and quality of the collateral data and the amount of ground truth verification work conducted. Metadata should be consulted to determine the date of the source imagery used and any mapping problems.

Wetlands or other mapped features may have changed since the date of the imagery or field work. There may be occasional differences in polygon boundaries or classifications between the information depicted on the map and the actual conditions on site.

Data exclusions

Certain wetland habitats are excluded from the National mapping program because of the limitations of aerial imagery as the primary data source used to detect wetlands. These habitats include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (coral or tuberficid worm reefs) have also been excluded from the inventory. These habitats, because of their depth, go undetected by aerial imagery.

Data precautions

Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of this inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local government or to establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate federal, state, or local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

SEP 20 2019

Mr. Mark T. Ziminski
Chief, Environmental Resources Branch
Corps of Engineers, Sacramento District
1325 J Street
Sacramento, California 95814

Subject: Reinitiation of Formal Consultation on the Proposed Folsom Dam Raise Project, Sacramento, El Dorado, and Placer Counties, California

Dear Mr. Ziminske:

This letter is in response to the Corps of Engineers' (Corps) September 9, 2019, request for reinitiation of formal consultation with the U.S. Fish and Wildlife Service (Service) on the proposed Folsom Dam Raise Project (proposed project) in Sacramento, El Dorado, and Placer Counties, California. Your request was received by the Service on September 9, 2019. The Service issued a biological opinion for this project on October 13, 2016 (08ESMF00-F-0043) that analyzed the project's effects on the federally-listed as threatened valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*) (beetle). This response is provided under the authority of the Endangered Species Act of 1973, as amended (16 U.S.C. 1531 *et seq.*) (Act), and in accordance with the implementing regulations pertaining to interagency cooperation (50 CFR 402).

Since the Service issued the biological opinion, the Corps has determined the Folsom Residence Office needs to be moved. The office, currently located near Folsom State Prison will be moved about 880 feet northeast to a parking lot near Folsom Lake Dike 7 (former Dike 7 Office Complex area). The move is anticipated to occur January through March 2020, and last about 12 weeks.

A single elderberry shrub is located on the north side of the entrance to the Dike 7 parking lot near Folsom Lake Crossing. The shrub is located in close proximity to the road, but is protected behind a fence. No construction activity is proposed behind the fence and no trimming is anticipated for access to the site by modular building installers. However, delivery and contractor vehicles will travel the adjacent road. Based on implementation of the Conservation Measures identified in the biological opinion, the Corps has determined the Folsom Residence Office move may affect, but is not likely to adversely affect the beetle or its habitat. Pursuant to Conservation Measure 2 in the biological opinion, the Corps is also seeking approval from the Service to establish a buffer around an elderberry shrub less than 20 feet.

The Service concurs with the Corps' determination that moving the Folsom Residence Office may affect, but is not likely to adversely affect the beetle or its habitat. The Service also agrees to the Corps' proposal of a minimum setback less than 20 feet for a single elderberry shrub along the access road to the office site. The biological opinion will be amended to reflect these changes. To

provide ease of reading, the new language in the biological opinion will be in bold text. Therefore, the Folsom Dam Raise Project biological opinion is amended as follows:

Page 2. Consultation History

April 9, 2014:	The Service, Reclamation, and the Department of Water Resources conducted an elderberry shrub survey of the proposed project footprint
September 6 2016:	The Service received the September 6, 2016, letter from the Corps requesting reinitiation of formal consultation with undated biological assessment.
September 9, 2019:	**The Service received a request (undated) to reinitate consultation related to moving the location of the Folsom Residence Office for the proposed project and establishing a minimum setback (buffer) of less than 20 feet for a single elderberry shrub along the road to the proposed Folsom Resident Office site.**

Page 5. Earthen Raise Elements

Construction staging areas for the proposed work on dike 7 will include the existing "Dike 7 complex" area immediately south of the dike, plus previously disturbed land along the north side of the dike (see Enclosure, Figure 10). Both of these areas have been used as staging areas during various Folsom JFP construction phases. The main construction staging area for Dike 8 will likely be a previously disturbed area immediately adjacent to the north side of this dike (see Enclosure, Figure 10), but the Dike 7 Office Complex site may be used. **A portion of the Dike 7 Office Complex site may also be used as a future office site if needed.**

All other sections of the October 13, 2016, biological opinion for the Folsom Dam Raise Project remain the same. If you have any questions regarding this biological opinion please contact Doug Weinrich (douglas_weinrich@fws.gov), Assistant Field Supervisor, at (916) 414-6563.

Sincerely,

Doug Weinrich

for Jennifer M. Norris, Ph.D.
Field Supervisor

JAN 15 2020

Mr. Mark T. Ziminiske
Chief, Environmental Resources Branch
Corps of Engineers, Sacramento District
1325 J Street
Sacramento, California 95814

Subject: Reinitiation of Formal Consultation on the Proposed Folsom Dam Raise Project, Sacramento, El Dorado and Placer Counties, California

Dear Mr. Ziminske:

This letter is in response to the Corps of Engineers' (Corps) December 10, 2019, request for reinitiation of formal consultation with the U.S. Fish and Wildlife Service (Service) on the proposed Folsom Dam Raise Project (proposed project) in Sacramento, El Dorado, and Placer Counties, California. Your request was received by the Service on December 16, 2019. The Service issued a biological opinion for this project on October 13, 2016 (08ESMF00-F-0043) and a subsequent reinitiation of consultation (08ESMF00-F-0043-R001) on September 20, 2019, that analyzed the project's effects on the federally-listed as threatened valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*) (beetle). This response is provided under the authority of the Endangered Species Act of 1973, as amended (16 U.S.C. 1531 *et seq.*) (Act), and in accordance with the implementing regulations pertaining to interagency cooperation (50 CFR 402).

Since the Service issued the biological opinion and first reinitiation, the Corps has determined about 2,300 feet of the Pioneer Express Trail needs to be widened from about 2 feet to 4-6 feet to accommodate equestrian and bicycle traffic. The widened trail will serve as a detour for other trails which will be closed during construction activities associated with Dike 6 and the Right Wing Dam The widening effort is anticipated to begin in February and be complete by December 2020.

Three elderberry shrubs are located along the Pioneer Express Trail. The driplines of the shrubs are less than 20 feet from where the trail widening will occur. However, all of the elderberry shrubs are located on the west or south side of the existing trail and the widening activities will occur to the east or north to avoid disturbance of the shrubs.

Based on implementation of the Conservation Measures identified in the biological opinion and additional measures proposed in this reinitiation, the Corps has determined widening of the Pioneer Express Trail may affect, but is not likely to adversely affect the beetle or its habitat. Pursuant to Conservation Measure 2 in the biological opinion, the Corps is also seeking approval from the Service to establish a buffer around an elderberry shrub less than 20 feet.

The Service concurs with the Corps' determination that widening of the Pioneer Express Trail may affect, but is not likely to adversely affect the beetle or its habitat. The Service also agrees to the Corps' proposal of a minimum setback less than 20 feet for three elderberry shrubs along the existing trail. The biological opinion will be amended to reflect these changes. To provide ease of reading, the new language in the biological opinion will be in bold text. Therefore, the Folsom Dam Raise Project biological opinion is amended as follows:

Page 2. Consultation History

April 9, 2014:	The Service, Reclamation, and the Department of Water Resources conducted an elderberry shrub survey of the proposed project footprint.
September 6 2016:	The Service received the September 6, 2016, letter from the Corps requesting reinitiation of formal consultation with undated biological assessment.
September 9, 2019:	The Service received a request (undated) to reinitiate consultation related to moving the location of the Folsom Residence Office for the proposed project and establishing a minimum setback (buffer) of less than 20 feet for a single elderberry shrub along the road to the proposed Folsom Resident Office site.
December 16, 2019:	***The Service received a request dated December 10, 2019, to reinitiate consultation related to widening the Pioneer Express Trail to serve as a detour for trails that will be closed during construction activities at Dike 6 and the Right Wing Dam and establishing a minimum setback (buffer) of less than 20 feet for three elderberry shrubs along the trail proposed for widening.***
January 9-14, 2020:	***The Corps and Service exchanged emails providing clarification on the project description and additional conservation measures for the widening Pioneer Express Trail portion of the project.***

Page 4. Earthen Raise Elements

As with Dikes 1, 2, and 3, the proposed modifications to Dikes 4, 5, and 6 will also primarily affect the existing crest and landward side slopes of these dikes through the removal of existing materials (ex. Riprap, earthen materials, roadway pavement, roadway gravel) and the addition of new materials (ex. engineered fill, riprap, pavement). An existing gravel road/trail currently extends from the south end of Dike 4 to the north end of Dike 5. A significant portion of this road will be raised to the same elevation se the proposed raised crest elevation of the adjacent dikes because the affected road segments are presently lower than the necessary dike elevation. Gravel maintenance roads currently run along the landward side toe of the dikes to the landward side slopes of the dikes. Portions of these maintenance roadways will be relocated in a manner that mimics their current alignments to accommodate changes in the side slopes of the dikes. **In addition, some existing trails in the vicinity of Dike 6 used by pedestrians, equestrians and bicyclists will be closed during construction. A detour will be provided by widening a 2,300-foot-long segment of the Pioneer Express Trail.**

Page 6. Concrete Floodwall Elements

There will be two construction access points for work on the RWD (see Enclosure, Figure 9). One will be off Auburn-Folsom Road at the Beal's Point roadway (e.g. the same access point used to access the southern end of Dike 6). S**ome existing trails in the vicinity of Dike 6 used by pedestrians, equestrians and bicyclists will be closed during construction of the RWD. A detour will be provided by widening a 2,300-foot-long segment of the Pioneer Express Trail.** The other access point will be off Folsom-Auburn Road at Folsom Dam Road. The construction access/haul route from this access point will follow established roads within Reclamation's CCAO Facilities. The main construction access point for work on the LWD will be off Folsom Lake Crossing at the existing Gate 1 construction access (see Enclosure, Figure 10). The construction access/haul route from this access point will follow an existing haul road before passing over the control structure of the new auxiliary spillway. During construction work on the LWD and RWD, one lane of the existing road that runs from the LWD to the main dam and then to the RWD (e.g. Folsom Dam Road) will be open to traffic.

Page 9. Conservation Measures

The following conservation measure is added:

11. Specific to the widening of the Pioneer Express Trail:
a. work will not occur during the flight season for the beetle (March-July);
b. trail work within 20 feet of the dripline of elderberry shrubs will be conducted by hand crews only.

All other sections of the October 13, 2016, biological opinion and September 20, 2019, reinitiation for the Folsom Dam Raise Project remain the same. If you have any questions regarding this biological opinion please contact Doug Weinrich (douglas_weinrich@fws.gov), Assistant Field Supervisor, at (916) 414-6563.

Sincerely,

Doug Weinrich

Subject: Reinitiation of Formal Consultation on the Proposed Folsom Dam Raise Project, Sacramento, El Dorado and Placer Counties, California

Dear Mr. Ziminske:

This letter is in response to the Corps of Engineers' (Corps) January 27, 2020, request for reinitiation of formal consultation with the U.S. Fish and Wildlife Service (Service) on the proposed Folsom Dam Raise Project (proposed project) in Sacramento, El Dorado, and Placer Counties, California. Your request was received by the Service on January 30, 2020. The Service issued a biological opinion for this project on October 13, 2016 (08ESMF00-F-0043) and subsequent reinitiations of consultation on September 20, 2019 (08ESMF00-F-0043-R001), and January 15, 2020 (08ESMF00-F-0043-R002), that analyzed the project's effects on the federally-listed as threatened valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*) (beetle). This response is provided under the authority of the Endangered Species Act of 1973, as amended (16 U.S.C. 1531 *et seq.*) (Act), and in accordance with the implementing regulations pertaining to interagency cooperation (50 CFR 402).

Since the Service issued the biological opinion and two reinitiations, the Corps re-surveyed a 2-mile section of the Pioneer Express Trail and other trails north of Beal's Point Road for the presence of elderberry shrubs. These trails are scheduled to be widened from about 2 feet to 4-6 feet to accommodate equestrian and bicycle traffic and will serve as a detour for other trails which will be closed during construction activities associated with Dikes 4-6. The widening effort is anticipated to begin in February and be complete by December 2020.

A new elderberry shrub was located along the Pioneer Express Trail just north of Beal's Point Road. The driplines of the shrub is less than 20 feet from where the trail widening will occur. However, the elderberry shrub is located on the west side of the existing trail and the widening activities will occur to the east to avoid disturbance of the shrub.

Based on implementation of the Conservation Measures identified in the biological opinion and additional measures proposed in this reinitiation, the Corps has determined widening of this section of the Pioneer Express Trail and other trails north of Beal's Point Road may affect, but is not likely to adversely affect the beetle or its habitat. Pursuant to Conservation Measure 2 in the biological opinion, the Corps is also seeking approval from the Service to establish a buffer around an elderberry shrub less than 20 feet.

The Service concurs with the Corps' determination that widening of the Pioneer Express Trail and other trails north of Beal's Point Road may affect, but is not likely to adversely affect the beetle or its habitat. The Service also agrees to the Corps' proposal of a minimum setback less than 20 feet for the single elderberry shrub along the existing trail. The biological opinion will be amended to reflect these changes. To provide ease of reading, the new language in the biological opinion will be in bold text. Therefore, the Folsom Dam Raise Project biological opinion is amended as follows:

Page 2. Consultation History

April 9, 2014:	The Service, Reclamation, and the Department of Water Resources conducted an elderberry shrub survey of the proposed project footprint.
September 6 2016:	The Service received the September 6, 2016, letter from the Corps requesting reinitiation of formal consultation with undated biological assessment.
September 9, 2019:	The Service received a request (undated) to reinitiate consultation related to moving the location of the Folsom Residence Office for the proposed project and establishing a minimum setback (buffer) of less than 20 feet for a single elderberry shrub along the road to the proposed Folsom Resident Office site.
December 16, 2019:	The Service received a request dated December 10, 2019, to reinitiate consultation related to widening the Pioneer Express Trail to serve as a detour for trails that will be closed during construction activities at Dike 6 and the Right Wing Dam and establishing a minimum setback (buffer) of less than 20 feet for three elderberry shrubs along the trail proposed for widening.
January 9-14, 2020:	The Corps and Service exchanged emails providing clarification on the project description and additional conservation measures for the widening Pioneer Express Trail portion of the project ***south of Beal's Point Road.***
January 30, 2020	***The Service received a request via email dated January 27, 2020, to reinitiate consultation related to widening the Pioneer Express Trail and other trails north of Beal's Point Road to serve as a detour for trails that will be closed during construction activities at Dikes 4-6 and establishing a minimum setback (buffer) of less than 20 feet for a newly discovered elderberry shrub along the trail proposed for widening***

Page 4. Earthen Raise Elements

As with Dikes 1, 2, and 3, the proposed modifications to Dikes 4, 5, and 6 will also primarily affect the existing crest and landward side slopes of these dikes through the removal of existing materials (ex. Riprap, earthen materials, roadway pavement, roadway gravel) and the addition of new materials (ex. engineered fill, riprap, pavement). An existing gravel road/trail currently extends from the south end of Dike 4 to the north end of Dike 5. A significant portion of this road will be raised to the same elevation se the proposed raised crest elevation of the adjacent dikes because the affected road segments are presently lower than the necessary dike elevation. Gravel maintenance roads currently run along the landward side toe of the dikes to the landward side slopes of the dikes. Portions of

these maintenance roadways will be relocated in a manner that mimics their current alignments to accommodate changes in the side slopes of the dikes. In addition, some existing trails in the vicinity of **Dikes 4-6** used by pedestrians, equestrians and bicyclists will be closed during construction. A detour will be provided by widening a 2,300-foot-long segment of the Pioneer Express Trail **south of Beal's Point Road and a 2-mile-long segment of the Pioneer Express Trail and other trails north of Beal's Point Road.**

Page 6. Concrete Floodwall Elements

There will be two construction access points for work on the RWD (see Enclosure, Figure 9). One will be off Auburn-Folsom Road at the Beal's Point roadway (e.g. the same access point used to access the southern end of Dike 6). Some existing trails in the vicinity of Dike 6 used by pedestrians, equestrians and bicyclists will be closed during construction of the RWD. A detour will be provided by widening a 2,300-foot-long segment of the Pioneer Express Trail.

The other access point will be off Folsom-Auburn Road at Folsom Dam Road. The construction access/haul route from this access point will follow established roads within Reclamation's CCAO Facilities. The main construction access point for work on the LWD will be off Folsom Lake Crossing at the existing Gate 1 construction access (see Enclosure, Figure 10). The construction access/haul route from this access point will follow an existing haul road before passing over the control structure of the new auxiliary spillway. During construction work on the LWD and RWD, one lane of the existing road that runs from the LWD to the main dam and then to the RWD (e.g. Folsom Dam Road) will be open to traffic.

Page 9. Conservation Measures

The following conservation measure is added:

11. Specific to the widening of the Pioneer Express Trail and other trails:
a. to the extent feasible, all activities that occur within 50 meters (165 feet) of elderberry shrubs will be conducted outside the flight season of the beetle (March-July);
b. trail work within 20 feet of the dripline of elderberry shrubs will be conducted by hand crews only (no heavy equipment).

All other sections of the October 13, 2016, biological opinion and the September 20, 2019, and January 15, 2020 reinitiations for the Folsom Dam Raise Project remain the same. If you have any questions regarding this biological opinion please contact Doug Weinrich (douglas_weinrich@fws.gov), Assistant Field Supervisor, at (916) 414-6563.

Sincerely,

Doug Weinrich

for Jennifer M. Norris, Ph.D.
Field Supervisor

CESPK-PDR-A 6/2/21

MEMORANDUM FOR RECORD

SUBJECT: USFWS Concurrence with Oak Tree Mitigation and Valley Elderberry Longhorn Beatle (VELB) Determination Associated with the Folsom Dam Raise Modifications Project, Folsom, California

ATTN:
Ms. Jennifer Hobbs
Sacramento Fish and Wildlife Office
U.S. Fish and Wildlife Service
2800 Cottage Way, Room W-2605
Sacramento, CA 95825

1. **Locations:** The oak planting locations for mitigation are located in the areas designated in Figurers 2 through 7 below. The locations of all impacted elderberry shrubs are listed in Table 2. All locations are within the Folsom Lake State Recreation Area in Folsom, California.

2. **Project Background:** The Folsom Dam Raise project was authorized under section 101(a)(6) of the Water Resources Development Act of 1999 (Public Law 106-53), Section 128 of the Energy and Water Development Appropriations Act of 2004 (Public Law 108-137), and Section 3029(b) of the Water Resources Development Act of 2007 (Public Law 110-114). The Folsom Dam Raise project was reevaluated jointly with the Folsom Modification Project in the American River Watershed Project Post Authorization Change Report (PACR) for the American River Watershed Project dated March 2007. The PACR resulted in the recommendation of an auxiliary spillway at the Folsom Dam – which was constructed jointly with the USBR – known as the Folsom Joint Federal Project (JFP). In addition to the JFP, the PACR resulted in the authorization of the Folsom Dam Raise project This MFR is a request for concurrence with our determination that construction of the proposed Folsom Dam Raise Modification project may affect, but is not likely to adversely affect, the Federally listed valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*)(VELB) in accordance with Section 7 of the Endangered Species Act. Additionally, this MFR details the plan to mitigate for oak woodland habitat that would be removed for construction by planting native oaks at 10 separate onsite locations in accordance with the April 20, 2015 Fish and Wildlife Coordination Act Report for the Folsom Dam Raise Project (ref. #FF08ESMF00-2014-CPA-0010). Our most recent consultation with your office on this project was the Biological Opinion titled Reinitiation of Formal Consultation on the Proposed Folsom Dam Raise Project, Sacramento, El Dorado, and Placer Counties, California dated September 20, 2019 (ref. #08ESMF00-2017-F-0043-R001).

3. **National Environmental Policy Act (NEPA) Compliance Background:** The Folsom Dam Raise was evaluated in the 2007 Final Folsom Dam Safety and Flood Damage Reduction Environmental Impact Statement/Environmental Impact Report (EIS/EIR) and in a 2017 Supplemental Environmental Impact Statement/Environmental Impact Report (SEIS/SEIR). A draft SEIS/EIR for this and other changes since the 2017 SEIS/EIR is currently in routing.

4. **MFR Purpose:** The proposed action would involve (1) raising the dikes and dams by 3.5 feet and includes constructing a new earthen embankment for Dike 3, earthen raise of Dikes 2 and 7, concrete floodwall raises for Dike 1, Dikes 4-6, the Left Wing Dam (LWD), the Right Wing Dam (RWD), and the Mormon Island Auxiliary Dam (MIAD); (2) onsite borrow and disposal at MIAD West; (3) rock crushing operations at MIAD East; (4) modification of the Main Dam Tainter Gates, and (5) a project mitigation and restoration plan. Construction is anticipated to begin in early 2022 and continue through 2025. See Table 1 below for the current anticipated construction schedule.

Table 1. Anticipated construction schedule for the Folsom Dam Raise Modifications Project.

Project Activity	Starting Year	Ending Year	Duration
Main Dam Tainter Gates & related structural refinements LWD & RWD – concrete floodwall raises	2022	2025	4 years
Dike 7 and MIAD – concrete floodwall raises	2022	2024	2 years
Dikes 1, 4, 5, & 6 – concrete floodwall raises Dikes 2 - earthen embankment raise New Dike 3 – earthen embankment construction	2022	2024	2 years

No designated critical habitat for listed species is found within the project area. However, elderberry shrubs are located throughout the project (see Fig. 1). Although no elderberry trimming, transplantation, or other associated mitigation would be necessary for the current design, some construction activities would take place within the 100 ft buffer and a few within the 20 ft buffer from the dripline of elderberry shrubs (see Table 2). Although ground disturbing activities would take place within the 100 ft buffer for some elderberry shrubs, no ground disturbing activities would take place within the 20 ft buffers that have not already been covered by previous consultations (e.g. detour trail construction). The primary activity that would take place within the 20 ft buffers would be haul trucks and equipment driving by elderberry shrubs on adjacent haul routes. Many of these haul routes are currently subject to daily vehicle traffic associated with public recreation and State Parks personnel activities.

Figure 1: Elderberry locations throughout the Folsom Dam Raise Modifications Project

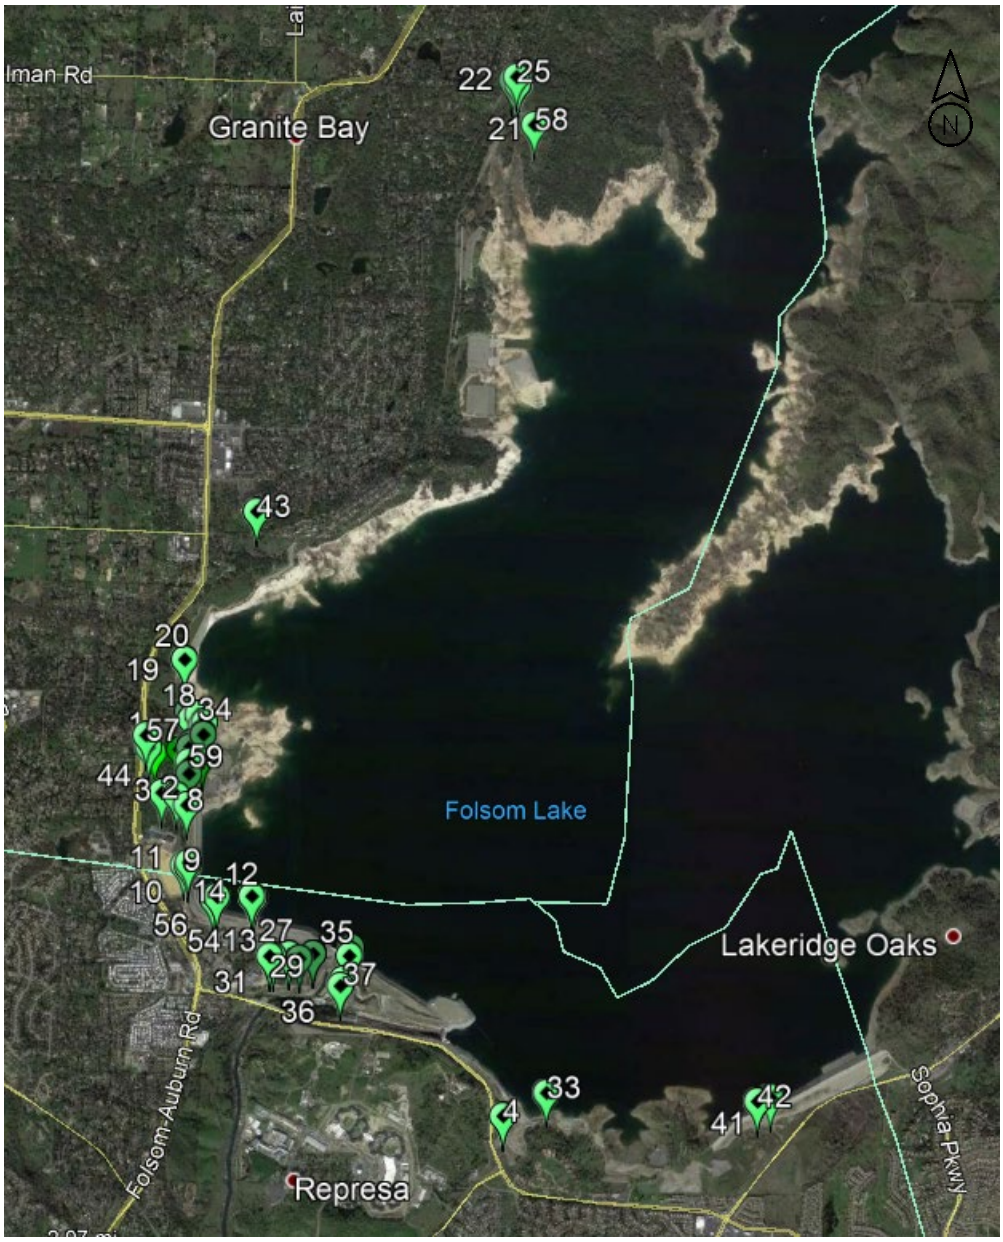

Table 2. Locations and anticipated impacts to existing elderberry shrubs within or near the limits of the proposed project.

Shrub ID	General Location	Latitude	Longitude	Project Impact Anticipated	Work Within 20 ft or 100 ft of Dripline

Avoidance and minimization procedures for VELB are clearly outlined in the 2017 Folsom Dam Raise SEIS/SEIR and the 2021 Folsom Dam Raise Modifications Draft SEIS/EIR (in review) and would be followed by the contractor and USACE personnel. These include:

A. Construction personnel would receive USFWS approved worker environmental awareness training to ensure that workers recognize elderberry shrubs and the VELB. The training would include: the protected status of VELBs and their host plants, elderberry shrubs; the need to avoid adversely affecting elderberry shrubs; elderberry shrub avoidance areas (protective buffers/exclusion zones); measures to be taken by workers during construction to protect elderberry shrubs; possible penalties that could be imposed for not complying with requirements established for the protection of elderberry shrubs and the VELB.

B. Where practicable, a minimum setback (buffer) of 100 feet from the dripline of all elderberry shrubs containing stems measuring 1.0 inch or greater in diameter at ground level would be established. There may be instances where a 100-foot buffer is not practicable due to various constraints. In such cases, a buffer of at least 20 feet from the dripline of such elderberry shrubs would be established if feasible. The Corps will consult with USFWS prior to establishing any elderberry shrub buffer zones (setbacks) that extend less than 100 feet from the dripline of a particular shrub. Prior to project construction activities near elderberry shrubs to be preserved, temporary protective barriers would be installed along the limits (boundaries) of approved elderberry shrub buffer zones (exclusion areas). No construction activities or similar disturbances would be allowed within the elderberry shrub buffer zones unless authorized in advance by the Corps and USFWS. In situations where elderberry shrubs to be preserved are located more than 100 feet from the project's limits of construction, protective barriers may not

be installed if existing landscape conditions are such that inadvertent damage to the shrubs during construction is unlikely. The contractor would install signs approximately every 50 feet along the edge of any protective structural barriers. The signs would include the text: "This area is the habitat of the valley elderberry longhorn beetle, a threatened species, and must not be disturbed. This species is protected by the Endangered Species Act of 1973, as amended. Violators are subject to prosecution, fines, and imprisonment." The signs would be readable from a distance of 20 feet and would be maintained during project construction.

The first purpose of this MFR is to request consultation on activities associated with "B" above for ground disturbing construction activities to take place within 100 ft and construction traffic to drive within 20 feet of the dripline of the elderberry shrubs as listed in Table 2 as long as 1) all of the contractor training and avoidance and minimization measures mentioned in "B" above are followed by USACE and the contractor(s), 2) protective barriers are placed as far from the dripline of elderberry shrubs as practicable, and 3) in cases where elderberry shrubs are immediately adjacent to roadways, protective fencing would be placed up to but not within the dripline of the elderberry shrub.

The second purpose of this MFR is to detail the anticipated oak woodland mitigation as described in the 2021 Folsom Dam Raise Modifications Draft SEIS/EIR (in review). Oak woodland habitat removed for construction is estimated to at approximately 12.3 acres. Mitigated at a 1.2:1 ratio, this equates to approximately 14.8 acres of native oak plantings required for mitigation. This calculation includes trees that have been removed for the construction of Dike 8 (complete) and trees that are anticipated to be removed for clearing staging and construction areas for Dikes 1-6. No tree removal is anticipated for Dike 7, RWD, LWD, Main Dam, or MIAD. The oak plantings at the MIAD West borrow site cover 8.8 acres. Disturbance of the oak plantings would be avoided as much as practicable and any disturbance of those plantings would be mitigated at a 1:1 ratio. Therefore, the total acreage of all oak plantings required for mitigation would be approximately 23.6 acres. These impacts would be mitigated by planting native oaks in the areas designated in Figures 2 through 7 below. The total acreage for all proposed oak planting sites equates to approximately 24.8 acres and would be planted at a density of approximately 170 trees per acre. The contractor responsibilities would include planting, watering, protecting, monitoring, and maintain areas for a minimum of 4 years with a survival goal on average density of at least 25 living native oak trees per acre planted. Beyond the 4-year minimum monitoring, it would be the responsibility of State Parks and the U.S. Bureau of Reclamation to maintain the oak plantings in perpetuity. The additional 1.2 acres beyond the mitigation acreage required accounts for

the fact that a road, trails, and a few existing trees and shrubs are found within the proposed planting sites where trees would not be planted.

Figure 7. Proposed Oak Tree Planting Mitigation Area 10 (2.93 acres).

CESPK-PDR-A
SUBJECT: Folsom Dam Raise Modifications Project, Oak Tree Mitigation and VELB Determination Concurrence for the Folsom Dam Raise Modifications Project, Folsom, California

Based on the implementation of the avoidance and minimization measures described above for VELB, we request your concurrence with our determination that the proposed Folsom Dam Raise Modifications project may affect, but is not likely to adversely affect, the VELB and its habitat. Thank you for your attention to this matter.
